5832. **Newman, Klaus M., & Davis, Anne R. (USN Electronics Lab., San Diego, Calif.) Relative merits of spatial and alphabetic encoding of information for a visual display.** *J. engng. Psychol.*, 1962, 1(3), 102-126.—Speed and accuracy of operator performance in search and identification tasks were assessed along a continuum from purely alphabetic to purely spatial coding. Partial spatial coding resulted in good performance regardless of the task. Complex spatial coding improved response speed in localization of messages. Some operators profited by the addition of labels to the spatial code on the display.—*D. C. Hodge.*

5833. Roman, J. A., Warren B. H., Niven, J. I., & Graybiel, A. Some observations on the behavior of a visual target and a visual after-image during parabolic flight maneuvers. *USAF SAM tech. docum. Rep.*, 1962, No. 62-66. 8 p.—3 Ss were exposed to accelerations above and below 1 g in high-performance aircraft. Under these conditions a real target (RT) appears to be displaced upward from center for accelerations greater than 1 g positive and downward for accelerations less than 1 g positive. A visual after-image (VAI), when observed in the absence of a real target, appears to be displaced from center in a direction opposite to that observed for a real target. Fixating on a RT in the presence of a VAI results in movement of both the RT and the VAI concurrently in the fashion described for a real target. Apparent change in the position of a VAI can be brought about by voluntary eye movements but apparent position of a RT is unaffected by voluntary eye movements. Apparent displacement of a VAI or a RT usually occurs within less than 5 seconds from the time the change in acceleration is initiated.—*M. C. Payne, Jr.*

5834. Sadacca, R., Ranes, J. E., & Schwartz, A. I. Human factors studies in image interpretation: Vertical and oblique photos. *USA Personnel Res. Off. OCRD tech. res. Note*, 1961, No. 120. 16 p.—The value to image interpreters of examining both vertical and oblique views of a target area rather than views of either type alone was explored. 109 recent graduates from the Image Interpretation Course, Fort Holabird, Maryland, were divided into 5 experimental groups matched on final course grades and on general aptitude test scores. Tasks were varied so as to provide a basis for comparing performance when either vertical or oblique photos were used alone and when the 2 types of photos were used in combination. Findings showed: (a) no significant differences in number of correct identifications when interpreters had both types of photos or either type alone, (b) more misidentifications when a 2nd type of photo was provided after an initial viewing period of a single type, and (c) changing order of imagery presentation did not appear to affect performance. This exploratory study indicates that having both vertical and oblique photos of a target area does not necessarily make for improved interpreter performance. A more comprehensive study is suggested in which such factors as scale, quality, and content of photos are systematically varied.—*A. J. Drucker.*

5835. Siegel, A. I., Miehle, W., & Federman, P. Information transfer in display control systems: IV. Summary review of the DEI technique. Wayne, Pa.: Applied Psychological Services, 1962. vi, 76 p.—The logic and basis of a quantitative, objective index for evaluating the information transfer characteristics of the displays in display-human operator-control systems are presented. The logic was derived from communications theory. The 1st year's work on this display evaluative technique suggests that it represents a useful tool for aiding in the selection of an equipment design from several alternative early designs and that the reliability and validity measurements, with the outside criterion employed, are acceptable and satisfactory.—*P. Federman.*

5836. Sorenson, Richard C., & Towe, Arnold L. (U. Washington) Nonrandom tendencies in interpolating between end-points. *J. appl. Psychol.*,

1962, 46(5), 337-340.—6 Ss' estimates of the position within a 2-4 mm. interval were analyzed and found to be nonrandomly distributed among the decimals of the interval, even though the original data were uniformly distributed. Each S was highly consistent in his pattern of decimal selection over time. The patterns for different Ss were remarkably similar; decimals near the end-points of the interval were chosen at the expense of those in the interior of the interval. The position of the end-points was largely responsible for the nonrandom selection observed, for the numbers "preferred" could be altered by altering the end-points. The S's knowing of this phenomenon had some effect on the magnitude of the tendency, but did not eliminate it.—*Journal abstract.*

5837. White, William J. (Cornell Aeronautical Lab., Buffalo, N. Y.) Quantitative instrument reading as a function of illumination and gravitational stress. *J. engng. Psychol.*, 1962, 1(3), 127-133.—Effect of acceleration (1-4 g) on reading instrument dials under luminance levels of 0.004 to 42 mL was determined for 6 experienced Ss using the Wright Air Development Center human centrifuge. Increased error scores were observed for low luminance combined with low acceleration. Increase in errors at 4 g over 1 g was roughly equivalent to that due to reduction in luminance by 1 log unit.—*D. C. Hodge.*

5838. Wiener, Earl L. (U. Miami) Motion prediction as a function of target speed and duration of presentation. *J. appl. Psychol.*, 1962, 46(6), 420-424.—This study investigated the ability of Ss to predict the future position of a moving target after the target disappeared. Target speed, duration of target exposure, and S's mode of responding to the visible target were varied. The performance measure was the absolute deviation from the correct target position at the end of 9 sec., converted to error relative to target speed. Results show: (a) no significant differences resulting from mode of response (tracking vs. monitoring), order of presentation, duration of presentation, or speed-duration interaction; (b) significant learning effect from session to session ($p < .01$); and (c) an increase in relative error, in an inverse relation to target speed ($p < .01$). It is concluded that a human operator may be able to make motion predictions equally as well with minimal as with maximal exposure to target input; only target speed exerts an influence on prediction accuracy.—*Journal abstract.*

5839. Wright, A. D., & Baldwin, R. D. Target detectability on an A-scope as influenced by vertical and horizontal video amplification. *HumRRO res. Memo.*, 1962, Subtask Vigil II. 12 p.—To increase radar operator efficiency, a study probed "detectability of targets-in-jamming of vertical and horizontal amplification of the video presented on an A-type radar indicator." Results agreed with established views with respect to "use of horizontal amplification" but were contrary to those concerning "the effect of vertical amplification."—*R. Tyson.*

Controls

5840. Graham, Dunstan, & McRuer, Duane. (Systems Technology, Inc.) Analysis of nonlinear control systems. New York: Wiley, 1961. xiii, 482 p. \$9.75.—"This book is concerned with practi-

cal methods of engineering analysis for nonlinear control systems." Introductory material includes equations of control systems, classification of nonlinearities, behavior of nonlinear systems, and general techniques for solving nonlinear problems. The bulk of the book covers: "a general theory of 'quasi-linear' systems (for the description of periodic and random input behavior), and topological phase space techniques (for the description of transient behavior)." The concluding chapter includes discussion of the human controller as a nonlinear system. 4 appendices with working charts are provided to assist analysis.—C. A. Bennett.

5841. Minor, Frank J., & Revesman, Stanley L. (International Business Machines Corp., Endicott, N. Y.) **Evaluation of input devices for a data setting task.** *J. appl. Psychol.*, 1962, 46(5), 332-336.—This study evaluates a set of numeric manual entry devices. The task required was to set numeric data into the devices. The devices evaluated in this study were: a 10-key keyboard, levers, a matrix keyboard, and rotary knobs. The criteria by which the devices were evaluated were: error rate, entry time, and operator preferences. A repeated measurement design was utilized. Each of 24 subjects made 175 10-digit entries into each of the 4 devices. The conclusions based upon the data are: (a) the 10-key keyboard yields a significantly lower error rate and is significantly preferred compared to the other devices. This device required significantly less time per entry compared to the level and rotary knobs. (b) The matrix device required significantly less time per entry and was significantly preferred compared to the level and rotary knobs. The matrix device does not result in a significantly lower error rate than the latter 2 devices. (c) There were no significant differences between the lever and rotary knob devices.—*Journal abstract.*

5842. Nordström, L. (Saab Aircraft Co., Sweden) **Tracking performance of a manual aircraft fire-control system: Influence of radar noise, low-pass filtering, and quickening.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 5. Industrial and business psychology* (see 37: 4120). Pp. 194-213.—Studies in a simulated control system are presented. "... radar noise in an aircraft fire control system introduces a random type motion into the steering signal." Numerous resulting problems are described.—B. T. Jensen.

5843. Obermayer, R. W., Swartz, W. F., & Muckler, F. A. (Martin-Marietta Corp.) **Interaction of information displays with control system dynamics and course frequency in continuous tracking.** *Percept. mot. Skills*, 1962, 15(1), 199-215.—Skilled Ss performed single dimension tracking with all combinations of following and compensatory modes of information display, position, rate, and acceleration control system dynamics, and 3 frequencies of a complex tracking course. The data show that a high degree of interdependency exists between the effects of the 7 experimental measures. Description of the interaction between the effects of display, dynamics, and course is complicated as the results differ from measure to measure.—W. H. Guertin.

5844. Sharp, Earl D. **Maximum torque exertable on knobs of various sizes and rim surfaces.**

USAF MRL tech. docum. Rep., 1962, No. 62-17. iii, 11 p.—We initiated this study to determine the maximum torque a seated operator can apply in turning a knob with the bare thumb and fingertips of his right hand. We also wanted to develop a procedure by which a given knob or set of knobs may be evaluated with respect to maximum torque exertable. A set of 60 knobs, each $\frac{1}{2}$ -inch thick, was used. The knobs had 20 diameters from $\frac{1}{4}$ to 5 inches. For each diameter there were 3 different rim surfaces: smooth, rectangular-knurl, and diamond-knurl. Each of 45 Ss was tested with every diameter-surface combination. In addition, 15 of the Ss repeated the experiment. The maximum torque exertable increased with knob diameter. For all knob sizes, rectangular- and diamond-knurl knobs permitted greater torques than did smooth knobs. Very little difference in maximum torque exertable was observed between the rectangular- and diamond-knurl surfaces.—*USAF MRL.*

SIGNS & LEGIBILITY

5845. Harcum, E. Rae, & Jones, Mary Linda. (Coll. William & Mary) **Letter recognition within words flashed left and right of fixation.** *Science*, 1962, 138(Whole No. 3538), 444-445.—Neural activity related to eye movements has been proposed as a reason for superior recognition of words to the right of fixation. Predictions from such propositions were verified in our experiment. The distribution of recognition errors among letter positions on the left is relatively symmetrical, while the distribution on the right increases from fixation.—*Journal abstract.*

5846. White, B. W. (Massachusetts Inst. Technology) **Recognition of familiar characters under an unfamiliar transformation.** *Percept. mot. Skills*, 1962, 15(1), 107-116.—20 Ss were asked to identify alpha-numeric characters which had been subjected to repeated transformations by a 2-dimensional random walk, with 3 different step sizes. The percentage of correct identifications declined regularly with the number of transformations the character had undergone. The larger the step size, the more rapid was this decline with each succeeding transformation.—W. H. Guertin.

DRIVING, ACCIDENTS, SAFETY

5847. Ancelin-Schutzenberger, Anne. **Quelques aspects psycho-sociologiques de l'étude des accidents.** [Some psychosocial aspects of the study of accidents.] *Bull. Cent. Etud. Rech. Psychotech.*, 1961, 10(4), 455-472.—Recent studies on accidents are reviewed. The composition of the group, its attractiveness, perception of goals, its security, and its creativity are additional or essential factors in predisposition towards accidents.—V. Sanua.

5848. Brickenkamp, Rolf. (Möllenberg 1, Essen-Werden, Germany) **Bewährungsstudie über die Aussagekraft von Leistungstests zum Problem der Kraftfahreignung.** [Validity study of tests used in driver-evaluation.] *Z. exp. angew. Psychol.*, 1962, 9(2), 165-175.—A discussion of criteria for safe driving introduces the validity study of the Bennett Mechanical Comprehension Test and a detail discrimination test (Brickenkamp Test d2). Both tests were effective in discriminating between drivers and persons who failed the driver examination 2 or more times.—W. J. Koppitz.

5849. Hampel, B. (Mainz, Rheinallée 85) **Untersuchungen zur Beziehung zwischen Fahrtauglichkeit und Intelligenzniveau.** [A study to determine the relationship between driver fitness and intelligence level.] *Psychol. u. Praxis*, 1962, 6(1), 1-13.—Data were available from driver examinations for 1207 Ss between the ages of 18 and 49 relative to the relationship between intelligence and driver fitness. Criteria of driver fitness were based upon licensing examinations and traffic accident rate. It was concluded that intelligence, as measured by Hamburg-Wechsler Intelligence Test for Adults, and driver fitness were related. Further, truck drivers, the most able drivers, were found to score higher than other drivers.—H. Roemmich.

5850. Klebelsberg, Dieter. (Verkehrspsychologisches Inst., Vienna, Austria) **Unterschiedliche Auswirkungen einer Blutalkoholkonzentration von 1.0 Promille bei einzelnen psychischen Komponenten der Fahrtüchtigkeit.** [Differential effects of 1.0 per mil blood alcohol concentration upon different psychological components of driving ability.] *Z. exp. angew. Psychol.*, 1962, 9(1), 1-11.—Visual perception, reaction time, coordination, subjective evaluation of driving ability, and sudden adaptation to traffic obstacles were the functions tested under normal conditions and under the influence of alcohol. While the various sensory functions did not suffer much loss, the ability to react quickly in the simulation equipment was affected most under alcohol. But the degree of deterioration was considerably influenced by driving proficiency in the normal state.—W. J. Koppitz.

5851. Leplat, J. **Psychologie expérimentale et étude des accidents.** [Experimental psychology and the study of accidents.] *Bull. Cent. Etud. Rech. Psychotech.*, 1961, 10(4), 473-487.—The theory of communication suggests a number of hypotheses to explain accidents, such as the superabundance of information which cannot be handled by the worker. Fatigue, anxieties, lack of familiarity with the machine, the phenomenon of negative transfer, automatization, regression, and underestimation of risks are considered. Thus concepts in experimental psychology could be utilized in understanding and preventing accidents.—V. Samua.

5852. Winkler, Werner. **Psychologische Beratung im Verkehrswesen.** [Consulting psychology for traffic problems.] *Psychol. Rdsch.*, 1962, 13(3), 199-207.—Psychological analysis can contribute in several areas of traffic problems. A perceptual analysis of driving can help the car-designer and the highway-engineer in adapting cars and highways to the limitations of the driver. Personality analysis and psychological evaluation of accidents can help in court decisions. Finally, psychological analysis can be useful in traffic education by separating emotional and personality factors from perceptual and motor defects.—W. J. Koppitz.

ADVERTISING & CONSUMER PSYCHOLOGY

5853. Amerine, M. A., Baker, G. A., & Ough, C. S. (U. California, Davis) **Confusion in sensory scoring induced by experimental design.** *J. food Sci.*, 1962, 27, 489-494.—8 experienced wine tasters used a 20-point scale to score 4 series of wines, each prepared by adding a different adulterant at 4 de-

tectably different concentrations. 2 designs were used: (a) replicate scoring of the 4 samples of 1 series at a session, and (b) 8 samples at a session randomized over series and levels. Each S scored each sample 4 times for each design. Both mean scores and variability differed among tasters for either design. With design (b) the scorings became biased in unpredictable ways and variability increased.—D. R. Peryam.

5854. Baker, G. A., Amerine, M. A., & Kester, D. F. (U. California, Davis) **Consumer preference on a rating basis for almond selections with allowance for environmental and subject-induced correlations.** *Food Technol.*, 1962, 16, 121-123.—5 types of almonds were served in pairs to students. Each member of the pair was rated on a 7-point hedonic scale. Significant correlations, higher for men than for women, were found between the paired ratings. When the data were analyzed without taking account of these correlations there were no significant differences between almond types or between sexes. The t test for correlated means established significant differences between almond types. Men seemed to be more discriminating than women.—D. R. Peryam.

5855. Benson, Purnell H. (Swarthmore, Pa.) **A short method for estimating a distribution of consumer preferences.** *J. appl. Psychol.*, 1962, 46(5), 307-313.—A brief questionnaire and statistical procedure is described for estimating the statistical distribution of consumer preferences for product variations along a single qualitative dimension. The fitting of data to ogive curves for skewed distributions is illustrated. Implications of distributions of consumer preferences for product planning and marketing strategy are suggested.—*Journal abstract.*

5856. Burril, L. M., Deethardt, D., & Saffle, R. L. (South Dakota Agricultural Experiment Station, Brookings) **Two mechanical devices compared with taste-panel evaluation for measuring tenderness.** *Food Technol.*, 1962, 16, 145-146.—6 panel members scored 82 cooked beef samples for tenderness and also counted the number of chews required to ready a ½-in. cube for swallowing. Mechanical measures were: Warner-Bratzler shear, Kramer-shear maximum force, and Kramer-shear total work. When data for all samples were combined, all inter-method correlations were highly significant. The correlation between number of chews and tenderness was -.91. Correlations between tenderness scores and the mechanical measures ranged from -.72 to -.83; those between number of chews and mechanical measures ranged from -.67 to .75.—D. R. Peryam.

5857. Cox, Donald F. (Harvard Business School) **Clues for advertising strategists.** *Harv. bus. Rev.*, 1961, 39(5), 160-176.—Some of the research findings of Carl Hovland and his associates in the area of communication and persuasion, as well as the work of Katz and Lazarsfeld on mass media, are reviewed in the light of the earlier assumptions of advertising psychologists. Implications for the planning of advertising programs are presented.—C. P. X. Youngberg.

5858. Cox, Donald F. (Harvard Business School) **Clues for advertising strategists: Part II.** *Harv. bus. Rev.*, 1961, 39(6), 160-182.—Studies illustrating the operation of 4 types of selective proc-

esses (exposure, perception, retention, and decision) are reviewed. 3 factors which interact to make an individual more (or less) predisposed to use these selective processes are discussed: (a) the physical and economic reality the individual experiences, (b) his personality, and (c) the social environment in which he lives. Some implications of research on mass communications for testing advertising effectiveness are presented. Festinger's theory of cognitive dissonance plays an important part in the discussion leading to a recommended strategy of "selective advertising."—C. F. X. Youngberg.

5859. Emery, F. E. (Tavistock Inst. Human Relations, London, England) **A heuristic model of the marketing process.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 5. Industrial and business psychology* (see 37: 4120). Pp. 172-181.—A model is described.—B. T. Jensen.

5860. Harrington, G., & Pearson, A. M. (U. Cambridge, England) **Chew count as a measure of tenderness of pork loins with various degrees of marbling.** *J. food Sci.*, 1962, 27, 106-110.—Samples were small wedges cut from cold fried chops. The end-point was defined as "the consistency at which the sample would normally be swallowed." 6 panel members were selected from 9 candidates on the basis of good reproducibility of chew counts in replicated tests. Loins from 36 pigs were divided into 18 "blocks" each containing a loin of high marbling and one of low marbling, as determined by visual examination. Each S tested samples from 3 blocks at a session. 5 Ss discriminated significantly between degrees of marbling. Average chew count correlated +.92 with Warner-Bratzler shear values, -.67 with marbling score, and -.57 with percentage of intramuscular fat.—D. R. Peryam.

5861. Katona, G. (U. Michigan) **Motivational research and the consumer.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 5. Industrial and business psychology* (see 37: 4120). Pp. 149-159.—Data are presented on consumer attitude and demand. An understanding of consumer psychology can be of aid in ironing out economic fluctuations.—B. T. Jensen.

5862. Micko, H. C. (Max-Planck-Inst. Arbeitspsychologie, Dortmund, Germany) **Die Bestimmung subjektiver Ähnlichkeiten mit dem semantischen Differential.** [The determination of similarities with the semantic differential.] *Z. exp. angew. Psychol.*, 1962, 9(2), 242-280.—2 questions are discussed: the selection of judgment criteria, and the measure of similarity. Methods for selecting the most representative sample of relevant, not predetermined criteria are pointed out. As a measure of similarity $s = \sum X_{ij}X_{ik}$ is proposed instead of the usual D^2 , since D^2 is more likely to show similarity among unclearly designated objects of judgment. A similarity analysis of textile fibers, given as an example, compares different variations of the Semantic Differential.—W. J. Koppitz.

5863. Naylor, James C. (Ohio State U.) **Deceptive packaging: Are the deceivers being deceived?** *J. appl. Psychol.*, 1962, 46(6), 393-398.—To investigate the effects of deceptive packaging, sample packages of potato chips containing various amounts were distributed to consumers who pur-

chased a regular pack of the same brand. The only difference between the sample and the purchased pack was in terms of quantity of chips with the sample packs having various deficits. Preference data were obtained via a follow-up interview. The analyses of the questionnaire data indicated that: (a) consumers did not perceive weight differences between packs, (b) all indices of consumer preference favored the free pack when the two were of equal weight, and (c) all indices showed a marked decrease in preference for the experimental pack as the contents of the experimental packs were decreased.—*Journal abstract.*

5864. Pace, R. Wayne. (Fresno State Coll.) **Oral communication and sales effectiveness.** *J. appl. Psychol.*, 1962, 46(5), 321-324.—The relationship between oral communication and sales effectiveness was investigated. 2 equatable groups of working sales people, a more effective "high" group and a less effective "low" group, were compared in terms of selected aspects of their communication behavior. Findings indicated that evaluations of basic oral communication skill (including listening) reliably differentiated between the 2 groups. Sales methods such as using "emotional appeals" and "dramatizing" also distinguished between the more effective and the less effective sales people. Results suggested: that evaluations of basic oral communication skill by a trained interviewer should be one valuable indicator of sales success; that communication training programs should subordinate fragmental, relatively isolated details of communication behavior to consideration of generalized communication skill; and that sales people who are inferior in basic oral communication skill will also be less effective in utilizing specialized persuasive techniques.—*Journal abstract.*

5865. Sawyer, F. M., Stone H., Abplanalp, H., & Stewart, G. F. (U. California, Davis) **Repeatability estimates in panel selection.** *J. food Sci.*, 1962, 27, 386-393.—Panels of 10-15 Ss made odor discrimination tests on milk vs. milk with added vanilla, using different test designs and extensive replication. Repeatability (intraclass correlation of repeated measures) was estimated directly from variance analysis for different designs, lengths of sessions, and groupings of Ss. Paired comparisons was found to be more sensitive than the triangle test. Long test sessions may provide a more reliable basis for panel selection than short-period testing. It is concluded that repeatability estimates can predict the proportion of judges whose sensitivity meets established specifications.—D. R. Peryam.

5866. Schwimmer, Sigmund, & Guadagni, D. G. (Albany, Calif.) **Relation between olfactory threshold concentration and pyruvic acid content of onion juice.** *J. food Sci.*, 1962, 27, 94-97.—Thresholds were established for juice from 22 lots of onions. For each, a series of 4 dilutions was made with tap water in the range 5-30 ppm, and these were tested by the duo-trio method by 12 Ss, each replicating 4 times. Threshold was defined as the concentration giving 70% correct responses. The correlation was -.97.—D. R. Peryam.

5867. Thumin, Frederick J. (Washington U.) **Identification of cola beverages.** *J. appl. Psychol.*, 1962, 46(5), 358-360.—An attempt was made to overcome certain methodological inadequacies of earlier

studies in determining whether cola beverages can be identified on the basis of taste. Some 79 Ss completed questionnaires on their cola drinking habits and brand preferences, then were tested individually on samples of cola beverages presented under methods of paired comparisons. Significant chi square values were obtained for Coca Cola and Pepsi Cola, due to the large number of correct identifications for these brands. Correct identification of Royal Crown, however, did not differ from chance expectancy. No significant relationship was found between ability to identify cola beverages and degree of cola consumption; nor were Ss any better at identifying their "regular" brand than they were other brands.—*Journal abstract.*

5868. Wærneryd, K. E. (Stockholm School Economics) **The use of scaling and standardized indirect methods in consumer interviewing.** In G. Nielson (Ed.), *Proceedings of the XIV International Congress of Applied Psychology. Vol. 5. Industrial and business psychology* (see 37: 4120). Pp. 161-171.—Marketing research is much less rigorous than industrial research generally. Several standardized procedures have been developed, namely, indirect method of assessing a product's social status, use of a constant sum to measure preferences, multiple-choice sentence completion, and the "Annoyances Test."—*B. T. Jensen.*

5869. Weckel, K. G., Martin, J. A., Lakama, Ralph, & Lyle, Margaret. (U. Wisconsin) **Effect of added sugar on consumer acceptance and physicochemical properties of canned cream-style corn.** *Food Technol.*, 1962, 16, 131-132.—Corn was prepared at 5 sugar levels: 5.5%, 8.2%, 10.8%, 13.4%, and 15.9%. Samples were distributed in pairs to 814 Madison families and 590 families in 15 central states. Corn was served hot at 2 different meals. All family members 10 years of age and over stated their preference and reasons for choice, if any. 10,397 responses were obtained. For flavor the Madison panel liked the 2 lowest levels of sugar equally; preference over the 3 higher levels was significant at the 1% level. Results were the same for the other panel except that the cut-off point was at the middle level. For appear-

ance, both panels liked the 2 lower levels equally; preference over higher levels was significant at the 1% level. The preferred corn was called "less sweet" and "brighter." No sex differences were found. The only age difference was higher preference by 10-16 year olds for the "sweeter" and "darker" samples.—*D. R. Peryam.*

5870. Yuson, Sonia M., & Francis, F. J. (U. Massachusetts, Amherst) **Relation between visual color differences and tristimulus color readings for pureed carrots, spinach, and pears.** *J. food Sci.*, 1962, 27, 295-302.—Ranges of colors were produced by blending samples of different colors and diluting with water. Visual just noticeable (color) differences (JNDs) were established by a panel of Ss using the triangle method. Differences were measured objectively using 6 types of colorimeters. Reproducible objective measurements lower than the JNDs were found only for spinach and pears and only for 2 colorimeters; other reproducible objective measurements were equal to, or higher than, the JND's.—*D. R. Peryam.*

5871. Zaehring, Mary V., & LeTourneau, Duane. (U. Idaho) **Textural quality of potatoes: I. Comparison of 3 organoleptic methods.** *Food Technol.*, 1962, 16, 131-134.—Mealiness of steamed potato cubes was judged under 3 conditions: by mouth, light mashing with a fork, and continued mashing to form a cohesive mass. The study included 36 different treatments and continued over a 2-year period. 8 to 10 panel members judged the samples, 4 or 5 at a session, against an arbitrarily chosen control using a 7-point rating scale whose categories represented degrees of greater or lesser mealiness than the control. An unmarked duplicate of the control was included in each set to be judged. All 3 methods discriminated among treatments. Light mashing was the most sensitive method. Its results correlated $\pm .96$ with the "by mouth" method. Continued mashing was least sensitive. Use of the labeled reference standard effectively stabilized the level of scores throughout the experiment. The correlation between mealiness scores and specific gravity was $\pm .92$.—*D. R. Peryam.*

BRIEF SUBJECT INDEX

This index supplements, but does not duplicate, the classification of abstracts given in the Table of Contents. It is assumed that the reader will have scanned whatever categories of classification interest him and that he will use this index only for cross references or for subjects that are more specific than the general categories of the classification. When many numbers are encountered under a heading, the reader may simplify his task by matching the numbers found under the two or more headings that specify his particular interest.

Psychological Abstracts

VOLUME 37

AUGUST 1963

NUMBER 4

EDITORIAL NOTES

The Research Division of the California Department of Mental Hygiene has begun publication of a quarterly, the *California Mental Health Research Digest*. "The purpose of the *Digest* is to report with speed, brevity, permanency and dignity, the scientific achievements of the Research Division, to insure the attention of investigators already inundated by a flood of publications."

* * *

The Color Science Association of Japan has begun the publication in English of *Acta Chromatica*. It is scheduled at present to be published annually. While devoted primarily to publications of studies by members of the association, contributions from abroad are cordially invited. The editor is R. Hioki, Department of Engineering, Tokyo University, Bunkyo-ku, Tokyo, Japan. Foreign subscription: \$2.00 annually, postage included.

GENERAL

5872. **Timaeus, Ernst.** (U. Köhn, Zülpicherstr. 182, Germany) *Über den Aufbau einer Lochkartenkartei psychologischer Literatur.* [On the assembly of a punched card file of psychological literature.] *Z. exp. angew. Psychol.*, 1962, 9(3), 509-517. —The problems connected with such a task are pointed out, especially the difficulty in getting agreement on a representative catalogue of psychological concepts.—*W. J. Koppitz.*

OBITUARIES

Truman Lee Kelley. *Brit. J. statist. Psychol.*, 1962, 15(1), 95-96.—Obituary.—*N. Earl.*

HISTORY & BIOGRAPHY

5874. **American Psychological Association. Distinguished Scientific Contribution Awards: 1962.** *Amer. Psychologist*, 1962, 17(12), 888-898.—Jerome Seymour Bruner, William Kaye Estes, and Harry Helson are honored for their outstanding scientific contributions. Each recipient receives a scroll citing the basis for the award and a check for \$1000. The citation, a brief professional biography, a photograph, and a complete list of scientific publications organized chronologically, are provided for each award recipient.—*S. J. Lachman.*

5875. **American Psychological Foundation. Gold Medal and Distinguished Science Writing Awards.** *Amer. Psychologist*, 1962, 17(12), 899-900.—The American Psychological Foundation Gold Medal was presented to Walter R. Miles, "Pioneer in the precise observation of human and animal behavior . . . prime mover in educating scientists . . . humane person devoted to others both in his personal relations and in

his research." The American Psychological Foundation Science Writing Award was presented to Gay Gaer Luce of Philadelphia "in recognition of newspaper and magazine accounts of recent psychological developments." Photographs of each recipient are included.—*S. J. Lachman.*

5876. **Burt, Cyril.** (University Coll. London, England) **Francis Galton and his contributions to psychology.** *Brit. J. statist. Psychol.*, 1962, 15(1), 1-41.—This commemorative review of Galton's life and numerous contributions to various sciences, particularly psychology, was prepared for presentation to the British Psychological Association on the 50th anniversary of Galton's death. The author's purpose is "not so much to record or repeat the well established facts, but rather to interpret them."—*N. Earl.*

5877. **Cardno, J. A.** (U. Tasmania) **Natural limits and change of content in the history of psychology.** *Psychol. Rec.*, 1962, 12(3), 289-298.—"By quotation from authorities at widely separated times, it is established that historians of psychology strive for a genetic and developmental view of their subject. Cross-sectional or latitudinal, and longitudinal approaches by two major historians to the delimitation of periods are contrasted. For a particular period (1797-1874), natural limits are arrived at, and the structure of these limits themselves is used to suggest a line of enquiry into the extent of change in psychology during the period. This change, amounting to about one half of the content of psychology, is briefly appraised. The mode of application of the method to particular authors is suggested."—*R. J. Seidel.*

5878. **Chmelař, V.** (Psychologická U., Brno, Czechoslovakia) **K šedesátinám Prof. Dr. Jana Doležala.** [Professor Doležal: 60 years.] *Českoslov. Psychol.*, 1962, 6(1), 110-115.—A review of the work of the director of the Psychological Institute of Charles University and the chief psychologist in Czechoslovakia. (Russian & English summaries)—*V. Bricháček.*

5879. **Mendoza, Rafael Thomas.** (Madrid, Spain) **La vida y la obra de Carlos Gustavo Jung.** [The life and work of Carl Gustav Jung.] *Rev. Psicol. gen. apl.*, 1961, 16(Whole No. 60), 737-764.—In the year of Jung's death, a biographical and critical memorial.—*E. B. Page.*

5880. **Michael, William B., Comrey, Andrew L., & Fruchter, Benjamin.** (U. California, Santa Barbara) **J. P. Guilford: Psychologist and teacher.** *Psychol. Bull.*, 1963, 60(1), 1-34.—A review of the life and contributions of one of the foremost psychologists of our time. The review covers the contributions of Guilford to experimental psychology—experimental esthetics, sensory processes, perception, and learning; statistical psychology—psychophysics, analysis, test theory and evaluation; measurement of

mental abilities—aptitudes of high level personnel, structure of the intellect, and creativity; and personality—tests, questionnaires, and inventories by Guilford and his associates. A complete bibliography shows that Guilford published either as sole author or as co-author 21 books; 29 monographs; 158 articles; and 21 tests, manuals, and profile sheets. A portrait of Guilford is included. (7-p. bibliogr.)—*Journal abstract.*

5881. Miles, Walter R. Carl Iver Hovland. In American Philosophical Society, *Year book: 1961*. Philadelphia, Pa.: APS, 1962. Pp. 121-125.—A biographical memoir.—*E. Y. Beeman.*

5882. Taylor, W. S. (Smith Coll.) *Psychoanalysis revised or psychodynamics developed?* *Amer. Psychologist*, 1962, 17(10), 784-788.—“When we survey not only the Freudian current but the entire psychodynamic stream, we find that most of Freud's good emphases had been or were being explicated by other workers, often with more penetration and discrimination.” Male hysteria, hysteria in little girls, and hysteria in women past the menopause (LePois, 1618); conflict and repression (Leibniz); the unconscious, including the supposed sexual core (Schopenhauer, 1819); complexes and relatively unified and divided personality (Herbart); scientific dream interpretation (Hippocrates). “Subsequent workers have verified more of Prince's perspective than of Freud's.” Encapsulation, isolation, and “cultism” among psychoanalytic workers are not as hopeful for science and humanity as “are mutual recognition and give-and-take between workers in a common enterprise.”—*S. J. Lachman.*

5883. Thomas, Dorothy Swaine. Samuel Andrew Stouffer. In American Philosophical Society, *Year book: 1961*. Philadelphia, Pa.: APS, 1962. Pp. 192-196.—A biographical memoir.—*E. Y. Beeman.*

5884. Vogt, Evon Z. Clyde Kay Maben Kluckhohn. In American Philosophical Society, *Year book: 1961*. Philadelphia, Pa.: APS, 1962. Pp. 133-137.—A biographical memoir.—*E. Y. Beeman.*

THEORY & SYSTEMS

5885. Beach, Lee Roy. (U. Colorado) *A mathematical theory of inference behavior.* *Dissert. Abstr.*, 1962, 22(9), 3270-3271.—*Abstract.*

5886. Berger, Emanuel M. (U. Minnesota) *Zen Buddhism, general psychology, and counseling psychology.* *J. counsel. Psychol.*, 1962, 9(2), 122-127.—A theoretical article describing Zen concepts and their relationship to psychology.—*E. R. Oetting.*

5887. Boaz, G. D. (Madras, India) *The concept of mind.* *Indian J. Psychol.*, 1962, 37(2), 53-66.—In his Presidential Address for the Section of Psychology and Educational Science, 49th Indian Science Congress, 1962, Boaz decries the tendencies of modern psychology to determine subject matter by methodology rather than the opposite, and to oversimplify by “electronic brains” and neurophysiology. He points to certain persistent problems (such as the extreme adaptability and spontaneity of the nervous system, consciousness, and parapsychology) which are not adequately represented by mechanical models. All students of psychology should confront them-

selves with the mind as an entity and as a legitimate problem for study.—*J. T. Cowles.*

5888. Bolton, T. H. *The structure of the mind.* Part II. *Brit. J. statist. Psychol.*, 1961, 14(2), 144.—The author questions Cyril Burt's use of the concept “mind,” seeing in this use the old problems of philosophical dualism. Bolton points out that Burt has not explained precisely what he understands by the word “mind,” and Bolton asks Burt to give specific instances of individual differences that cannot be completely described in behavioristic terms.—*H. P. Kelley.*

5889. Burt, Cyril. (University Coll. London, England) *The structure of the mind: A reply.* *Brit. J. statist. Psychol.*, 1961, 14(2), 145-170.—“The primary object of this paper is to plead for a reintroduction into psychology of the concept of mind.” Burt responds to certain of his critics—among them Smythies [see 37: 5898], Hudson [see 37: 5890], and Bolton [see 37: 5888]—by discussing differences in methodology. Next Burt reviews current views of “mind” and consciousness and discusses instrumental theories. By way of a summary and conclusion he outlines his own conception of a “mind.”—*H. P. Kelley.*

5890. Hudson, K. S. *The structure of the mind: Part II.* *Brit. J. statist. Psychol.*, 1961, 14(2), 143-144.—The author argues for a purely objective psychology and against Cyril Burt's attempt to reintroduce the concept of “mind” into psychology.—*H. P. Kelley.*

5891. Luce, Duncan R. Comments on Rozeboom's criticism of “On the Possible Psychophysical Laws.” *Psychol. Rev.*, 1962, 69(6), 548-551.—(see 36: 1BB81L) Psychological laws will in general involve dimensional parameters. It is necessary to state carefully the transformational aspects of the law.—*C. T. Morgan.*

5892. Pinkava, V. (Psychiatrická klinika, Prague, Czechoslovakia) *Model stupňovité preference s psychopatologickou aplikací.* [Model of graduated preference with its psychological application.] *Ceskoslov. Psychol.*, 1962, 6, 178-184.—A method of theory formation of pathological disturbances is outlined. (Russian & English summaries)—*V. Břicháček.*

5893. Prentice, W. C. H. (Swarthmore Coll.) *The self as person.* *Ann. N. Y. Acad. Sci.*, 1962, 96(3), 785-796.—The word “self” has referents whose referents themselves have multiple referents. The self is more than any set of experiences or memories. Person is defined in terms of relational abstractions permitting prediction of choice behavior. The way in which one views oneself as a person in contrast to the way in which others may, provides empirical grounding for the self. Ego-involvement means taking one's own interests into account in an activity. One need not, however, necessarily have a better idea of one's own interests than others do. A number of questions posed by this concept are raised.—*B. S. Aaronson.*

5894. Rozeboom, William W. *The untenability of Luce's principle.* *Psychol. Rev.*, 1962, 69(6), 542-547.—A criticism of Luce's (see 36: 1BB81L) postulates concerning (a) consistency of substantive and measurement theories and (b) invariance of the substantive theory.—*C. T. Morgan.*

5895. Sarkisov, S. A. (Acad. Medical Sciences, Moscow, USSR) *Estestvonauchnye i filosofskie voprosy sovremennoogo sostoiianiia nauki o mozge*. [Scientific and philosophical problems of modern science of the brain.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(6), 985-1000.—Survey of our present knowledge about the brain. The scientific findings about the structure and the function of the brain can be properly understood only in the light of Marxist-Leninist teachings.—A. Cuk.

5896. Scher, Jordan M. (Ed.) *Theories of the mind*. New York: Free Press Glencoe, 1962. xix, 748 p.—The contributions of 35 collaborators have been organized into 33 chapters designed to explore all known avenues to the study of the mind. Part I (brain) includes basic physiological, biochemical, behavioral, genetic, and neurological considerations. Part II (participation) attempts to define philosophical, psychiatric, and cybernetic aspects. Part III (method) considers a miscellany of methodologies from introspection to possibility processes.—H. P. David.

5897. Shoben, Edward J., Jr. (Columbia U.) *Behavioral aspects of the self*. *Ann. N. Y. Acad. Sci.*, 1962, 96(3), 765-773.—The development of scientific psychology led to an abandonment of the study of the self. A comparison of psychological and psychoanalytical concepts is advanced in terms of the concept of guilt and the defense mechanisms. Understanding the self is important with respect to understanding the relation between conscious and unconscious and in understanding identity and self-evaluation. Self-potency is an important dimension in mental health. Selective responsiveness is an important defining factor of the self. (20 ref.)—B. S. Aaronson.

5898. Smythies, J. R. (U. Edinburgh) *The structure of the mind: Part I. A note on physical and psychological space*. *Brit. J. statist. Psychol.*, 1961, 14(2), 141-142.—Smythies replies to a number of objections by Cyril Burt to Smythies' formulations of the representative theory of perception and of the nature of the mind-brain relationship, as previously reported in his book, *Analysis of Perception* (see 31: 4150).—H. P. Kelley.

5899. Traxel, W. *Grundzüge eines Systems der Motivierungen*. [Characteristics of a system of motivation.] *Arch. ges. Psychol.*, 1962, 114(2), 143-172.—Emotional reactions of 20 male graduate students to 12 selected color slides were recorded in a plane scalar system whose coordinates are points on scales for pleasantness-unpleasantness and submission-dominance. A 3rd "dimension," degree of "activation," which the author equates with libidinal strength is under investigation. Vectorial relationships among the scalar quantities can provide insights on relationships between emotions. Implications for psychoanalysis and a system of topological psychology are discussed.—K. J. Hartman.

PHILOSOPHY

5900. Basszin, F. V. *A neofreudizmus kritikája*. [Criticism of neofreudism.] *Magyar pszichol. Szle.*, 1961, 18(1), 3-25.—After dealing with the historical development of the Freudian and neo-Freudian schools of thought the author emphasizes that certain scientific concepts have to be evaluated not only on

the basis of their validity but also on their influence on the development of our culture and society. Psychoanalysis is based on idealistic philosophies and its influence is of a reactionary nature. The ideological influences of freudian thinking supported tendencies hostile to social and scientific progress. To explain the reactions of workers in analytical terms helps to shift the emphasis from the class struggle to a broader application of psychoanalytical treatment as the method to better the worker's lot. A strong stand is taken against neofreudian "compromises." "For a dialectic materialistic neurologist and psychologist cannot compromise theories based on dialectic materialistic philosophy with freudian theories which are based on subjective idealism. . . . We have to fight against freudism whichever ideological form it takes in order to uncover consistently and completely its thorough pseudoscientific and politically reactionary character."—E. Friedman.

5901. Clark, Walter H. (Hartford Seminary Found., Conn.) *A religious approach to the concept of the self*. *Ann. N. Y. Acad. Sci.*, 1962, 96(3), 831-842.—The psychology of religion has been sadly lacking. Methodology is limited to study of personal documents and the individual case. The anthropological method of "the participant observer" is applicable to studying religious experience. Many religious selves may be delineated. James' concepts of the once-born and the twice-born are cited as examples. Mystics are likely to be twice-born and are the prime examples of the religious self. Mystic experience involves a total transmutation of personality. 7 characteristics of mystic experience are noted. Its potential is present in all men. (21 ref.)—B. S. Aaronson.

5902. Gomes de Araujo, H. de A. (Porto, Portugal) *El hombre en el diálogo con su mundo: Apuntes de psicología fenomenológica*. [Man in dialogue with his world: Notes from phenomenological psychology.] *Rev. Psicol. gen. apl.*, 1961, 16 (Whole No. 58), 259-272.—A philosophical essay emphasizes that the fundamental psychological situation is existence in a world confronted by problems.—E. B. Page.

5903. Havens, Joseph. (Carleton Coll.) *The participant's vs. the observer's frame of reference in the psychological study of religion*. *J. scient. Stud. relig.*, 1961, 1(1), 79-87.—The phenomenological method as a source of data concerning religious experience and behavior is important. The tension existing between the phenomenological approach and the objective observer's approach is fruitful. Although the phenomenological approach relies more heavily on knowledge-by-acquaintance than do other methods of data gathering, it should still be seen on part of the scientific enterprise. "Science is only one of several ways of approaching religion, and is clearly to be distinguished from the 'unitive knowing' of the religious participant."—O. Strunk, Jr.

5904. Kunz, Hans. *Die eine Welt und die Weisen des In-der-Welt Seins: I. Fortsetzung*. [The one world and the modes of being in the world: I. Continuation.] *Psyche, Stuttgart*, 1962, 16(7), 464-480.—Dilthey, like Helmholtz, sought to derive our awareness of independent reality from the resistance it offers to our willing. But Heidegger has shown that experiencing of resistance can only occur

in an already constituted world within which we find ourselves. Our doubts about the reality of the "outer world" are rooted in our capacity for losing the world, and are eventually linked to the death inherent in the source of thought itself. It is this virtual world loss that presses us to "establish" and "ensure" our being in the world.—*E. W. Eng.*

5905. Mettler, Fred A. (Columbia U.) **Structural basis of the self.** *Ann. N. Y. Acad. Sci.*, 1962, 96(3), 687-724.—Beginning with concepts of non-identity between neurologic self and Cartesian soul, and of the self as a dynamic process in space-time extending beyond the physical body, functions and aspects of the self are delineated. These are in turn related to nervous system functions related to anatomical sites. Criteria for breakdown in self-concepts and percepts are discussed and related to these sites and functions and are reviewed for clues to what is self. Breakdown is evaluated as it occurs in many psychiatric and neurological conditions. It is noted that while there is congruence between self and neural function, the correlation is not perfect. (117 ref.)—*B. S. Aaronson.*

5906. Misiak, Henryk. (Fordham U.) **The philosophical roots of scientific psychology.** New York: Fordham Univer. Press, 1961. xiv, 142 p. \$3.00.—Discoveries in modern psychology have long been known to owe a great debt to the schools of philosophy from which the problems arose and out of which solutions have come. An intelligent understanding of these philosophical roots has been lacking in too many students of psychology. The author attempts to fill this gap by showing the fundamental relations between schools of philosophy and the growth of scientific psychology. Includes topical bibliography.—*R. M. Frumkin.*

5907. Rothschild, F. S. (Hadassah University Hosp., Jerusalem, Israel) **Laws of symbolic mediation in the dynamics of self and personality.** *Ann. N. Y. Acad. Sci.*, 1962, 96(3), 774-784.—The development of self is viewed as an evolution of subjectivity which is best shown in the symbol which unites the objective and subjective aspects of reality. The semiotic approach to meaning is contrasted to the cybernetic. Organisms are compared with linguistic forms. Meaning and meaninglessness are equated with life and death. Internal polarization of organisms is necessary in order for them to communicate with the world around them. Each new system for accomplishing this dominates all preceding systems. These conceptions are traced phylogenetically, developmentally, phenomenologically. (16 ref.)—*B. S. Aaronson.*

5908. Runes, Dagobert D. (Ed.) **Classics in logic: Readings in epistemology, theory of knowledge and dialectics.** New York: Philosophical Library, 1962. xiv, 818 p. \$10.00.—An alphabetical collection of extracts from writers ranging from Parmenides ("The Two Ways of Search") to Carnap ("Elementary and Abstract Terms"). Selections range from about 3 to 25 pages and are preceded with brief biographical sketches and listings of "main works."—*R. A. Littman.*

5909. Wenkart, Antonia. (New York Ontoanalytic Ass., NYC) **The self in existentialism.** *Ann. N. Y. Acad. Sci.*, 1962, 96(3), 814-822.—The self

moves from sensory perception to conceptual ideation. It represents the actor in the struggle between existence and nothingness. The self transcends self-awareness and requires others for self-knowledge. The important decision for man is to accept his self. To the extent that he is able to accept his self, he is free. Time and space are merely attributes of the self experiencing itself. Man cannot be captured by any set of formulations. In its growth, the self is actualizing. Some additional attributes of the self are set forth.—*B. S. Aaronson.*

STATISTICS

5910. Auwood, Joseph A. **Methods of computing simple statistics by means of the Type 026 cardpunch and Type 082 card sorter.** *USN Med. Res. Lab. Rep.*, 1961, 20(3, Whole No. 349), iii, 8 p.—A method of computing simple statistics has been devised utilizing the IBM 026 cardpunch and the 082 card sorter, 2 machines which are basic to any IBM installation. Step-by-step procedures are presented, with examples, for obtaining frequency distribution and such simple descriptive statistics as the mean, standard deviation, median, 2×2 contingency tables, and other similar statistics using the card punch and the card sorter in conjunction with a desk calculator. The limitations of these techniques are also discussed.—*USN MRL.*

5911. Borko, H. (Ed.) **Computer applications in the behavioral sciences.** Englewood Cliffs, N. J.: Prentice-Hall, 1962. 633 p. \$11.65.—In the 1st 2 parts the editor introduces the history, principles, and applications of electronic data processing. Part III describes a variety of computer applications: statistical computations (multiple linear regression, factor analysis, and canonical analysis), computer applications in experimental psychology (studies of perception, automated teaching, problem solving behavior, human language behavior, machine translation of language, and computer generated musical compositions), system simulation studies (artificial neural net theory, medical diagnosis, behavior of large social groups, operation of a business firm, and international relations). The final chapter, also by the editor, forecasts the future of computers in behavioral science research. Each chapter includes a selected bibliography. There are many illustrations and a glossary of computer terms.—*K. J. Hartman.*

5912. Bradley, R. A., Katti, S. K., & Coons, Irma J. (Florida State U.) **Optimal scaling for ordered categories.** *Psychometrika*, 1962, 27(4), 355-374.—This paper deals with the determination of optimal weights for points on scoring scales for subjective comparative experiments. A scoring scale with a specific number of points is considered, and it is assumed that verbal or other indications imply an order to the scale points. The optimal spacing for the scale points is obtained in the sense that treatment or item differences are maximized relative to error or within-treatment variation. The method is presented in sufficiently generalized form to be used directly with any experimental design leading to the analysis of variance. An iterative procedure, suitable for computer use, yields the optimal differences among the ordered scale points. Properties of this procedure are discussed.—*Journal abstract.*

5913. Gorow, Frank F. (Long Beach State Coll.) **Statistical measures: A programmed text.** San Francisco, Calif.: Chandler, 1962. viii, 178 p. \$2.25.—This is a programmed text for study of central tendency, dispersion and correlation. It consists of branching programs for learning to compute the statistics. The student reads the instructions and follows the steps. Depending upon the student's answer to Step 1, he is sent to another step which either confirms his answer if correct, or informs him of his error, guides him in correcting it and then sends him to another step. The use of this scrambled and programmed material is said to permit a reduction of about $\frac{1}{2}$ in the class time assigned to the statistical unit usually given to prospective secondary-school teachers.—R. E. Perl.

5914. Matalon, B. **Une généralisation multidimensionnelle de l'analyse hiérarchique.** [A multidimensional generalization of the scale analysis.] *Bull. Cent. Etud. Rech. Psychotech.*, 1962, 11(1), 45-57.—"When the analysis of responses to a set of items shows . . . [that they] do not shape into a Guttman scale, it may be possible to interpret the results by generalizing scale analysis. . . . The technique suggested consists in finding the 'generators' of the observed set of patterns, i.e. patterns which do not result from the composition of two other observed patterns. Knowing these generators is sufficient to reconstitute observed patterns and to evidence a partial order or several complete orders in the items. In some cases it is possible to represent each item by a point in a multidimensional space and to interpret these dimensions as 'factors' in Coombs and Kao's nonmetrical factor analysis."—V. Sanua.

5915. Nunnally, Jum. (Vanderbilt U.) **The analysis of profile data.** *Psychol. Bull.*, 1962, 59(4), 311-319.—"Methods were suggested for handling 3 problems in the analysis of test profiles: measuring the similarity of profiles, discriminating the typical profiles of two or more groups, and clustering profiles into homogeneous groups. The suggested methods were, respectively, picturing profiles as interpoint distances in Euclidean space, use of the linear multiple-discriminant function, and factor analysis of profile cross-product terms. Some suggestions were given about transformations of profile data before further analysis."—W. J. Meyer.

5916. Rosenthal, Robert, & Gaito, John. (U. North Dakota) **The interpretation of levels of significance by psychological researchers.** *J. Psychol.*, 1963, 55(1), 33-38.—19 Ss (faculty and graduate students) were asked to indicate degree of belief in research results at different p values, once with an n of 10 and then with n equal to 100. Ss had greater confidence in the p levels when they were associated with the larger sample size. Graduate students tended to place more confidence in the p levels than did faculty Ss. Most of the Ss showed a more precipitous loss of confidence in moving from .05 to .10 than at any other levels of significance.—Author abstract.

Experimental Design

5917. Orne, Martin T. (Harvard Medical School) **On the social psychology of the psychological experiment: With particular reference to demand characteristics and their implications.** *Amer. Psychologist*, 1962, 17(10), 776-783.—Taking part in an

experiment is "a special form of social interaction." The S plays a role and places himself under the control of the E; he may agree "to tolerate a considerable degree of discomfort, boredom, or actual pain, if required to do so." The very high degree of control inherent in the experimental situation itself may lead to difficulties in experimental design. The S "must be recognized as an active participant in any experiment." With understanding of factors intrinsic to experimental context, experimental method in psychology may become a more effective tool in predicting behavior in nonexperimental contexts.—S. J. Lachman.

5918. Ryan, Thomas A. (Cornell U.) **The experiment as the unit for computing rates of error.** *Psychol. Bull.*, 1962, 59(4), 301-305.—In reply to Wilson (see 37: 5919), arguments are presented for controlling error rates per experiment rather than per hypothesis. The major contention is that a per hypothesis strategy permits wide variation in the total amount of error expected for different experimental designs involving the same total number of observations.—W. J. Meyer.

5919. Wilson, Warner. (U. Hawaii) **A note on the inconsistency inherent in the necessity to perform multiple comparisons.** *Psychol. Bull.*, 1962, 59(4), 296-300.—The comparison of multiple groups raises the question of the appropriate unit in which to evaluate the research. Thus it would be possible to hold errors constant per comparison, per hypothesis, per experiment, per group, or even per S. ". . . the most defensible decision is to divide our work into separate tests of hypotheses and to hold constant the expected number of errors per hypothesis tested."—W. J. Meyer.

Formulas & Calculations

5920. Boneau, C. Allan. **A comparison of the power of the U and t tests.** *Psychol. Rev.*, 1962, 69(3), 246-256.—"The present paper is intended to present the facts (culled from the literature as well as manufactured for the purpose) about the power of the t test and, in particular, how that power compares with the power of a specific nonparametric competitor in various practical situations."—C. T. Morgan.

5921. Chapanis, Alphonse. (Johns Hopkins U.) **An exact multinomial one-sample test of significance.** *Psychol. Bull.*, 1962, 59(4), 306-310.—The exact multinomial test described in this article can be used to test the significance of variations in the numbers of observations distributed into 2 or more mutually-exclusive categories. When there are only 2 categories the test reduces to the binomial test. The test is valid for samples of any size but it quickly becomes prohibitively difficult to apply as the total number of categories increases. A comparison with the chi-square test shows how seriously the latter may be in error when the number of observations is small.—W. J. Meyer.

5922. Cliff, Norman. (Educational Testing Service) **A note on the adjustment of fourfold tables for "curvilinearity."** *Educ. psychol. Measmt.*, 1962, 22(4), 721-724.—A correlation for "curvilinearity" suggested by Holley for use with dichotomous variables is shown to yield inaccurate results.—W. Coleman.

5923. Cronbach, Jee J., & Azuma, Hiroshi. (U. Illinois) Internal-consistency reliability formulas applied to randomly sampled single-factor tests: An empirical comparison. *Educ. psychol. Measmt.*, 1962, 22(4), 645-665.—"Hypothetical randomly parallel tests were constructed by sampling at random from a pool of dichotomous items with uniform tetrachoric correlations and a rectangular distribution of difficulties. Various reliability formulas were evaluated for each test." 7 formulas were employed including the product moment r_1 coefficient of generalizability; generalized Kuder-Richardson Formula 20; intraclass r for stratified-parallel forms; intraclass r for item-parallel tests; Horst's "corrected" α ; and Kuder-Richardson Formula 21, large sample version. The generalized K-R 20 proved to be highly satisfactory for estimating the score. This applies "when a test is a random sample from a pool of dichotomous items whose content represents a single factor, and whose mean intercorrelations are within the normal range."—W. Coleman.

5924. Cser, János. Pszichologia vizsgálatok gyors feldolgozása egyszerű szerkesztő eljárással. [Quick elaboration of psychological tests by means of simple designing procedure.] *Magyar Pszichol. Szle.*, 1961, 18(1), 45-52.—"The author outlines the elaboration of psychological tests with percentilgraph, pointing out the advantages of this method: explicitness, clearness, exemption from arbitrary computation and lengthy calculation. The performances are arranged in progression and divided into ten equal subgroups; their mean values are marked on the ordinates 5, 15, 25, 35, etc. of the axis of 100 mm. division. The connection of these points gives the percentilgram with approximate accuracy; the mean value as well as quarter digressions can be read directly, without computation."—E. Friedman.

5925. Cureton, Edward E. (U. Tennessee) A note on simultaneous equations and matrix inversion. *Brit. J. statist. Psychol.*, 1962, 15(1), 51-58.—"The note discusses the special advantages of the 'hierarchical method' of solving linear equations, and describes and illustrates in detail the working procedure recommended for calculating inverses in the case of both symmetric and nonsymmetric matrices."—N. Earle.

5926. Gold, R. Z. On comparing multinomial probabilities. *USAF SAM Rep.*, No. 62-81. 1962, 13 p.—The author presents 2 methods for constructing simultaneous confidence intervals for linear functions of the unknown probabilities in independent sequences of multinomial trials. One method permits an infinite number of intervals while the other requires that their number be finite and that the particular linear functions be specified in advance.—M. C. Payne, Jr.

5927. Howard, Kenneth I., & Forehand, Garlie A. (U. Chicago) A method for correcting item-total correlations for the effect of relevant item inclusion. *Educ. psychol. Measmt.*, 1962, 22(4), 731-735.—Equations are derived for computing item-total score r 's when the relevant item is included. Data from the application of 1 formula was compared with r 's obtained with the relevant item excluded. The discrepancies in r were slight with 81% below .025; only 6 discrepancies exceeded .055.—W. Coleman.

5928. Sandon, Frank. (Birmingham Education Committee) The means of sections from a normal distribution. *Brit. J. statist. Psychol.*, 1961, 14(2), 117-121.—Included is a "table for the mean abscissae of vertical sections of the normal curve. The need and usefulness of such a table are illustrated by problems from the field of mental measurement."—H. P. Kelley.

5929. Sandon, Frank. An alternative table for determining means of sections from a normal distribution. *Brit. J. statist. Psychol.*, 1962, 15(1), 71-74.—A table is given "for determining means of vertical sections of the normal curve when the data given consist of the proportions of the total population falling above and below the limits of the sections."—N. Earle.

5930. Sixtl, Friedrich. (U. Hamburg, Von-Melle-Park 15, Germany) Ein Vergleich der Prozent-Quotient-Methode von Clostermann mit anderen Vier-Felder-Korrelationsmassen. [A comparison of Clostermann's percent-quotient method with other estimates of fourfold correlation.] *Z. exp. angew. Psychol.*, 1962, 9(3), 465-473.—It is shown that Clostermann's quotient overestimates the correlation parameter within the relevant range of .5 to .8. Mosteller's estimate of ρ seems still the best method.—W. J. Koppitz.

Factor Analysis

5931. Burroughs, G. E. R. Rotation of axes and psychological space. *Brit. J. statist. Psychol.*, 1962, 15(1), 75.—The author of this note takes issue with certain statements and implications made by Jarrett (see 37: 5938) concerning the appropriateness of the use of certain types of measurement units in factor analysis studies.—N. Earle.

5932. Cattell, Raymond B. (U. Illinois) The basis of recognition and interpretation of factors. *Educ. psychol. Measmt.*, 1962, 22(4), 667-697.—Identification and interpretation of a factor occur after a unique rotational resolution. Alternative ways of expressing a factor "affect both the resolution adopted and the ensuing matching and interpretation decisions." To obtain the best decisions 6 sources of information should be considered: (a) the nature of the dimension-variable (DV) relation profiles; (b) the correlations of entity with other known, landmark factors; (c) its size or "importance" (mean total variance contribution in a defined domain of variables); (d) identification by elimination, i.e., considering other possible matches in matrices planned to give a complete series; (e) study of modifications producible in the 1st 3 by experimental conditions, samples, and designs; e.g., comparing R- and P-techniques; and (f) the behavior of the total factor in manipulative and survey experiments. An example is given based on an N of 500 with 3 source traits involved.—W. Coleman.

5933. Cattell, Raymond B., & Dickman, Kern. (U. Illinois) A dynamic model of physical influences demonstrating the necessity of oblique simple structure. *Psychol. Bull.*, 1962, 59(4), 389-400.—The concepts generated by factor analysis were tested on a known physical model. 32 properties (behaviors) were measured for 80 balls, varying in size, weight, elasticity, and length of string on which some of their "performances" were measured. The

variables were inter-correlated and factor analyzed. As expected from theoretical considerations, 4 factors were extracted; simple structure was attained by oblique rotation but not orthogonal rotation; factor interpretation was most clear for the oblique solution. Implications of the results are discussed.—*W. J. Meyer.*

5934. DeGough, Roy Allen. (Ohio State U.) **Factor space versus common factor space and a technique for extracting all the factors.** *Dissert. Abstr.*, 1962, 22(10), 3733-3734.—*Abstract.*

5935. Gibson, W. A. (Dept. Defense, United States) **An asymmetric approach to multiple-factor analysis.** *Brit. J. statist. Psychol.*, 1961, 14(2), 97-107.—"After a brief history of asymmetric approaches in factor analysis and related fields, there is derived a new asymmetric procedure that avoids communality estimation and other difficulties. This new solution splits a test battery 1 into sub-batteries x and y , each of which spans the same factor as does a test battery 2. This permits finding the unknown transformation that converts any factorization of the between-battery correlations R_{12} into an orthogonal factor matrix reproducing both R_{12} and R_{xx} , the between-sub-battery correlations."—*H. P. Kelley.*

5936. Hampejšová, O. (Charles U., Prague, Czechoslovakia) **Faktorová analýza: Matematická formulace problému a vývoj metod.** [Factor analysis: Mathematical formulation of the problem and the development of methods.] *Ceskoslov. Psychol.*, 1962, 6, 64-78.—Pure mathematical solutions are not generally acceptable to psychology because it is usually impossible to interpret the factors. The rotation problem is discussed along with the efforts to replace subjectivity by truly objective methods. A complete mathematical formulation of factor analysis is needed. (Russian & English summaries)—*V. Břicháček.*

5937. Henrysson, Sten. (U. Stockholm, Sweden) **The relation between factor loadings and biserial correlations in item analysis.** *Psychometrika*, 27(4), 419-424.—The 1st centroid factor loadings obtained from various interitem relations are compared with item discrimination indices commonly used in item analysis. Depending upon what type of matrix is factored, the factor loadings are shown to be related to point biserial and biserial correlations.—*Journal abstract.*

5938. Jarrett, R. F. (U. California) **A note on rotation and psychological space.** *Brit. J. statist. Psychol.*, 1961, 14(2), 109-115.—"The purpose of this note is three fold: to consider the conditions under which the concept of distance (both physical and psychological) and angle (the pure number function of distance) are meaningful; to suggest that there is some evidence that these conditions do not obtain throughout psychological space; and to consider briefly the implications of this evidence." The argument is that distance (and therefore angle) is meaningful only when the space involved possesses the property of dimensional isotropy; isotropic space is defined as one in which measurement operations can be identical regardless of the direction one wishes to measure.—*H. P. Kelley.*

5939. Jöreskog, K. G. (U. Uppsala, Sweden) **On the statistical treatment of residuals in factor analysis.** *Psychometrika*, 1962, 27(4), 335-354.—

A method for estimating in factor analysis is presented. The method is based on the assumption that the residual (specific and error) variances are proportional to the reciprocal values of the diagonal elements of the inverted covariance (correlation) matrix. The estimation is performed by a modification of Whittle's least squares technique. The method is independent of the unit of scoring in the tests. Applications are given in the form of 9 re-analyses of data of various kinds found in earlier literature. (37 ref.)—*Journal abstract.*

5940. McDonald, Roderick P. (U. New England, Australia) **A general approach to nonlinear factor analysis.** *Psychometrika*, 27(4), 397-415.—The method presented attempts to allow for nonlinear, possibly nonmonotonic relations between manifest and latent variates. An attempt is made to provide a workable criterion for choosing between alternative models on the basis of observable data as well as for constructing the appropriate function. An idealized numerical example is given. (15 ref.)—*Journal abstract.*

5941. Paterson, C. R. **The three dimensions of factor analysis: Part I** *Brit. J. statist. Psychol.*, 1962, 15(1), 93.—Questions are asked of Williams and Burt concerning the necessity for considering conclusions drawn from correlating tests, conclusions drawn from correlating persons, and conclusions drawn from correlating values.—*N. Earl.*

5942. Rawson, Harve E., & Rettig, Salomon. (Ohio State U.) **Factor analysis as a controlling technique.** *Educ. psychol. Measmt.*, 1962, 22(4), 725-729.—Factor analysis was used in 2 very different studies for controlling and isolating extraneous and/or contaminating factors. Variables unrelated to the major hypotheses were isolated and their contaminating effects partialled out from the hypothesized criteria-predictor dimension.—*W. Coleman.*

5943. Williams, E. D., & Burt, C. **The three dimensions of factor analysis: II. A reply.** *Brit. J. statist. Psychol.*, 1962, 15(1), 93-94.—Replies are given to the questions raised by Paterson (see 37: 5941) regarding the need for using 3 types of variables in investigating problems of individual differences and their apparent causes in the studies by Williams and Burt.—*N. Earl.*

GENERAL BOOKS & REFERENCE WORKS

5944. Delgado, Honorio, & Ibérico, Mariano. **Psicología: Estudio metodológico del mundo animico.** (7th ed.) [Psychology: Methodological study of the mental world.] Barcelona, Spain: Editorial Científica-Médica, 1961. 311 p.—A survey of the more philosophical concepts in psychology (character, instinct, imagination, self-concept, etc.) from a holistic point of view, presented in 31 essays.—*E. B. Page.*

5945. Duker, Sam. **Master's theses on listening.** *J. Commun.*, 1962, 12(4), 234-242.—Incomplete bibliography of 107 items on listening. References are classified under various headings.—*D. E. Meister.*

5946. Frazer, James George. **The new "Golden Bough."** Garden City, N. Y.: Doubleday, 1961. xx, 426 p. \$195(paper).—A paperback edition of the 1959 abridged edition published by Criterion books.—*E. Y. Borrowman.*

5947. Geldard, F. A. (U. Virginia) **Fundamentals of psychology**. New York: Wiley, 1962. 437 p.—An updated version of Boring, Langfeld, and Weld's *Foundations of Psychology* (see 22: 4186). Without straying into the speculative branches of contemporary psychology, the 22 chapters provide "(1) . . . [some] basic conceptions about science and psychology's place in it; (2) an introduction . . . of the three master rubrics of psychology—motivation, learning, and perception; (3) a return to each of these topics at a 'higher' or 'derived' level; (4) the integration of all three in the specialized and applied areas of psychology; (5) a final look at the frontiers of psychological science." The text assumes an instructor who is knowledgeable in psychology. (286 ref., 2450-item index, Student Workbook, Instructor's Manual)—R. S. Harper.

5948. Harms, Ernest. (Ed.) (Grand Central Hosp., NYC) **Fundamentals of psychology: The psychology of the self**. *Ann. N. Y. Acad. Sci.*, 1962, 96 (3), 681-894.—Proceedings of a conference on self-psychology. (See 37: 5893, 5897, 5901, 5905, 5907, 5909, 6462, 6679, 6769, 6794, 7063, 7065)—B. S. Aaronson.

5949. Sartain, Aaron Quinn; North, Alvin John; Strange, Jack Roy, & Chapman, Harold Martin. **Instructor's manual to accompany "Psychology: Understanding Human Behavior."** New York: McGraw-Hill, 1962. iv, 99 p.—(See 37: 4057).

5950. Wells, Harry Kohlsaatt. Ivan P. Pavlov: **Toward a scientific psychology and psychiatry**. New York: International, 1962. 224 p. \$1.45 (paper).—A paperback edition of the book originally published in 1956.

ORGANIZATIONS

5951. American Psychological Association. Officers, boards, committees, and representatives of the American Psychological Association: 1962-63. *Amer. Psychologist*, 1962, 17(12), 865-887.—S. J. Lachman.

5952. American Psychological Association, Council of Editors. **Summary report of journal operations: Calendar 1961**. *Amer. Psychologist*, 1962, 17(12), 923.—A table indicating manuscripts (number received, number accepted, percentage rejected), printed pages (articles published, total pages published, average lag), and subscriptions (member and nonmember) for the 12 journal publications of the American Psychological Association is presented.—S. J. Lachman.

5953. Crawford, Meredith P. (American Psychological Ass.) **Report of the Treasurer**. *Amer. Psychologist*, 1962, 17(12), 860-864.—S. J. Lachman.

5954. Darley, John G. (American Psychological Ass.) **Report of the Executive Officer: 1962**. *Amer. Psychologist*, 1962, 17(12), 839-842.—Major responsibilities of the Executive Officer are considered. "This year, concern has been forcibly expressed regarding the impact and side effects of our program of accreditation on our academic training centers." There is also concern evidenced regarding the private practice of psychology, the role of psychologist under major health and medical policies, and activities at the state level toward licensing and legislative enactments.

The science, professional affairs, state societies, and national organizations continue to grow effectively.—S. J. Lachman.

5955. Newman, Edwin B. (Harvard U.) **Proceedings of the seventieth Annual Business Meeting of the American Psychological Association, Incorporated: August 31 and September 4, 1962, St. Louis, Missouri. Report of the Recording Secretary**. *Amer. Psychologist*, 1962, 17(1), 843-859.—S. J. Lachman.

PROFESSIONAL PROBLEMS

5956. American Board of Examiners in Professional Psychology. **1962 annual report**. *Amer. Psychologist*, 1962, 17(12), 924-926.—Since its incorporation in 1947, "2,568 candidates have applied for the Diploma of ABEPP." 1557 applications were received and 1116 awards were made under a "grandfather" provision; 1011 other candidates have been received under the mandatory examination provision. Of 852 candidates who have taken the written examination, 706 (83%) passed on the 1st attempt, 66 passed on a 2nd examination, and 33 are awaiting re-examination. Of those passing written examination, 757 have taken the oral examination and 749 of these have been evaluated: 449 (60%) passed on the 1st attempt, 149 qualified on the 2nd examination. Under the provision of mandatory examination diplomas have been granted to 521 in clinical, 37 in counseling, and 40 in industrial to date.—S. J. Lachman.

5957. Moreno, J. L. (Moreno Inst., Beacon, N. Y.) **Le concept du rôle: Lien entre la psychiatrie et la sociologie**. [The concept of rôle: Bond between psychiatry and sociology.] *Evolut. psychiat.*, 1962, 27(3), 327-337.—"The rôle concept originated in the European tradition of the theater. A comprehensive scientific and therapeutic concept of rôle behavior has been developed in the last four decades largely by psychodramatic theorists. . . . Psychiatric rôle theory developed out of carefully prepared experiments and clinical contexts, methods of prevention, treatment of psychoses and neuroses, of marriage and family groups, of interpersonal relations, of problems of industrial adjustment, of the fields of mental hygiene and education."—L. A. Ostlund.

5958. Shepherd, M. (Maudsley Hosp., London, England) **La place de la psychiatrie dans l'éducation médicale aux états-unis et en Angleterre**. [The place of psychiatry in medical education in the United States and England.] *Encephale*, 1962, 51(4), 345-360.—The increasing rôle of psychiatry in medical education due to the development of the concepts of "comprehensive medicine" in the United States and "social medicine" in England is described. Infiltration has been more extensive and rapid in American schools.—W. W. Meissner.

Psychological Personnel

5959. Galinsky, M. David. (U. Michigan) **Personality development and vocational choice: A study of physicists and clinical psychologists**. *Disser. Abstr.*, 1962, 22(7), 2464.—Abstract.

5960. Klein, Frederick L., McNair, Douglas M., & Lorr, Maurice. (Gallaudet Coll.) **SVIB scores of clinical psychologists, psychiatrists, and social workers**. *J. counsel. Psychol.*, 1962, 9(2), 176-179.

—5 areas and 9 scales discriminate between these professions. Ratings of competence and personal psychotherapy are essentially unrelated to scales.—E. R. Oetting.

5961. Lockman, Robert F. (American Psychological Ass.) **Characteristics of APA members in the 1962 "National Scientific Register."** *Amer. Psychologist*, 1962, 17(10), 789-792.—8650 (45%) of 19,370 National Register of Scientific and Technical Personnel questionnaires mailed to American Psychological Association members were returned within a month. Analysis of a 5% sample (432) provides the following information. New York, New Jersey, Pennsylvania, Illinois, Indiana, Michigan, Ohio, and Wisconsin produced, trained, and employed approximately $\frac{1}{2}$ of the 1962 sample. 69% had the doctorate, 28% masters, and 4% bachelor's degree. Age range of respondents was 23-90; median 38. Principal employers were colleges, 39%, and governmental organizations, 28%. Primary full time work activities were clinical and counseling practice 28%, teaching and research 21%, management and administrative tasks, 14%. Median income for full-time employed psychologists was nearly \$11,000.—S. J. Lachman.

Training in Psychology

5962. Caro, Paul Wiley, Jr. (U. Tennessee) **The effect of class attendance and "time structured" content on achievement in general psychology.** *Dissert. Abstr.*, 1962, 22(9), 3260-3261.—Abstract.

5963. McGuigan, F. J., & Ross, Sherman. (Hollins Coll.) **Psychology and the United States science exhibit: Seattle World's Fair, 1962.** *Amer. Psychologist*, 1962, 17(10), 798-800.—"The increasing interest in psychology as a science of behavior is being recognized at the Century 21 Exposition in Seattle, April 21 to October 21, 1962. An entire section on psychology has been included." The 6 exhibits relating to psychology involve: (a) conditioned reactions in salmon, (b) imprinting in chicks, (c) surrogate mothering in monkeys, (d) heredity and environment effects in mice, (e) visual discrimination in pigeons, (f) the value of teaching machines. "The educational effect on the public should be a meaningful one."—S. J. Lachman.

5964. Moss, C. Scott; Riegel, Lyman M., & Schaeffer, Robert W. (National Inst. Mental Health, San Francisco) **Objective assessment of the psychology internship experience.** *J. counsel. Psychol.*, 1962, 9(2), 158-163.—A discussion of the use of a supervisor's rating guide, a trainee's rating guide, and a semantic differential given periodically during internship. Ratings showed significant and meaningful relationships useful in training.—E. R. Oetting.

5965. Ross, Sherman. (American Psychological Ass.) **Educational facilities and financial assistance for graduate students in psychology: 1963-64.** *Amer. Psychologist*, 1962, 17(12), 901-922.—Requirements for admission, institutional facilities and stipends, advice to applicants for financial assistance, and postdoctoral arrangements are discussed. Digests of information on graduate training in psychology relevant to prospective students are presented for 189 colleges and universities.—S. J. Lachman.

5966. Roth, Robert Howard. (Newark State Coll.) **A survey of social psychology courses in teacher training institutions.** *J. Psychol.*, 1963, 55(1), 169-173.—This is the 2nd of a series of studies of the teaching of social psychology courses in American institutions of higher learning. Results of a mailed questionnaire survey of social psychology courses in teacher training institutions are presented and discussed. Inferences are drawn from the data regarding the possible lack of sufficient practice in the classroom of what is expounded in the subject matter of the course.—Author abstract.

PSYCHOLOGY ABROAD

5967. ———. **Ma matsanu be-150 hovrot "Urim."** [What we found in 150 issues of *Urim*.] *Urim*, 1961-62, 19, 527-530.—A list of psychological papers published in 19 volumes of this journal, divided into the following groups: general psychology, educational psychology, child psychology (subdivided), emotional development, physical development, psychology of deviant children, schools in psychology, diverse problems (environment, personality, thinking, learning, etc.), treatment methods, mental hygiene, psychology in teacher training colleges, and guidance.—H. Ormian.

5968. Clignet, R. **Réflexions sur les problèmes de psychologie en Afrique.** [Reflections on problems in psychology in Africa.] *BINOP*, 1962, 18(2), 86-94.—In the selection for and guidance in schooling and vocational training on the Ivory Coast, it was found that test results had to be interpreted in the light of the special conditions. Rural-urban differences and high correlation of success with socio-economic background of the parents pointed to the important part acculturation played in the children's ability to pass tests. Ethnic subgroups among the Africans also showed differences in achievement. Modes of perception, including difficulties with concepts of rectilinearity and colors, seemed directly related to the culture. Personality studies also highlight the need to relate individual character to the different cultural norms. Measuring instruments of psychologists will have to be adapted, reinterpreted, and newly standardized on this different population.—D. Mindlin.

5969. Cook, D. R. (Northeastern U.) **Problems of guidance in India.** *J. voc. educ. Guid.*, Baroda, 1962, 8(4), 1-6.—Guidance in India is largely a transplant from the United States which has not taken root. Traditions of democratic right and the emphasis on personal worth are still largely absent in India. India needs to produce a guidance literature of her own. The still prevalent caste system poses many problems for guidance workers, who must be educational leaders as well, especially in working towards expansion of the curriculum. Guidance plays a very different role in an underdeveloped country. A primary need in India is for educational guidance since so many students are floundering in ill-planned courses. The guidance movement must, of course, clearly dissociate itself from astrology and the like. Guidance in India has yet to develop an adequate self-concept.—W. L. Barnette, Jr.

5970. Rosenfeld, Jona M., & Doron, Abraham. (Hebrew U., Jerusalem, Israel) **Social welfare in Israel.** *J. Jewish communal Serv.*, 1962, 38(4), 340-

350.—A broad discussion of the basic problems involved in the establishment of a social welfare program in the new state of Israel. The needs for social security services of immigration, age, family problems, employment, education, and health are touched upon. The implications for professional workers seeking a solution to the current needs of the country are pointed out.—*M. A. Seidenfeld.*

EXPERIMENTAL PSYCHOLOGY

5971. Melton, Arthur W. (U. Michigan) Editorial. *J. exp. Psychol.*, 1962, 64(6), 553-557.—A discussion of the editorial policies and philosophy over the past 12 years of the author's editorship of the *Journal of Experimental Psychology*.—*J. Arbit.*

5972. Pavlov, I. P. *Essays in psychology and psychiatry, including a section on sleep and hypnosis*. New York: Citadel, 1962. 189 p. \$1.95 (paper).—A paperback edition of selections from I. P. Pavlov's *Experimental Psychology*, published by Philosophical Library in 1957.

5973. Welford, Norman T. (Fels Research Inst., O.) The SETAR and its uses for recording physiological and behavioral data. *IRE Trans. biomed. Electron.*, 1962, 9(3), 185-189.—"The SETAR (Serial Event Timer and Recorder) is an electronic digital elapsed-time recorder with punched paper tape output. It is a multichannel machine and will time and record the occurrence of successive events within a single channel or between different channels. An event is anything which will make or break one or more of the input circuits. The SETAR can directly record behavioral variables, such as reaction times and intertrial intervals and any physiological variables available as time measures, such as heart rate recorded from successive R-R intervals. The present machine will record in 100ths of a second and take readings up to ten times per second. Due to internal buffer storage three readings may be made at rates up to 100 per second. Events separated by less than 100th of a second are recorded as though they were simultaneous."—*C. T. Morgan.*

PSYCHOPHYSICS

5974. Abbey, David S. (Defence Research Medical Lab., Toronto, Canada) Cross-modality matching of numerosity and pitch. *Canad. J. Psychol.*, 1962, 16(4), 283-290.—Magnitude estimates of numerosity and of pitch, and cross-modal matches were made by different groups of Ss. Using only raw scores, a procedure is demonstrated for the accurate prediction of a sensation function equivalent to Steven's, from the combination of a linear and a curvilinear function.—*R. S. Davidson.*

5975. Brichcín M. (Charles U., Prague, Czechoslovakia) Nová fakta o vlivu intenzity podnětu na volní reakci. [New facts concerning the influence of the intensity of the stimulus on voluntary reaction.] *Českoslov. Psychol.*, 1962, 6(1), 1-24.—Detailed analysis of the influence of 40, 60, 80 and 100 db. tones of 1000 cycles on the latency and other parameters of the course of the forearm flexion. Latency as well as other time parameters of the course of movement are shortened; speed, acceleration, and trajectory of movement are increased under the influence

of intensified stimuli. These changes are statistically significant. Increasing the intensity of strong stimuli has greater influence than the same increase in weak stimuli. Observed changes of parameters are in closer relation to the sensory scale of loudness (in "sones"—Stevens) than to the stimuli in decibels. Man reacts to the changes of stimulus intensity as to a signal which informs him due to his experience of the meaning of these changes. Sensory intensity does not reflect only the intensity of external stimuli but also the intensity of the reactions of these stimuli. (Russian & English summaries, 52 ref.)—*V. Bricháček.*

5976. Greenberg, Gordon Z. Cueing signals and frequency uncertainty in auditory detection. *USAF ESD tech. docum. Rep.*, 1962, No. 62-38. iv, 47 p.—3 experiments were concerned "with the influence of one signal upon the detectability of a subsequent signal in an auditory detection task." In the 1st experiment, when the cueing signal was a single frequency, it was relatively ineffective as an aid to detection. In a 2nd experiment, with additional frequency uncertainty introduced, detectability increased in the presence of the cueing signal. In the 3rd experiment, designed to provide an explanation of the manner in which cueing aids detection, support was obtained for a "description of the human listener's performance, in that situation, by the 'narrow-band observer' model rather than by the 'broad-band observer' model."—*C. T. Morgan.*

5977. Hohle, Raymond Herbert. (U. Oregon) Some empirical applications and evaluations of two models for discriminability scales: Pair comparisons and successive intervals. *Dissert. Abstr.*, 1962, 22(7), 2476-2477.—*Abstract.*

5979. Short, Jerry Gene. (U. Houston) Variables of response mode and training affecting absolute judgment behavior. *Dissert. Abstr.*, 1962, 22(11), 4075-4076.—*Abstract.*

5980. Turner, Edward D., & Bevan, William. (Kansas State U.) Simultaneous induction of multiple anchor effects in the judgment of form. *J. exp. Psychol.*, 1962, 64(6), 589-592.—"The purpose of the present experiment was to determine if an anchor stimulus which differed from its psychophysical series on more than a single dimension could effect shifts in judgment on each of the dimensions on which it differed from the series. Accordingly, Ss were asked to judge a series of rectangular figures which varied in shape, size, and lightness. Anchor stimuli which represented marked deviations from the series values on two but not on the third dimension were included in the order of presentation. Three groups of Ss were used so that all combinations of two dimensions were anchored with the third available for control data. Analyses of variance performed on the data for each of the three dimensions indicated that multiple anchoring had occurred."—*J. Arbit.*

5981. Valter, V. (Slovenskej Akad. Vied, Bratislava, Czechoslovakia) Závislosť pocitu od podnetu meniacieho sa v case: I Matematicky formulovaná hypotéza. [The dependence of the sensation upon a stimulus changing in time: I. Mathematically for-

mulated hypothesis.] *Psychol. Stud.*, Bratislava, 1961, 3, 81-86.—The stimulus in the Weber-Fechner law is considered as a function of time. Presuming the existence of threshold speed one can deduce the dependence of the course of intensity of the sensation from the temporally variable stimulus. (Russian & English summaries)—*V. Břicháček*.

PERCEPTION

5982. Bonaventura, Enzo. *Il problema psicologico dello spazio*. [The psychological problem of space] Florence, Italy: Felice Le Monnier, 1961. xii, 146 p. L. 2000.—The 1st part of a work dedicated to the proposition that "Space and time are the fundamental axioms of any scientific systematization of human experience." It reviews experimental results on visual, tactual-kinetic, and auditory perception up to 1938.—*L. L'Abate*.

5983. Chatterjea, R. G., & Saha, G. B. (Calcutta, India) Influence of controlled time gap on estimation of duration. *Indian J. Psychol.*, 1962, 37 (2), 85-88.—The estimation of duration of a visual stimulus by reproduction of that interval by S after a voluntarily controlled time gap is overestimated, but to a lesser extent than when E controls the time gap before estimation.—*J. T. Cowles*.

5984. Clower, Robert Park. (U. Florida) The interdependence of velocity, distance and time as perceptual contents. *Dissert. Abstr.*, 1962, 22(9), 3272.—*Abstract*.

5985. Cohen, John. (U. Manchester, England) Tiempo subjetivo. [Subjective time.] *Rev. Psicol. gen. apl.*, Madrid, 1962, 17(61), 5-17.—The author considers the investigation over decades of the factors affecting temporal awareness and apparent temporal length, such as differential strength of 2 stimuli and related phenomena. He suggests further avenues of investigation in dreams, mental illness, and sex experience.—*E. B. Page*.

5986. Dreese, William Robert. (U. Kansas) Structural and meaningful context in tachistoscopic recognition. *Dissert. Abstr.*, 1962, 22(11), 4093.—*Abstract*.

5987. Fiss, Harry. (New York U.) State of consciousness and the subliminal effect. *Dissert. Abstr.*, 1962, 22(11), 4093-4094.—*Abstract*.

5988. Johnson, Ronald C., Thompson, Calvin W., & Frincke, Gerald. A response to Striker's comments on "Word Values, Word Frequency, and Visual Duration Thresholds." *Psychol. Rev.*, 1962, 69(3), 239-240.—(See *Psychol. Rev.*, 1962, 68(6), 420-422) Any "redefinition of word value that serves to increase the testability of certain experimental questions, generates research, and provides us with a different and . . . more correct view of reality, is . . . [not] to be rejected merely because it violates traditional usage."—*C. T. Morgan*.

5989. Taylor, James G. (U. Cape Town, South Africa) The behavioral basis of perception. New Haven, Conn.: Yale Univ. Press, 1962. xv, 379 p. \$8.50.—A behavioral hypothetico-deductive theory of perception and consciousness, relying heavily on ideas of Hull and Ashby, is presented. The emphasis is on visual perception. A notation derived from set theory is used. Ashby's notion of the multistable system is a central theme. 3 experiments making use of invert-

ing or distorting lens are reported. Ss wearing such lens only part of the time ultimately come to perceive the environment as remaining unchanged after taking off or putting on the lens. A mathematical appendix by Seymour Papert is included.—*C. T. Morgan*.

5990. Thinès, G. (Louvain U., Belgium) Contribution à la théorie de la causalité perceptive. [Contribution to the theory of perceptual causality.] Louvain, Belgium: Publications Universitaires Louvain, 1962. 124 p. Belg. Fr. 140.—A new series of experiments is reported on the phenomenological aspects of Michotte's coupling effect in the perception of induced motion. Of primary interest is the effect on the incidence of causal responses of the duration of the stationary object in the perceptual field before it is acted upon by the moving object. The integrative aspects of the movement of several point sources with common trajectories are also studied. It is concluded that the results of these experiments shed light on the very important role played by subjective factors in the formation of structures having causal significance.—*G. H. Mowbray*.

Illusions

5991. Kirschenbaum, Martin Jules. (U. Kansas) The effects of verbal reinforcement and experimenter attitude on the perception of a three-dimensional mirror cube illusion. *Dissert. Abstr.*, 1962, 22(9), 3273-3274.—*Abstract*.

5992. Murray, Patricia Ann. (Fordham U.) A quantitative study of the Ames' oscillatory illusion. *Dissert. Abstr.*, 1962, 22(11), 4099-4100.—*Abstract*.

Aftereffects

5993. Baird, J. C., Gulick, W. L., & Smith, W. M. (U. Delaware) The effects of regard upon the size of after-images. *Psychol. Rec.*, 1962, 12, 263-271.—3 experiments were conducted. In Experiment 1, with the use of a bracketing technique of measurement, the physical size of the negative after-image was found to be uninfluenced by different angles of regard (up, straight, and down). In Experiment 2 with a comparison technique (method of limits) the apparent size of the afterimage appeared significantly smaller when the eyes were elevated from the straight position. Experiment 3 compared directly the apparent size of the afterimage and angle of regard relative to the size of the image at a different angle of regard. The results agreed with those of the 2nd experiment. Relevance of the findings to the study of the moon illusion was discussed.—*R. J. Seidel*.

5994. Carlson, Jean Burke. (Northwestern U.) Effect of amount and distribution of inspection time and of length of decal interval on size of kinesthetic aftereffect. *Dissert. Abstr.*, 1962, 22(8), 2882.—*Abstract*.

5995. Pick, Herbert L., Jr., Hetherington, Marvis, & Belknap, Roland. (U. Wisconsin) The effects of differential visual stimulation after induction of visual aftereffects. *J. exp. Psychol.*, 1962, 64(5), 425-429.—The effects of 3 conditions of poststimulation on a Köhler-Wallach figural aftereffect and a Gibson negative aftereffect were investigated. Condition I was normal stimulation, obtained by looking around the room; Condition II was

homogeneous lack of stimulation, obtained by wearing a black blindfold; Condition III was homogeneous light stimulation obtained by exposure to a "ganzfeld." The Gibson aftereffect decreased normally under all 3 conditions. The ganzfeld enhanced the Köhler-Wallach aftereffect, the blindfold retarded the decrease in the aftereffect, and looking around the room permitted the normal disappearance of the figural aftereffect.—*J. Arbit.*

5996. Taylor, M. M. (Defence Research Medical Lab., Toronto, Canada) The distance paradox of the figural after-effect in auditory localization. *Canad. J. Psychol.*, 1962, 16(4), 278-282.—S indicated the radial locus of a noise source with reference to a visible scale. "The stimulus" and "the anchor" which immediately preceded and followed it were white noise at the same level. The position of the anchor was varied. With the anchor to the right the stimulus was displaced to the left, with maximal effect between 20° and 35°. With further separation the displacement was reduced until at 90° it approached zero. The results and those of Krauskopf are interpreted as displacement of the perceived locations of the sound sources, rather than that of the perceived medial plane.—*R. S. Davidson.*

5997. Taylor, M. M. (Defence Research Medical Lab., Toronto, Canada) Figural after-effects: A psychophysical theory of the displacement effect. *Canad. J. Psychol.*, 1962, 16(4), 247-277.—A linear model is proposed for predicting displacement effects of anchors on a single test point. The bias of the judged position of a point in space is a weighted average of the biases of the judgments relative to the different anchors and of the unbiased absolute judgment. Predicted functions are compared to the data of several experiments by different investigators, and the limitations of the model are discussed.—*R. S. Davidson.*

VISION

5998. Havens, Leston L., & Foote, Warren E. (Massachusetts Mental Health Cent.) The effect of competition on visual duration threshold and its independence of stimulus frequency. *J. exp. Psychol.*, 1963, 65(1), 6-11.—The effect of prior word usage on visual duration thresholds has been studied under tachistoscopic conditions permitting control of competing or interfering responses. The degree of competition among these responses was significantly correlated with threshold. Stimulus frequency was not a significant variable under these conditions. We conclude that visual duration thresholds are not primarily a function of the frequency of prior usage of stimuli but of the ability or inability of the stimuli to evoke high frequency competitive responses.—*Journal abstract.*

5999. Valter, V. (Slovenskej Akad. Vied, Bratislava, Czechoslovakia) Zariadenie pre binokulárnu intermitentnú svetelnú stimuláciu s možnosťou vzájomného fázového posunu zámkmitov. [A device for binocular intermittent light stimulation with the possibility of mutual phase shift of light flashes.] *Psychol. Stud., Bratislava*, 1961, 3, 265-268.—A description of a device for binocular intermittent light stimulation which, utilizing the features of polarised filters, renders it possible to reach a mutual phase shift of light flashes for both eyes that can be altered

continuously. (Russian & English summaries)—*V. Bricháček.*

Space Perception

6000. Bartley, S. Howard; Nelson, Thomas M., & Soules, Elaine M. (Michigan State U.) Visual acuity under conditions of intermittent illumination productive of paradoxical brightness. *J. Psychol.*, 1963, 55(1), 153-163.—Visual acuity was measured for intermittently illuminated Snellen type letter "Es." Several groups of naive students and both senior authors served as Os. Rates, pulse-to-cycle fractions, and intensities productive of brightness varying from enhancement (Brucke-Bartley) to Talbot levels were used. Visual acuity for the same targets in steady state conditions was also measured. Temporally induced brightness increases had an effect counter to intensity-produced brightness increases within the range of conditions used. Results were discussed in terms of the alternation of response theory.—*Author abstract.*

6001. Braunstein, Myron L. (U. Michigan) The perception of depth through motion. *Psychol. Bull.*, 1962, 59(4), 422-433.—Motion perspective is the phenomenon that as an object moves, the projections of its surface features and of its contours undergo certain regular transformations. The retinal image undergoes similar transformations. This aspect of depth perception has received comparatively little attention. Theory has been primarily based on gestalt formulations, and, more recently, an empirical approach has been suggested which is based on the use of high speed computers. The latter approach appears quite promising.—*W. J. Meyer.*

6003. Deutsch, J. A. A system for shape recognition. *Psychol. Rev.*, 1962, 69(6), 492-500.—2 variations of a neurologoical theory of shape recognition that accounts for many of the phenomena of shape constancy. Emphasis is placed on the role of the horizontal cells.—*C. T. Morgan.*

6004. Fisch, Ralph Irving. (U. Kansas) The effect of conditioning of attention on depth perception and speed of object recognition. *Dissert. Abstr.*, 1962, 22(7), 2473-2474.—*Abstract.*

6005. Gogel, W. C., Wist, E. R., & Harker, G. S. (Fort Knox, Ky.) A test of the size-distance invariance hypothesis. *USA Med. Res. Lab. Rep.*, 1962, No. 545. ii, 23 p.—The size-distance invariance hypothesis was tested using 3 magnitudes of effective interpupillary distance (base). Devices providing an increased, normal, or decreased base were used to view targets at 5, 10, 15, or 20 ft. Both perceived relative and perceived absolute size and distance were measured. The results were used to test the size-distance invariance hypothesis which states that, for an object of constant angular size, the ratio of perceived absolute size to perceived absolute distance is a constant. It was found that while perceived absolute size and perceived absolute distance were related, the ratio of the 2 varied significantly as a function of both physical distance and base.—*USA MRL.*

6006. Goldstein, Jacob, & Wiener, Charles. (State U. New York) On some relations between the perception of depth and of movement. *J. Psychol.*, 1963, 55(1), 3-23.—Gemelli's findings concerning directional differences in phenomenal speed were subjected to an experimental test. No evidence of consistent right-left differences in phenomenal speed was found. Other effects were obtained, none of which are described in Gemelli's paper. These included phenomenal changes in speed and phenomenal depth effects under conditions where 2 filmed disks were moving in opposite directions at the same uniform physical speeds along parallel horizontal pathways. Under other conditions "recoil" effects were obtained. The findings are discussed in relation to: the Gestalt laws of organization, the framework as a determinant of phenomenal speed, stereokinetic phenomena (including the kinetic depth effect), phenomenal distance, and various studies in the field of perception.—*Author abstract.*

6007. Kinsbourne, M., & Warrington, Elizabeth K. (National Hosp., London, England) The effect of an after-coming random pattern on the perception of brief visual stimuli. *Quart. J. exp. Psychol.*, 1962, 14(4), 223-234.—The perception of briefly exposed visual forms is shown to be masked by an after-coming random pattern stimulus of approximately equal intensity. This effect occurs only under certain well defined conditions; it is limited by the minimum stimulus exposure time in excess of threshold which overcomes masking (critical stimulus duration) as well as by the minimum interval between presentation of the 2 stimuli which permits evasion of the masking action (critical interval). Over the range of stimulus duration in which masking occurs, critical interval varied with stimulus duration in such a way that the interval multiplied by the stimulus duration equals a constant. Critical stimulus duration and critical interval at threshold are shown to vary little under a variety of conditions. The effect of the random pattern stimulus is limited to the part of the visual field to which it is presented.—*Journal abstract.*

6008. Kinsbourne, M., & Warrington, Elizabeth K. (National Hosp., London, England) Further studies on the masking of brief visual stimuli by a random pattern. *Quart. J. exp. Psychol.*, 1962, 14(4), 235-245.—A brief visual test stimulus may be masked by a preceding random pattern of roughly equal intensity in the same way as by a succeeding random pattern. The parameters of random pattern duration, interval between stimuli, and test stimulus duration limiting the masking effect, show a regularity very similar in the 2 conditions. When the random pattern precedes the test stimulus, the relationship between the 2 may be stated as follows:

$$\text{Stimulus duration} \times \text{interval} = \text{a constant.}$$

The identical effects are found when the 2 stimuli are presented separately, one to each eye, both for random pattern preceding and succeeding the test stimulus. It was concluded that masking resulted through the same central interaction, whether produced by the preceding or succeeding random pattern. The interaction may be related to, and occur within the limits of, apparent simultaneity of rapidly successive visual stimuli.—*Journal abstract.*

6009. Land, Edwin H., & Daw, Nigel W. (Polaroid, Corp., Cambridge, Mass.) Binocular combination of projected images. *Science*, 1962, 138 (Whole No. 3540), 589-590.—2 color-separation positive transparencies of a scene, one projected with "red" light and the other with tungsten lamp light, were superimposed on a screen. The light was polarized so that an O wearing an appropriate viewer could see both images in each eye or the "red" image in one eye and the "white" image in the other. These 2 situations gave different results, not the same results, as some previous investigators have claimed. Land's major results cannot be "obtained stereoscopically." We conclude that the process by which color is formed could possibly be a process of the retina or the lateral geniculate body, and does not necessarily have to be a process of the cerebral cortex as implied by the binocular experiments which purported to give the fuller gamut of color.—*Journal abstract.*

6010. Pierce, Jan Roberts. (U. Illinois) Some parameters of tachistoscopic word thresholds. *Dissert. Abstr.*, 1962, 22(10), 3749-3750.—*Abstract.*

6011. Smith, Olin W., Smith, Patricia Cain. (Cornell U.) On motion parallax and perceived depth. *J. exp. Psychol.*, 1963, 65(1), 107-108.—The adequacy of the combination of a "two-velocity" motion parallax and a continuous gradient of horizontal velocities as a stimulus for perceived depth and distance between 2 surfaces was tested on 182 children and adults. A shadow caster was used. Order of the surfaces in depth was perceived as would be predicted by motion parallax by all Ss except one. The distance of separation in depth of the surfaces was indeterminate. The perceived slant of the surfaces was not as predicted by parallax. No developmental differences were observed.—*Journal abstract.*

6012. Uhr, Leonard. (U. Michigan) "Pattern recognition" computers as models for form perception. *Psychol. Bull.*, 1963, 60(1), 40-73.—This paper reviews computer simulations of pattern recognition to indicate their relevance as models of form perception. The different types of programs are discussed and compared, and an attempt is made to assess their relative abilities. An attempt is made to exhibit certain similarities underlying superficially different approaches. Various specific simulations are compared with models and suggestions in the psychological literature. (159 ref.)—*Journal abstract.*

6013. van de Geer, John P., & de Natris, Peter J. A. Dutch distorted rooms from the seventeenth century. *Acta psychol., Amsterdam*, 1962, 20(2), 101-103.—The Ames' distorted rooms are based on the principle that any particular pattern of retinal stimulation can be provided by an infinite number of external configurations. These same principles underly several boxes painted by a pupil of Rembrandt as "trompe l'oeils" in the 17th century. Problems of interior painting led the Dutch school to avoid emphasis on the vanishing point. The peepbox solves the problem by eliminating a restricted fixation point.—*G. Rubin-Rabson.*

6014. Wienke, Richard, & Schwartz, Ira. The effect of spectacles and contact lenses on the Rayleigh equation. *USN Med. Res. Lab. Rep.*, 1961, 20(10, Whole No. 356), 4 p.—(Originally published in *Farbe*, 1960, 9(1-3), 49-52.) Refractive error

has been shown to be a factor in the establishment of color mixture data that involve red and green. Since size of retinal image is known to affect the red/green ratio also, the part played by magnification in ophthalmic correction of refractive error was explored. Correction by means of contact lenses was compared with that by spectacle lenses and found to produce no difference in red/green ratio. Size difference of the order of those inherent in the correction of ametropia do not appear to affect the red/green ratio.—*USN MRL.*

Color Vision

6017. Brindley, G. S. (U. Cambridge, England) **Two new properties of foveal after-images and a photochemical hypothesis to explain them.** *J. Physiol., London*, 1962, 164, 168-179.—The negative afterimage of a brief, very bright flash of light on the fovea shows sharp detail at first, but progressively blurs during the following 15-20 min. The blurring is not due merely to fading and is independent of the light conditions following initial exposure. The negative afterimage of an orange-red or orange flash is surrounded by a green halo which remains for at least 15 min. If shorter wave-length light is added to the flash, the color of the afterimage is unaffected, but the green halo either does not appear or disappears within 2 min. It is hypothesized that late foveal afterimages depend wholly on products of photolysis of cone pigments, which diffuse and decrease the sensitivity of other cones of the same type.—*D. R. Peryam.*

6018. National Physical Laboratory. (Teddington, England) **Visual problems of color: A symposium. Vol. 1.** New York: Chemical Publishing Company, 1961. 395 p. \$8.50.—Originally published by Her Britannic Majesty's Stationery Office in 1958, this is the 1st American edition of the symposium held in England in 1957. Volume 1 covers retinal chemistry and the physiology of vision, brightness matching and color matching, as well as color vision and the natural image.—*E. Borrowman.*

6019. National Physical Laboratory. (Teddington, England) **Visual problems of color: A symposium. Vol. 2.** New York: Chemical Publishing Company, 1961. 367 p. \$8.50.—(See 37: 6018) Volume 2 covers subjective color measurement, temporal effects, and defective color vision; electrophysiological aspects of vision, particularly color vision; and color theories.—*E. Borrowman.*

6020. Prits, A. K. (Sakhalinskii Complex Research Inst., Siberian Division Acad. Sciences, USSR) **Statsionarnye sostoyaniya otkrytykh sistem i teoriya tsvetnogo zreniya.** [Stationary states of open systems and the theory of color vision.] *Dokl. Akad. Nauk SSSR*, 1962, 142(6), 1403-1404.—Starting with the assumption of living tissue having a state of constancy of entropy with the rate increase of entropy equalling the rate of decrease, a relationship is derived between the frequency of neural impulses on the one hand, and the energy and visibility function of light on the other hand.—*H. Pick.*

6021. Shepard, Roger N., & Chang, Jih-Jie. (Bell Telephone Lab., Murray Hill, N. J.) **Stimulus generalization in the learning of classifications.** *J. exp. Psychol.*, 1963, 65(1), 94-102.—6 different classifications of the same set of 8 Munsell colors into 2 equal subtests were learned by a paired-associate method in which one verbal response was associated with each of the 4 colors in one subset while a 2nd verbal response was associated with each of the 4 colors in the other subset. A condition of identification learning was also included in which a different response was associated with each of the 8 colors. In accordance with a proposed principle of stimulus generalization for classification learning, 78% of the variance of the difficulties of the 6 classifications was found to be accounted for by the pair-wise confusions among the same stimuli as determined from identification learning.—*Journal abstract.*

6022. Thomas, David R., & Hiss, Richard H. (Kent State U.) **A test of the "units hypothesis" employing wave-length generalization in human subjects.** *J. exp. Psychol.*, 1963, 65(1), 59-62.—An experiment was performed to test 2 hypotheses suggested by Mednick and Freedman (1960) concerning the role of the number of intervening test stimuli in determining generalization decrement. 3 different groups of 20 female college students viewed a monochromatic light of 530 m μ (green) for 60 sec. and then were subjected to 9 different random series of wave lengths, with instructions to respond only to the original color. Group I was tested for generalization with the series 520-540 m μ in 5-m μ steps; Group II received 510-550 m μ in 10-m μ steps; whereas Group III received 490-570 m μ in 20-m μ steps. In agreement with Mednick and Freedman it was found that the more stimuli intervening between the CS and the test stimulus the greater the generalization decrement. Contrary to their position, however, the physical size of the stimulus unit was also found to be a significant factor.—*Journal abstract.*

Visual Sensitivity

6023. Gavini, Hélène. **Apprentissage et transfert dans le seuil différentiel de luminance.** [Learning and transfer in differential thresholds of luminance.] *Bull. Cent. Etud. Rech. Psychotech.*, 1962, 11(1), 13-25.—36 persons participated in the experiment. They were divided into 6 groups corresponding to 3 levels of luminance of the reference-field and to the 2 types of learning (distribution and massed). It was found that the differential threshold of luminance decreases during successive tests, the distributed learning being more efficient than the massed one. The regression curve of the threshold values in terms of the successive tests is not linear,

most progress occurring at the beginning of learning. The transfer phenomenon is very clear and shows that central factors are certainly responsible for this improvement, but "detailed consideration of the results indicates that it might well be that these factors are not solely responsible for the progress achieved."

Eye Movements

6028. Bang, Vinh, & Rutschmann, Jacques. **Un dispositif destiné à enregistrer les mouvements oculaires.** [An arrangement for the study of eye movements.] *Arch. Psychol., Geneva*, 1961, 38 (Whole No. 150), 143-151.—A description of the apparatus and procedures for the measurement of eye movements of Ss who are asked to make perceptual comparisons. The recording method involves direct filming of the movements of the reflection of the cornea.—*H. C. Triandis.*

6029. Gurevich, B. KH. (Inst. Physiology, Leningrad, USSR) **Znachenie "obratnykh svyazey" po I. P. Pavlovu v formirovani i i protekanii uslovnnykh refleksov.** [Significance of "feedback" according to I. P. Pavlov in the formation and development of conditioned reflexes.] *Vop. Psikh.*, 1962, No. 3, 85-94.—A feedback model based on conditioned eye movement experiments of the author is used to explain complex behavior such as constancy and to relate this behavior to elementary conditioned reflexes. The author's previous experiments have shown that eye movements can be conditioned to

auditory signals with points of light serving as the UCS. Although the characteristics of these eye movements are different than unconditioned eye movements they are more or less reliable themselves. In order for such movements to occur and themselves to be corrected, the author hypothesizes the existence of a direct connection between a proprioceptive center and the eye-movement effector center. This idea is then used as a means of explaining phenomena such as constancy whereby information seems to be added to the basic stimulation.—*H. Pick.*

6030. Khomskaya, E. D. (Moscow, USSR) **K. probleme afferentatsii dvizhenii glaz.** [On the problem of afferentation of eye movements.] *Vop. Psikh.*, 1962, No. 3, 73-84.—Eye movements were recorded by photoelectrical cells with light reflected from the eye while Ss were asked to perform 4 tasks. The 1st task was to look back and forth between 2 points of light 30° apart. The 2nd was to track a light moving back and forth through a 30° displacement at rates which varied from .32 to 2.08 cps. The 3rd task was a repeat of the 1st to see if fatigue effects occurred. The 4th task was to track a moving light by memory, i.e. to continue tracking movements after the light was extinguished. In the 1st task and 3rd task there occurred saccadic eye movements with short fixations at the 2 light points. The average rate for all Ss was 1.27 cps but large individual differences were noted. In the 2nd task eye movements were not saccadic but accurately conformed to the movement of the light point of light. In the 4th task as soon as the moving light was extinguished the tracking movements reverted to saccadic movements.—*H. Pick.*

6031. Law, Thomas, & Devalois, R. L. (U. Michigan) **Periorbital potentials recorded during small eye movements.** *Pap. Mich. Acad. Sci. Arts Lett.*, 1958, 43, 171-180.—"The present study was designed to refine our knowledge of the characteristics of the periorbitally recorded potential for eye movements of small extent." Ordinary cup disc-type EEG electrodes were attached to the skin about the eye with black electrical tape. Modern electrical equipment and techniques apparently permit detection of "eye movements as small as 0.5°. . . There is a linear relationship between eye movements of 0.5 to 15° and periorbitally recorded potential changes. . . Two-dimensional displays of eye movements are not only feasible but will permit simple unencumbered monitoring of ocular motion in a wider variety of situations where optical or photographic techniques are unsuitable."—*S. J. Lachman.*

6032. Piaget, Jean, & Bang, Vinh. **Comparaison des mouvements oculaires et des concentrations du regard chez l'enfant et chez l'adulte.** [Comparison of the eye movements and eye fixations of children and adults.] *Arch. Psychol., Geneva*, 1961, 38 (Whole No. 150), 167-200.—Differences in the eye movements and fixations of children and adults were obtained when the Ss perceived a variety of vertical and horizontal lines. Children's fixations were less adapted to the figure to be explored and to the required point of fixation.—*H. C. Triandis.*

6033. Piaget, Jean, & Bang, Vinh. **L'enregistrement des mouvements oculaires en jeu chez l'adulte dans la comparaison verticales, horizontales ou oblique et dans les perceptions de la figure**

en équerre. [Eye movements of adults in the comparison of vertical, horizontal and oblique lines and in the perception of the L-shaped (with equal size of lines) figure.] *Arch. Psychol., Geneva*, 1961, 38 (Whole No. 150), 89-141.—Analysis of eye movements from the point of view of exploration, distribution, and duration of fixation permits explanations of certain varieties of the horizontal-vertical illusion.—H. C. Triandis.

CHEMICAL SENSES

6034. Kalmus, H., & Trotter, W. R. (University Coll., London, England) Direct assessment of the effect of age on P. T. C. sensitivity. *Ann. hum. Genet.*, 1962, 26(2), 145-149.—Threshold changes of 110 individuals retested after a lapse of between 10 and 15 years are reported. There were 61 increases and 22 decreases in threshold. There was a high correlation between the test and retest values. The rate of decline in sensitivity does not seem to depend on age, thyroid condition, or taster status, but women, who usually are somewhat more sensitive than men, deteriorate more rapidly.—S. G. Vandenberg.

6035. Rosen, A. A., Peter, J. B., & Middleton, F. M. Odor thresholds of mixed organic chemicals. *J. Water Pollut. Control Federat.*, 1962, 34(1), 7-14.—Thresholds were measured by a modified method of limits (consistent series method). Judges sniff samples representing a log series of increasing concentrations of a substance in water. Water "blanks" are randomly interspersed. Threshold is that concentration above which all samples are correctly identified as "positive" or "negative." Thresholds, based on averages for 16-20 Ss, were determined for 1-butanol, p-cresol, pyridine, and for mixtures of these substances in varying proportions. The phenomenon of addition (the concentration of each component at the threshold of the mixture is below the threshold concentration of the component) was found with 6 of the 7 mixtures investigated. Synergism (the total olfactories represented in the concentrations of the components at the threshold of the mixture is less than one) was found in 2 of the 7 mixtures.—D. R. Peryam.

SOMESTHESIS

6036. Gibson, James J. Observations on active touch. *Psychol. Rev.*, 1962, 69(6), 477-490.—"A series of observations, both introspective and behavioral, confirms the distinction between touching and being touched. The former is a channel for a great variety of information about the environment, but whether it should be considered one or several senses is a matter of definition. The simple formula that it consists of passive touch plus kinesthesia is insufficient. The hypothesis of two components of stimulation, one exterospecific and one propriospecific, is more promising."—C. T. Morgan.

6037. Greene, Leon C., & Hardy, James D. (USN Air Development Cent., Johnsville, Pa.) Adaptation of thermal pain in the skin. *J. appl. Physiol.*, 1962, 17, 693-696.—Thresholds were determined on blackened skin of forehead and forearm over areas of 16 cm.² during exposure to thermal radiation for periods up to 50 min. Intensity of stimulation was controlled by S to maintain threshold pain. After the initial period of adjustment by S, radiation inten-

sity was generally maintained constant although skin temperature decreased slightly. Once pain had been established it did not disappear. It is inferred that thermal pain does not adapt for near-threshold stimulation.—D. R. Peryam.

6038. Harvey, O. J., & Campbell, Donald T. (U. Colorado) Judgments of weight as affected by adaptation range, adaptation duration, magnitude of unlabeled anchor, and judgmental language. *J. exp. Psychol.*, 1963, 65(1), 12-21.—Ss were first presented a series of 5 weights under varied conditions and then exposed additionally to extreme anchoring stimuli. $\frac{1}{2}$ of the 160 Ss made their judgments in ounces (Physical language) and the other half in 1-5 categories (Comparative language). The design under each language was a $2 \times 2 \times 2$ factorial: Narrow and Wide ranges of the standard weights designed to produce common geometric means or adaptations levels; Weaker and Stronger scales, represented by variation in number of pre-anchor trials; and Lighter and Heavier anchors. All 4 variables significantly affected judgments, indicating the importance of parameters generally not treated in adaptation level theory and suggesting that some of the anchoring effects typically obtained are affected by the judgmental language.—Journal abstract.

6039. Hawkes, Glenn R. (Lockheed-Georgia Co.) Predictability of multidimensional absolute identifications from information transmitted with unidimensional stimuli. *J. Psychol.*, 1962, 54(2), 309-316.—Experienced and naive Os made absolute identifications of electrical cutaneous stimuli varying in both intensity level and duration. Maximum information transmission was 2.97 bits, with combinations of 4 intensities and 4 durations, a little less than the simple summation of efficiency with the dimensions used singly. In sessions with combinations of an unequal number of intensity levels and durations, experienced Os transmitted significantly more information and both groups were more efficient when identifying combinations with more durations than intensity levels. Even though Os absolutely identify (unidimensional) intensities or durations with about equal efficiency, the present results indicate that the dimensions are not fully interchangeable.—Author abstract.

6040. Jarvik, Murray E., & Wolff, Berthold B. (New York U. Medical Cent.) Differences between deep pain responses to hypertonic and hypotonic saline solutions. *J. appl. Physiol.*, 1962, 17, 841-843.—Aqueous NaCl solutions (0.2 ml.) were injected into needles inserted in the gluteus medius muscles of 12 Ss. Duration and intensity of pain were related to NaCl concentration. Latency and duration were significantly greater with hypertonic solutions. Hypertonic saline tended to induce reports of a diffuse, dull ache, whereas hypotonic produced descriptions of sharp, pricking, well-localized pain.—D. R. Peryam.

6041. Lele, P. P. (Massachusetts General Hosp., Boston) An electrothermal stimulator for sensory tests. *J. Neurol. Neurosurg. Psychiat.*, 1962, 25(4), 329-331.—Description of apparatus delivering thermal stimuli of intensities above and below skin temperatures at the site of application. The instrument consists of a thermojunction of 2 different semiconductors, a low-voltage, high-current power supply and

a current reversing switch. When a current is passed through the semiconductors, one end of the junction becomes warmer, the other cooler than initially; reversal of the direction of the current reverses the thermal effects. Stimulus temperatures range from 10° C. to 45° C.; temperature changes can be effected rapidly; any given temperature may be maintained for any desirable time period.—*M. L. Simmel.*

6042. Margarida, R., Hardy, J. D., & Hammel, H. T. (U. Pennsylvania) **Measurement of the thermal pain threshold of the hard palate.** *J. appl. Physiol.*, 1962, 17, 338-342.—Individually fitted thin-walled aluminum thermodes through which water, alternately 37° C. or a higher test temperature, was rapidly circulated were used to determine the pain threshold in 4 Ss. Each was exposed to 288 stimuli in the range of 40°-49° C. in 6 experimental periods. 44.5° C. evoked the 1st reports of pain; 47.7° C. and above always evoked pain. A preliminary study is reported of the buccal temperature changes occurring during drinking hot beverages.—*D. R. Peryam.*

6043. Nelms, J. D., & Soper, D. J. G. (Royal Air Force Inst. Aviation Medicine, Farnborough, Hampshire, England) **Cold vasodilation and cold acclimatization in the hands of British fish filleters.** *J. appl. Physiol.*, 1962, 17, 444-448.—Ss were 11 filleters and 9 controls. The left hand was immersed in stirred ice and water mixtures. Vasodilation occurred significantly earlier in the filleters and their hand skin temperatures were higher both during initial vasoconstriction and after vasodilation. Some control Ss fainted and all were distressed, whereas the filleters were unaffected. The difference is interpreted as due to the filleters being accustomed to working with their hands in very cold water.—*D. R. Peryam*

6044. Ronco, Paul G. (Inst. Psychological Research) **An experimental quantification of kinesthetic sensation: Extent of arm movement.** *J. Psychol.*, 1963, 55(1), 227-238.—The present study was concerned with the quantification of one attribute of kinesthetic sensation, namely extent of movements. A ratio scale of sensory magnitude for the attribute was developed using blind positioning movements and the psychophysical techniques of magnitude estimation and fractionation procedures. The resulting scale, the "Kine" scale, demonstrates that the subjective magnitude of extent of arm movement grows as a power function of the stimulus magnitude.—*Author abstract.*

6045. Stevens, S. S., & Harris, Judith Rich. (Harvard U.) **The scaling of subjective roughness and smoothness.** *J. exp. Psychol.*, 1962, 64(5), 489-494.—"Preliminary experiments showed that Os can make consistent judgments of tactual roughness and smoothness. The stimuli were 12 grits of emery cloth. Magnitude estimations of roughness and smoothness produced straight lines when plotted (log-log) against grit number. The exponents of these power functions were determined in two experiments with magnitude estimation and one with cross-modality matching against loudness. All three experiments gave results that were power functions of grit number with exponents in the vicinity of -1.5 for roughness and +1.5 for smoothness. The cross-modality matches also confirmed the exponents determined by magnitudes estimation."—*J. Arbitt.*

6046. von Békésy, G. (Harvard U.) **Lateral inhibition of heat sensations on the skin.** *J. appl. Physiol.*, 1962, 17, 1003-1008.—"Many of the similarities that have been found between the organ of Corti, the eye, and the vibratory skin sensations are a consequence of lateral inhibition, and these similarities can be extended to heat sensations on the skin also. The chief differences lie in their numerical values. Analogues in heat sensations can be demonstrated for such phenomena as Mach bands and directional hearing, as well as the very pronounced sharpening effects of the spatial distribution of the sensation magnitude for traveling waves."—*D. R. Peryam.*

HEARING

6047. Bryden, M. P. (McGill U., Canada) **Order of report in dichotic listening.** *Canad. J. Psychol.*, 1962, 16(4), 291-299.—With different digits presented simultaneously to each ear, S responded following series of 3, 4, or 5 pairs, presented with ½-, 1-, or 2-sec. intervals. At the rapid rate most Ss reported the numbers heard by one ear followed by those of the other; while with slow presentation reports tended to follow the temporal order and there was evidence of rehearsal between pairs. The longer the series the more errors, but length had no consistent effect upon order of recall. With pairs presented through stereospeakers, the "ear order" of response became less frequent as the separation between speakers decreased.—*R. S. Davidson.*

6048. Bryden, M. P. (McGill U.) **Ear preference in auditory perception.** *J. exp. Psychol.*, 1963, 65(1), 103-105.—In a dichotic listening experiment, normal adult Ss identified numbers presented to the right ear more accurately than numbers presented to the left ear and preferred to report the material from the right ear first. To evaluate the effect of order of report a further experiment was performed (N = 32) in which Ss were instructed to report each channel first equally often. When 3 or 4 digits were presented to each ear, most Ss identified material from the right ear more accurately than material from the left ear. When 5 digits were presented to each ear, this difference was not observed. The findings suggest that the auditory system is better organized for the perception of verbal material presented to the right ear.—*Journal abstract.*

6049. Frey, Allan H. (Cornell U.) **Human auditory system response to modulated electromagnetic energy.** *J. appl. Physiol.*, 1962, 17, 689-692.—"Using extremely low average power densities of electromagnetic energy, the perception of sounds was induced in normal and deaf humans. The effect was induced several hundred feet from the antenna, the instant the transmitter was turned on, and is a function of the carrier frequency and modulation. Attempts were made to match the sounds induced by electromagnetic energy and acoustic energy. The closest match occurred when the acoustic amplifier was driven by the rf transmitter's modulator." Locations peripheral to the cochlea are ruled out as possible sites for the sensor.—*D. R. Peryam.*

Speech Perception

PARAPSYCHOLOGY

6052. Girden, Edward. (Brooklyn Coll.) A review of psychokinesis (PK). *Psychol. Bull.*, 1962, 59(4), 353-388.—"Few of the PK reports fulfill the basic requirement of a psychological experiment. To have psychological justification, there must be a controlled comparison such as wish for versus wish against, or wish for versus no wishing, or Believers versus Disbelievers. . . Evidence of PK as a psychological phenomenon is therefore totally lacking. And this deficiency will persist until the effect is produced in the presence of a specified psychological variable, and the effect does not appear in its absence."—W. J. Meyer.

ENVIRONMENTAL EFFECTS

6053. Baranovskii, V. V., Emel'ianov, M. D., & Kuznetsov, A. G. (Moscow, USSR) O vzaimodeistvii analizatorov v usloviakh poleta na samoletakh i kosmicheskikh korabliakh. [Interaction between the analyzers during flights on planes and spaceships.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(6), 1001-1010.—Relations between the visual, vestibular, and motor analyzers were studied in 1 S under laboratory conditions of flight. The apparatus consisted of a swinging chair, a revolving chair with unstable support, and a cylinder with black and white stripes revolving around S. Recordings were made of the following: motor reactions, biopotentials of the skeletal muscles, pulse, respiration, blood pressure, and EEG. 2 experimental conditions were used: in one, S was sitting on a fixed chair, in the other he was placed on a chair with unstable support. When S was in a fixed position without any visual control of his body, the static muscular tensions inhibited the vestibular reflexes. In a tilting position, the muscular contractions became unstable and the vestibular reflexes more pronounced. As far as the visual analyzer is concerned, light as such does not affect the vestibular responses but the object and its position in space.—A. Cuk.

6054. Batten, Don Elton. (Washington State U.) The effects of sensory deprivation on auditory and visual sensitivity. *Dissert. Abstr.*, 1962, 22(11), 4091.—Abstract.

6055. Budiak, N. I. (Moscow, USSR) Posledeistvie dvigatel'nykh reaktsov kak pokazatel' individual'nykh osobennostei i funktsional'nogo sostoianiia vysshego nervnoi deiatel'nosti cheloveka. [The after-effect of motor reactions as indicator of individual characteristics and functional condition of the human higher nervous activity.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(6), 1029-1033.—Ss were 104 pilot students (age 17-20) who were instructed to respond with a RT key to sound stimuli following each other at regular intervals of 2, 4, and 10 sec. 1/2 of Ss were previously submitted to 15 min. of a

stressful experiment. It was found that RT was a function of stress and interval.—A. Cuk.

6056. Guedry, Fred E., Jr., & Graybiel, Ashton. (USN School Aviation Medicine, Pensacola, Fla.) Compensatory nystagmus conditioned during adaptation to living in a rotating room. *J. appl. Physiol.*, 1962, 17, 398-404.—Controlled tests on 7 men before and during a 64-hour period of rotation at 5.4 rev/min demonstrated that disorientation and nystagmus attributable to Coriolis acceleration effects diminished markedly. Compensatory nystagmus induced by head or whole-body movements was recorded more than one hour after rotation had ceased. Factors of possible significance in conditioning this effect are discussed, and contributions of compensatory and arousal factors to vestibular suppression are considered in relation to transfer of habituation.—D. R. Peryam.

6057. Marukhanian, E. V., Isakov, P. K., Asiamolov, B. F., Pavlov, G. I., & Usachev, V. V. (Moscow, USSR) Elektrofiziolgicheskoe issledovanie deiatel'nosti kozhnogo i dvigatel'nogo analizatorov v usloviakh deistviia uskorenniia. [Effect of acceleration on the activity of cutaneous and motor analyzers.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(6), 1021-1028.—5 Ss (age 23-35) were asked to estimate weights of equal looking jars while their EMG and GSR were recorded. The experiment was carried out under normal conditions and under conditions of acceleration (up to 7 g). When the weight was ascertained with the help of a slight movement of the hand and forearm, Ss underestimated the standards. With an increase in the extent of the movements, the weights were overestimated. Under conditions of acceleration (up to 3-4 g) the voltage of the biopotentials was growing in proportion to the increase of the heaviness of the arm while their frequency declined.—A. Cuk.

6058. Miller, Keith L., & Irving, Laurence. (Arctic Health Research Cent., Anchorage, Alaska) Local reactions to air cooling in an Eskimo population. *J. appl. Physiol.*, 1962, 17, 449-455.—Bare hand and facial temperatures of Eskimo men, women, and children were compared with those of white men during cooling in air at -3° and -7° C. Eskimo men and women had significantly higher minimal and terminal finger temperatures and less fluctuation than white men. Being accustomed to cold slowed cooling for white men. Eskimo children maintained finger temperature as well as white men not accustomed to cold. Hand discomfort was minor for adult Eskimos, but marked for most whites. Facial cooling was similar for adult groups, but cheek temperatures fell more rapidly for Eskimo children.—D. R. Peryam.

SLEEP & FATIGUE

6059. Collins, J. B., & Pruett, B. (Building Research Station, Garston, Hertfordshire, England) Perception time and visual fatigue. *Ergonomics*, 1962, 5(4), 533-538.—8 Ss (male students) viewed Landolt rings at near and far distances. Test periods were 2 hours. "Results . . . suggest that the time required to perceive accurately, objects at two different distances is worth considering as an indicator of (visual) fatigue."—B. T. Jensen.

6060. de Leeuwe, J. Relaxation et activité optimale. [Relaxation and optimum activity.] *Acta*

psychol., Amsterdam, 1962, 20(2), 128-138.—Several conceptions of "relaxation" are cited: a situation characterized by a considerably diminished activity of some peripheral organs plus a similarly diminished activity of the highest parts of the nervous system, or an advanced remission of muscular tension with undiminished normal activity of the higher central nerves. The question arises whether in combating labor pains without drugs the higher nervous activity should be maintained at normal levels.—G. Rubin-Rabson.

6061. Wilkinson, Robert T. (Applied Psychology Research Unit, Cambridge, England) **Muscle tension during mental work under sleep deprivation.** *J. exp. Psychol.*, 1962, 64(6), 565-571.—"Twelve Ss performed a 20-min. test of addition, once after normal sleep and once under 32-56 hr. sleep deprivation. Records of muscle tension (EMG) were taken from the inactive arm. The Ss who maintained performance best under the stress showed the greatest rise in EMG over normal levels. Knowledge of results disturbed this relationship. An independent measure of EMG taken under normal conditions predicted those Ss whose performance was impaired. Sleep deprivation may cause inefficiency even in Ss who maintain performance if their raised EMG reflects greater effort or energy expenditure; this may be the cost of maintaining normal levels of arousal and performance in face of the depressing influence of sleep deprivation per se."—J. Arbit.

MOTIVATION & EMOTION

6062. Grossart, Friedrich. **Gefühl und Strebung.** [Emotion and motivation.] Munich, Germany: Ernst Reinhardt, 1961. 196 p.—This entirely introspectional system of emotions is based on treatises which appeared in 1930 and 1931 in *Archiv für die gesamte Psychologie* (see 5: 87, 2632; 6: 111). Some later nonexperimental literature has been included. The most prominent European phenomenological and philosophical systems are discussed, and there is considerable emphasis on the differentiation of emotional states accompanying motivations.—J. C. Brengelmann.

6063. Rosensohn, William L. (Rutgers U.) **A logical method for making a classification of emotions, using Wilhelm Wundt's theory of emotion formation.** *J. Psychol.*, 1963, 55(1), 175-182.—An attempt is made to classify emotions according to a logical scheme provided, in part, by Wundt's analysis and theory of emotions. Thus, following Wundt, an emotion is considered first as a psychic compound, consisting of simple feelings in combination to form a single affective process. 3 pairs of simple feelings, originally isolated by Wundt, and appropriately symbolized by this writer, provide the basis for an abstract classificatory scheme, whereby an emotion may be represented by a formula or be assigned a position within a serial order or continuum of emotions, also formularized. The remainder of the paper is devoted to a systematic attempt to interpret such theoretic schemas.—*Author abstract.*

6064. Schachter, Stanley, & Singer, Jerome. **Cognitive, social, and physiological determinants of emotional state.** *Psychol. Rev.*, 1962, 69(5), 379-399.—"It is suggested that emotional states may be considered a function of a state of physiological

arousal and of a cognition appropriate to this state of arousal. From this follows these propositions: (a) Given a state of physiological arousal for which an individual has no immediate explanation, he will label this state and describe his feelings in terms of the cognitions available to him. . . . (b) Given a state of physiological arousal for which an individual has a completely appropriate explanation, no evaluative needs will arise and the individual is unlikely to label his feelings in terms of the alternative cognitions available. (c) Given the same cognitive circumstances, the individual will react emotionally or describe his feelings as emotions only to the extent that he experiences a state of physiological arousal. An experiment is described which, together with the results of other studies, supports these propositions."—C. T. Morgan.

PSYCHOMOTOR TASKS

6065. Borg, Gunnar, & Dahlström, Hans. **A pilot study of perceived exertion and physical working capacity.** *Acta Soc. Med. Upsaliensis*, 1962, 67(1-2), 21-27.—"This paper is a study of how the perception of exertion during a physical work test and the physical working-capacity correlates with an independent criterion. The test was conducted on a bicycle ergometer and the working-capacity was determined from pulse-rates and from the perceived exertion according to a rating scale. The validity of the two measures of the working-capacity was about the same. This study is only a pilot study but supports the idea that by using a simple rating scale for a physical work test the validity of the test may be increased."—C. T. Morgan.

6066. Břicháček, V. (Charles U., Prague, Czechoslovakia) **Vztah mezi směrem a rychlostí pohybu při kontinuální činnosti.** [Relation between direction and speed of motion.] *Ceskoslov. Psychol.*, 1962, 6(1), 36-46.—It was experimentally ascertained that the reactions in straight directions were quicker than reactions in oblique lines. The quickest reaction was from right to left. Reactions from up to down were quicker than those from down to up; also reactions to S were quicker than from S. When the signal board was in an oblique position, the speed of the reaction was slower than when it was in a horizontal or vertical position. No differences were found between the work of the right and left hand. (Russian & English summaries)—V. Břicháček.

6067. Bureš, Z. (Charles U., Prague, Czechoslovakia) **Individuální rozdíly v jednoduché laboratorní činnosti.** [Individual differences in simple laboratory activity.] *Ceskoslov. Psychol.*, 1962, 6(1), 47-63.—An attempt was made by means of a new special apparatus to make use of the psychological analysis of laboratory activity, consisting of long series (70-2000) of simple repetitive tasks, in the investigation of individual differences. After a survey of previous research, special attention being paid to work done in Czechoslovakia, a set of parameters describing the activity was selected. They are independent of each other and have nearly perfect normality of distribution, significantly differentiate the Ss, and demonstrate the relative stability under various experimental situations. (Russian & English summaries)—V. Břicháček.

6068. Čáp, J., & Lanc, O. (Charles U., Prague, Czechoslovakia) Přístroj pro výzkum pohybového dynamického stereotypu u člověka. [Apparatus designed for research of human dynamic motion stereotype.] *Ceskoslov Psychol.*, 1962, 6(1), 95-102.—Description of an instrument to produce periodic series of 20 intervals. Interval length can be adjusted independently and any combinations of 10 stimuli can be used. The course of S's motor movement on the keyboard is registered by oscillograph. (Russian & English summaries)—V. Bricháček.

6069. Crawford, A. (Road Research Lab., Harmondsworth, England) The perception of light signals: The effect of the number of irrelevant lights. *Ergonomics*, 5(3), 1962, 417-429.—3 Ss had 200 trials in identifying a signal under each combination of conditions of steady or flashing signal or background lights. A background of flashing lights increased response time more than a background of steady lights.—B. T. Jensen.

6070. Dinnerstein, A. J., & Lowenthal, M. (New York Medical Coll., N. Y.) Behavioral consequence of painful electric shock. *J. appl. Physiol.*, 1962, 17, 333-337.—Choice reaction time and hand steadiness were studied under conditions in which correct performance produced painful electric shock. Deterioration of task performance was found. It was greater when shock was applied to the active than to the passive hand. Tremor increased with shock intensity, and aspirin decreased the difference between shock and nonshock trials.—D. R. Peryam.

6071. Finzi, Hilda. (New York U.) Interchangeability of perceptual and motor activity in the release of organismic tension. *Dissert. Abstr.*, 1962, 22(11), 4078-4079.—Abstract.

6072. Howell, William C., & Kreidler, David L. (Ohio State U.) Information processing under contradictory instructional sets. *J. exp. Psychol.*, 1963, 65(1), 49-46.—Key pressing in response to spatially coded visual signals was studied as a function of 4 sets of instructions: (a) speed-accuracy, (b) speed, (c) accuracy, and (d) transmission rate (H_z/sec). Contradictory (speed-accuracy) and non-contradictory (H_z/sec) instructions resulted in comparable acquisition and performance functions on all 3 measures taken: speed, accuracy, H_z/sec . Behavior under conflicting instructions corresponded more closely to that for accuracy than to that for speed; S appeared to select a high accuracy criterion and to adjust speed to the maximum level permitted by it. Speed instructions caused S to lower his accuracy criterion appreciably, but with little compensation in increased speed.—Journal abstract.

6080. Suddon, Florence H., & Lavery, J. J. (Defence Research Medical Lab., Toronto, Canada) The effect of amount of training on retention of a simple motor skill with 0- and 5-trial delays of knowledge of results. *Canad. J. Psychol.*, 1962, 16(4), 312-317.—S pushed a lever to obtain a target pressure, with or without knowledge of results (KR); and with either 0-trial or 5-trial delay of KR. Ss with no-KR trials interposed did better on retention trials than Ss given the same total number of trials with KR. With both 0-trial and 5-trial delay, "The

amount retained is a function of the amount of training."—R. S. Davidson.

ATTENTION & SET

6081. Adams, Jack A., & Boulter, Lawrence R. (U. Illinois) **An evaluation of the activationist hypothesis of human vigilance.** *J. exp. Psychol.*, 1962, 64(5), 495-504.—2 experiments were performed to identify stimulus determinants of vigilance decrement in a complex visual monitoring task. Experiment I manipulated response-produced stimulation arising from the stimulation induced by head and eye movements and immediate memory. These variables had no effect on vigilance decrement. Experiment II introduced variety in head and eye movements by training the pattern of visual observing responses and then changing the pattern on a given trial. No effects on vigilance decrement were found. Problems in operationally defining the activationist hypothesis were discussed.—J. Arbit.

6082. Frankmann, Judith P., & Adams, Jack. (U. Illinois) **Theories of vigilance.** *Psychol. Bull.*, 1962, 59(4), 257-272.—The inhibition hypothesis of vigilance, derived from the classical conditioning model, has too many weaknesses for an adequate theory. The "attention" hypothesis is too loosely stated to provide an acceptable model of vigilance behavior. Similarly the "expectancy" hypothesis lacks precision, but it has served to stimulate a number of experiments. A physiological model, labeled the activationist hypothesis, has so far only been useful in after-the-fact explanation. This hypothesis does offer some potentially important clues, but there is a need to coordinate the physiological components with the molar concepts.—W. J. Meyer.

LEARNING

6083. Baird, Edity Munro. (Emory U.) **Learning expression of attitude under verbal conditioning and under concept formation procedures.** *Dissert. Abstr.*, 1962, 22(11), 4089-4090.—Abstract.

6084. Karlin, Lawrence, & Mortimer, Rudolf G. (New York U.) **Effects of visual and verbal cues on learning a motor skill.** *J. exp. Psychol.*, 1962, 64(6), 608-614.—"The effects of visual, verbal, and combined verbal-visual cues on the learning and retention of a crank-turning task were investigated. The task was to turn the crank at 99 rpm. The Ss were 45 right-handed males, 15 Ss in each condition. It was found that: (a) Overall superiority in retention tests of task performance measured by time within tolerance was due mainly to reduction to constant errors. (b) The verbal cue was inferior in learning but superior in retention tests when performance was measured by time within tolerance and magnitude of constant error. (c) The verbal cue was inferior to the visual and combined verbal-visual cues during both learning and retention trials when variable error was measured."—J. Arbit.

6085. Karlin, Lawrence, & Mortimer, Rudolf G. (New York U.) **Effect of verbal, visual, and auditory augmenting cues on learning a complex motor skill.** *J. exp. Psychol.*, 1963, 65(1), 75-79.—In comparing the effects of various additional cues on performance of a compensatory tracking task, a verbal cue group was significantly superior in final training

and transfer trials to a control group. Both visual and auditory cues were superior to the control but individually none of these differences was significant. Comparison of these with earlier results suggested that augmenting cues were most effective in transfer when they functioned to reward desirable patterns of behavior and develop standards of performance rather than to guide immediate action.—Journal abstract.

6086. Miller, Theresa M. (U. Pittsburgh) **Intelligence and laboratory learning: Two dimensions of laboratory tasks.** *Dissert. Abstr.*, 1962, 22(11), 4098.—Abstract.

6087. Whitman, James R., & Garner, W. R. (VA Hosp., Perry Point, Md.) **Free recall learning of visual figures as a function of form of internal structure.** *J. exp. Psychol.*, 1962, 64(6), 558-564.—"This experiment tested two hypotheses relating free recall learning to the form of the internal structure: (a) the ease of free recall learning depends not on the characteristics of the individual stimuli but on the characteristics of the entire subset to be learned; (b) when a subset of stimuli is characterized by simple contingencies between pairs of variables generating the set, free recall learning will be easier than when the subset is characterized by interactions involving three or more variables. Three different forms of internal structure in subsets of visual figures were compared. The results showed clear differences in the predicted direction and both hypotheses were substantiated."—J. Arbit.

Conditioning

6088. Arginteanu, Jules. (State U. Iowa) **Verbal conditioning, awareness and their relation as a function of measures of social desirability and of resistance to verbal conditioning.** *Dissert. Abstr.*, 1962, 22(8), 2873.—Abstract.

6089. Beck, Sally Bell. (U. Illinois) **Eyelid conditioning as a function of CS intensity, UCS intensity, and MAS score.** *Dissert. Abstr.*, 1962, 22(10), 3744.—Abstract.

6090. Bryan, James Homer. (Pennsylvania State U.) **The effects of stimulus variability upon the conditioning of the galvanic skin response.** *Dissert. Abstr.*, 1962, 22(11), 4091.—Abstract.

6091. Desroches, Harry Francis. (U. Tennessee) **Resistance to weakening influences as a function of the similarity between acquisition and weakening phases.** *Dissert. Abstr.*, 1962, 22(11), 4092-4093.—Abstract.

6092. Ebel, Harvey C., & Prokasy, William F. (Pennsylvania State U.) **Classical eyelid conditioning as a function of sustained and shifted interstimulus intervals.** *J. exp. Psychol.*, 1963, 65(1), 52-58.—39 Ss were given 1200 classical eyelid conditioning trials over 12 sessions of 100 trials each. The manipulated independent variable was interstimulus interval, the specific values employed being 200, 500, and 800 msec. Depending upon the treatment combination, some Ss received only 1 interstimulus interval throughout training, while others were shifted back and forth between 2 interstimulus interval values. The major results were (a) response frequency continued to increase beyond 400 training trials, though differences as a function of interstimulus interval were not statistically significant; (b) both mean and

SD of latency varied directly with interstimulus interval and changes in interstimulus interval; and (c) both mean and SD of latency decreased across training sessions. The data were interpreted in terms of an assumed reinforcement related to the temporal disparity between UCR and UCS onsets.—*Journal abstract.*

6093. Gormezano, I., Moore, John W., & Deaux, Edward. (Indiana U.) **Supplementary report: Yoked comparisons of classical and avoidance eyelid conditioning under three UCS intensities.** *J. exp. Psychol.*, 1962, 64(5), 551-552.—A previous study found that classical conditioning when experimentally equated in terms of partial reinforcement pattern and number of UCS occurrences by a yoking procedure, was inferior to avoidance conditioning. The present investigation was conducted to determine the effects of UCS intensity on such yoked comparisons of classical and avoidance conditioning. It was found that the classical procedure was inferior at each of the 3 UCS intensities to the avoidance method.—*J. Arbit.*

6094. Korn, Sam J., & Welch, Livingston. (New York Hosp.) **On the elimination of artifacts in GSR conditioning.** *J. Psychol.*, 1963, 55(1), 109-113.—Adaptation of GSR to a continuously presented visual stimulus (continuous stimulus method) was compared with results obtained in an earlier study in which Ss were continuously presented with one or another of 4 signal lights (continuous series method). Both studies involved 14 female Ss, duration of stimulation was approximately 25 minutes and no reinforcement was imposed. The number and magnitude of GSRs were greater in the continuous stimulus method than in the continuous series method. Only in the latter was adaptation quickly and reliably accomplished. Thus the advantages of this method and its implications for CR procedure are reaffirmed.—*Author abstract.*

6095. Leonard, Charles, & Winokur, George. (Washington U. School Medicine) **Conditioning versus sensitization in the galvanic skin response.** *J. comp. physiol. Psychol.*, 1963, 56(1), 169-170.—Whether or not the return of the response to an orienting stimulus (after it has undergone habituation) during GSR conditioning is a true conditioned response (CR) was tested by a differentiation method. 10 Ss were given 2 tones for 40 habituation trials. This was followed by a conditioning period in which one tone was paired with shock and the other was unpaired. Equal numbers of orienting responses (OR) reoccurred during the conditioning period with both paired and unpaired tones; but more conditioned anticipatory responses occurred with the paired than the unpaired tone ($p < .001$). The return of the OR is a sensitization response rather than a CR. The OR may be simply differentiated from the CR by its latency.—*Journal abstract.*

6101. Spence, Kenneth W., & Tandler, Blaine F. (State U. Iowa) **Differential eyelid conditioning under equated drive as a function of the reinforcing UCS.** *J. exp. Psychol.*, 1963, 65(1), 35-38.—The effects of varying the reinforcing properties of the paired UCS on differential conditioning under equated drive level (D) was studied. The high reinforcement (HR) group had the positive CS (500-cps tone) paired with a strong UCS (2.0 psi) at an optimal CS-UCS interval (500 msec.) while the negative CS (5000-cps tone) was paired with a weak UCS (.33 psi) at interval of 2550 msec. These conditions were reversed for low reinforcement group (LR). HR group performed significantly higher than LR group both for positive and negative CS. Differentiation of the discriminanda was greater for HR group. Since drive levels of 2 groups were equated the results may be interpreted as indicating greater amount of habit strength for both stimuli in case of HR.—*Journal abstract.*

Discrimination

6102. Standish, C. D., & Champion, R. A. (U. Sydney, Australia) **Spatial S-R contiguity in human discrimination learning.** *J. exp. Psychol.*, 1962, 64(5), 545-548.—"Two experiments on discrimination learning were conducted under conditions in which preliminary training was given with two pairs of stimuli in fixed spatial relations, followed by test learning involving the two pairs and their transposes. The aim was to test the effects of spatial S-R contiguity, for it was predicted that contiguity would cause positive transfer from training to test. The prediction was confirmed, and the result was interpreted in S-R terms with the hypothesis that contiguity, like between-pair similarity, promotes within-pair discriminations on the part of the learner, it being supposed that spatial contiguity has this effect through the more basic variable of temporal contiguity."—*J. Arbit.*

Verbal Learning

6103. Abou-Ghorra, Ibrahim Mansour. (U. Southern California) A study of affective sets: The effects of family and non-family verbal contexts on word-need stimuli in a word association experiment with reference to pleasant and emotional tones of associated verbal responses. *Dissert. Abstr.*, 1962, 22(9), 3262-3263.—*Abstract*.

6104. Asch, Solomon E., & Lindner, Marged. (Swarthmore Coll.) A note on "strength of association." *J. Psychol.*, 1963, 55(1), 199-209.—2 groups learned a paired associate task by the method of anticipation, with items differing in ease of recall. One group learned with the more difficult items, the other with the easier items in the 2nd position: The 2 groups differed markedly in learning performance. Subsequently $\frac{1}{2}$ of each group was tested in the forward direction, the other $\frac{1}{2}$ in the backward direction. Despite the difference in learning performance, the 2 groups were indistinguishable when the test of recall was identical. This finding, which confirms the principle of associative symmetry, demonstrates that an effect hitherto attributed to strength of association is a function of recall, or of item availability. It raises the further question whether associations once formed increase in strength with further practice. The symmetry of associations is incompatible with the conceptualization of an association as a stimulus-response connection.—*Author abstract*.

6105. Brown, A., Osterhout, C., & Voss, J. F. (Coll. Wooster, O.) The effect of one probabilistic verbal association upon the concomitant acquisition of a second association. *J. verbal Learn. verbal Behav.*, 1962, 1(1), 48-53.—"A modified paired-associate procedure was employed in which a stimulus word was presented on each trial with 1 or 2 response words. The probability ratio was varied for different groups. . . . It was found that A_1 response frequency for the .8 and .7 conditions increased as a function of the response probability of the association concomitantly presented. Alternation and run tabulations were performed which suggested that Ss were influenced by the sequential characteristics of the two associations."—A. E. Horowitz.

6106. Brown, S. C., & Battig, W. F. (U. Virginia) Partial serial-position constancy in non-serial paired-associate learning. *J. verbal Learn. verbal Behav.*, 1962, 1(1), 42-47.—"The role of serial-position cues in paired associate learning was investigated by holding serial position of pairs in the list partially constant while preventing actual serial learning. . . . significant facilitation resulted if pairs were held constant in serial position only after being responded to correctly for the first time. . . . little evidence was found for differences among serial positions in rate of paired-associate learning. . . . if 2 or 4 pairs were held constant in serial position on all trials, while the remaining pairs were varied, significantly more errors resulted than under the standard varied-order procedure."—A. E. Horowitz.

6107. Carroll, J. B., Kjeldergaard, P. M., & Carlton, A. S. (Harvard U.) Number of opposites versus number of primaries as a response measure in free-association tests. *J. verbal Learn. verbal Behav.*, 1962, 1(1), 22-30.—"An attempt was made to devise a classification scheme for the K-R [Kent-

Rosonoff] list, behaviorally, by instructing Ss to respond with an opposite to any stimulus word which seemed amenable to opposition. The resulting scoring system was then used in the analysis of published norms and of new association data gathered under the usual instructions. The following conclusions seem justified. (1) A large component of what is referred to as commonality of response to the K-R stimulus list is based upon the responses to a relatively small subset of stimuli which can be identified behaviorally and which are called opposite evoking stimuli (OES). (2) A score based upon the number of opposites given to the OES . . . are more reliable than the primary responses to the 72 non-opposite-evoking stimuli or the commonality score." There seem to be consistent patterns of individual differences across responses to OES and non-OES.—A. E. Horowitz.

6108. Caruth, Clifton J. (U. Southern California) Clinical implications of verbal learning without awareness: An experimental study. *Dissert. Abstr.*, 1962, 22(9), 3265.—*Abstract*.

6109. Crothers, E. J. (Indiana U.) Paired-associate learning with compound responses. *J. verbal Learn. verbal Behav.*, 1962, 1(1), 66-70.—"Sixty college students each received two six-item lists under each of three schedules of one or two practice trials and two tests. In each list, each of the six combinations of the color adjectives 'red,' 'green,' and 'blue' and the form nouns 'circle' and 'triangle' was randomly designated as a 'correct' response compound for one syllable. The main analysis consisted in computing the probability of a correct response component, conditional on an incorrect response on the other component of that compound. . . . The data support the hypothesis that the rate of conditioning of the noun component depends on whether the adjective component is conditioned."—A. E. Horowitz.

6110. Glanzer, M. (U. Maryland) Grammatical category: A rote learning and word association analysis. *J. verbal Learn. verbal Behav.*, 1962, 1(1), 31-41.—3 experiments were carried out, analyzing the difference between content words (nouns, adjectives, verbs, and adverbs) and function words (pronouns, prepositions, and conjunctions) in rote learning. In paired-associates (English word-nonsense syllable and nonsense syllable-English word orders), number of correct anticipations was greater for content words. The same words were given in a word association situation. Correlations between association latency, number of different words given by Ss, and correct anticipations in paired-associates provide no consistent basis for explanation of the difference in association value. When the words were put in minimal contexts (nonsense syllable-word-nonsense syllable), and these triplets were the responses in paired-associates, the function word triplets yielded more correct anticipations. "Analysis on the basis of the subjects customary speech unit" is offered as an alternative to explanation based on meaningfulness.—A. E. Horowitz.

6111. Harleston, Benard W. (Tufts U.) Task difficulty, anxiety level and ability level as factors affecting performance in a verbal learning situation. *J. Psychol.*, 1963, 55(1), 165-168.—The interactive effects of Taylor scale anxiety level, ability level, and difficulty level were investigated with a paired-associates learning task. While ability level

and task difficulty level emerged as statistically significant effects, anxiety level failed to appear as consistently significant. Further, the hypothesis that the effects of anxiety level on performance are a function of task difficulty level and ability level did not receive support. The implications of the sensitive role of ability level were discussed.—*Author Abstract.*

6112. Johnson, Ronald C. Reanalysis of "meaningfulness and verbal learning." *Psychol. Rev.*, 1962, 69(3), 233-238.—Underwood and Schulz, defining frequency as the frequency that trigrams appear contiguously in English words, found pronounceability to be significantly related to rate of learning, while frequency was not a major variable. This E defined frequency as the frequency that a trigram appeared as a discrete or relatively discrete sound unit in spoken English. Using the approach taken in this paper, frequency is most significantly related to rate of verbal learning while pronounceability is not a major variable. While it may be that other attributes of trigrams (such as m or a) which covary with the frequency that trigrams occur as sounds in the English language are more basic in influencing rate of verbal learning, one can say with certainty, that frequency, as defined herein, is an adequate predictor of rate of verbal learning.—*Journal abstract.*

Psychol.*, 1962, 64(6), 600-607.—Immediately before paired-associate learning one group was satiated on the response members with a control group satiated on words which were not response members. Satiation of words caused a decrease in their connotative meaning as measured on semantic scales and that the former group was slower in learning than the latter group. A subsequent experiment, using a retroactive inhibition paradigm, studied the effect of satiation treatment of stimulus words on the recall of already learned paired associates. The results were discussed in terms of an associational interpretation of semantic satiation.—*J. Arbit.*

6114. Kincaid, W. D., Jr., Bousfield, W. A., & Whitmarsh, G. A. (U. Connecticut) The parasitic reinforcement of verbal associative responses. *J. exp. Psychol.*, 1962, 64(6), 572-579.—"Two experiments were designed to test the following hypotheses: (a) The paired-associate learning of a meaningful response word to a nonsense syllable stimulus has the consequence of establishing connections between the nonsense syllable and the members of a group of verbal associative responses to the learned response word. (b) The strength of the connections established between the nonsense syllable and the associates of the learned response word is an increasing function of the cultural habit strengths of the associates as responses to the learned response word. . . . The results strongly supported the first hypothesis, but failed to support the second hypothesis as no significant functional relationship was found to exist between the choices of associates in the testing situation and their cultural frequencies of occurrence as responses to the meaningful words."—*J. Arbit.*

6115. Laffal, J., & Feldman, S. (VA Hosp., West Haven, Conn.) The structure of single word and continuous word association. *J. verbal Learn. ver-*

bal Behav., 1962, 1(1), 54-61.—A previously developed system of categorization was applied to the continuous word associations of 20 Ss and to the discrete associations of the Minnesota Kent-Rosanoff norms. A response category profile was drawn up for each stimulus under the 2 conditions. Overlap coefficient matrices were factor analyzed. 5 factors were found to both methods, and 1 that appeared only under the continuous condition.—*A. E. Horowitz.*

6116. Lockhead, G. R. (Johns Hopkins U.) Methods of presenting paired associates. *J. verbal Learn. verbal Behav.*, 1962, 1(1), 62-65.—"Three different methods of ordering a list of nine pairs of nonsense syllables to be learned were compared both when Ss were and were not told that their responses were correct or incorrect. The results showed that the method of presentation . . . is unimportant but the effects due to the presentation of partial knowledge of results are equivocal."—*A. E. Horowitz.*

6117. Peterson, Lloyd R., Hillner, Kenneth, & Saltzman, Dorothy. (Indiana U.) Supplementary report: Time between pairings and short-term retention. *J. exp. Psychol.*, 1962, 64(5), 550-551.—An earlier study found forgetting within 8 sec. after a single paired-associate presentation when other presentations filled the interval. The present study investigated the effect of an 8-sec. interval similarly filled which is inserted between the 1st and 2nd presentations of an individual pair later tested for retention. The paradoxical finding was that when an interval during which marked forgetting can be shown to occur is introduced between pairings, there is improvement in retention at long intervals.—*J. Arbit.*

6118. Rotberg, Iris C., & Woolman, Myron. (Human Resources Research Office, George Washington U.) Verbal paired-associate learning as a function of grouping similar stimuli or responses. *J. exp. Psychol.*, 1963, 65(1), 47-51.—Verbal paired-associate learning was measured when similar or dissimilar stimuli were grouped, and when similar or dissimilar responses were grouped. The following measures were employed: number of correct responses; type of errors made, i.e., errors indicating confusion between similar items and those indicating confusion between dissimilar items. The results indicated that learning was better when groups of stimuli were composed of similar items rather than dissimilar ones. The findings were interpreted in terms of discrimination and coding of the similar items.—*Journal abstract.*

6128. Buchwald, A. M. (Indiana U.) Variations in the apparent effects of "right" and "wrong" on subsequent behavior. *J. verbal Learn. verbal Behav.*, 1962, 1(1), 71-78.—In Experiment I, the probability of the repetition of 1 or 4 response numbers was studied as a function of E saying "Right" or "Wrong," (randomly determined) after the response. There was a rise in probability of response repetition after "Right" but "Wrong" had no effect. "In Experiment II, Ss had two lists with four response alternatives, and two lists with two alternatives. . . . With four alternatives S repeated responses to the same stimuli more often when Right followed the responses than when Nothing did. With two alternatives there were fewer repetitions following Wrong than following Nothing. With four alternatives there was no effect of Wrong and with two alternatives, no effect of Right."—*A. E. Horowitz.*

6129. Katz, Leonard. (U. Massachusetts) Monetary incentive and range of payoffs as determiners of risk taking. *J. exp. Psychol.*, 1962, 64(5), 541-544.—"One group of 18 Ss gambled for chips only and another group of 18 Ss gambled for chips worth 5¢ each. Three ranges of unknown payoffs were used, one at each of three sessions. The known payoff, the acceptance of which was the alternative to gambling, remained constant. Neither incentive nor range had a significant effect upon the total number of risks taken. The Ss gambled significantly more when the alternative to gambling was a loss (-1) than when it was a gain (+1). Several interactions were significant, including Range \times Value and Range \times Value \times Incentive. These led to the conclusion that gambling is affected differentially on +1 and -1 trials by the range of chips to be gained or lost, and by the interaction of range and monetary incentive."—*J. Rev.*, 1962, 69(5), 428-448.—"Following an outline of the Hullian and Perkins-Logan theories of stimulus-intensity effects, and a distinction between the role of these effects in learning and performance, four experiments were described which tested the relative merits of the two theories in situations limited to effects on performance. It was concluded from the series of experiments as a whole, that the Perkins-Logan theory is to be preferred to Hull's treatment of stimulus-intensity effects." (23 ref.)—*C. T. Morgan.*

6142. Jones, Joan E. Contiguity and reinforcement in relation to CS-UCS intervals in classical aversive conditioning. *Psychol. Rev.*, 1962, 69(3), 176-185.—The function relating the interval between the onset of the CS and the UCS to response strength in classical aversive conditioning is interpreted in terms of the joint action of 2 principles. Early in training the efficacy of conditioning depends mainly on the contiguity of CS and UCR but later mainly on the proximity of the CR to reinforcement (UCS). In both cases a bidirectional gradient is assumed to operate such that the greater the discontiguity of the events the less effective the learning. It is predicted that variations in experimental procedure, such as the latency of the response being conditioned, which affect the function relating the CS-UCS interval to response strength and that the shape of the learning curves depends on the CS-UCS interval used in training.—*Journal abstract.*

6143. Kelleher, Roger T., & Gollub, Lewis R. (Harvard Medical School) A review of positive conditioned reinforcement. *J. exp. Anal. Behav.*, 1962, 5(4, Suppl.), 543-597.—A critical analysis of the experimental data relevant to the concept of conditioned reinforcement. The conditioned reinforcing effectiveness of a stimulus is directly related to the

frequency of primary reinforcement occurring in its presence, but independent of the response rate or response pattern occurring in its presence. A stimulus can be established as a conditioned reinforcer by pairing it with an already established conditioned reinforcer rather than a primary reinforcer. The concepts of conditioned reinforcement and chained schedule can be used to integrate the data obtained with diverse techniques. (101 ref.)—*J. Arbit.*

6144. Logan, Frank A. **Conditional-outcome choice behavior in rats.** *Psychol. Rev.*, 1962, 69 (5), 467-476.—A conditional-outcome choice is one in which the reward for at least one of the alternatives depends upon the organism's performance. A series of studies was reported in which rats were given a choice between 2 alleys, in one of which they had to run slowly, choose the correct brightness, or turn in the correct direction in order to obtain reward. It was concluded that rats are indifferent between such an alternative and one in which the same frequency of reward was given regardless of performance. This finding was interpreted as indicating that distinguishable behaviors can be aggregated into a single response class even though they are differently reinforced.—*Journal abstract.*

Psychol.*, 1962, 54(2), 251-258.—2 variables were treated in a factorial design in which acquisition and reversal of an imitative response were examined. The results of the acquisition period, as in previous experiments, showed that prior failure in contrast to success led to facilitation of the

imitative response and that the more competent the model, the greater is the tendency to match his responses. No interaction of these variables was indicated. Similarly, the results for a succeeding series of trials in which the probability of reinforcement was reversed indicated facilitation of nonimitation for Ss who experienced prior failure and who were presented with a high competence model. Alternate interpretations of the results were offered.—*Author abstract.*

6149. Simon, Herbert A. (Carnegie Inst. Technology) **A note on mathematical models for learning.** *Psychometrika*, 1962, 27(4), 417-418.—It is shown that a rational learning curve developed by Estes for paired associate learning is a special case of a more general function. The latter is the product of 2 functions and assumes that the discovery and fixation aspects of learning are independent. The indications are that the form of one of the functions has not been tested sharply by Estes in the paired associate learning setting.—*Journal abstract.*

6150. Underwood, B. J., & Keppel, G. (Northwestern U.) **One-trial learning?** *J. verbal Learn. verbal Behav.*, 1962, 1(1), 1-13.—The experiment of Estes, Hopkins, & Crothers (see 35: 4453) is criticized as not crucially supporting the assumption of 1-trial learning in Estes' theory. (a) There are critical procedural artifacts. (b) ". . . even if the artifacts could be ruled out, we believe that the data presented could be interpreted handily by certain extant incremental theories." 2 experiments were run on paired associates, the results of which the authors feel would be extremely difficult to handle with any theory assuming 1-trial learning.—*A. E. Horowitz.*

6151. Zapan, G. (Bucharest, Romania) **Použitie princípu dynamického stereotypu v procese učenia.** [The use of the principle of the dynamic stereotype in the process of learning.] *Psychol. Stud., Bratislava*, 1961, 3, 97-114.—The author reviews his experience in this area. Indispensable conditions for creating a dynamic stereotype in man are: temporal orders of stimuli, transfer, back afferentation, optimum excitability in brain cortex, optimum intensity of stimuli, differentiation, generalization, and the interacting of 2 signal systems. Principles of the dynamic stereotype are also applied to the methods of teaching foreign languages and mathematics. (Russian & English summaries)—*V. Břicháček.*

RETENTION & FORGETTING

6152. Hellyer, S. (Defence Research Medical Lab., Toronto, Canada) **Supplementary report: Frequency of stimulus presentation and short-term decrement in recall.** *J. exp. Psychol.*, 1962, 64(6), 650.—A previous study showed a progressive improvement in recall scores with an increase in number of repetitions by S before the delay of recall began. The present study used visually presented material to reduce the likelihood of inadvertent interference by E of S's response pattern. The earlier conclusions are confirmed in that there is better recall with an increase in the number of stimulus repetitions and with shorter periods of delay before recall.—*J. Arbit.*

6153. Hodges, Walter Lee. (George Peabody Coll. Teachers) **The effect of task discriminability,**

response similarity, and learning ability on retroaction. *Dissert. Abstr.*, 1962, 22(8), 2883.—*Abstract*.

THINKING

6158. Deese, James. On the structure of associative meaning. *Psychol. Rev.*, 1962, 69(3), 161-175.—It is suggested that "associations derive in whole or part from the structures or categories of the human mind. . . . [The] implicit distributions of responses that define associative meaning may exhibit patterns of overlap because they are derived from simple structures. . . . [The] distribution of associates to any word provides the associative meaning of that word and the techniques necessary to apply this assumption to data."—*C. T. Morgan*.

6159. Lewicki, Andrzej. *Procesy poznawcze i orientacja w otoczeniu*. [The cognitive process and orientation in the environment.] Warsaw, Poland: Państwowe Wydawnictwo Naukowe, 1960. 243 p.—Using the experiments of Adrian and Pavlov (particularly the latter), the author develops a theory of cognition which embraces the conscious as well as the unconscious with a supporting physiological base. Cognition is more than the "mirroring of the environment in the central nervous system" or the "understanding of the environment"; it is an "orientation in the environment." This concept includes the notions of value, generalization, and self-actualization. The theory is designed to be applicable to man as well as animals but with considerations of variance in physiological make-up and man's ability to use non-biological values and abstractions.—*H. Kaczkowski*.

6160. Martinez, Carlos M. (Buenos Aires, Argentina) Conocimiento y proceso primario. [Cognition and the primary process.] *Acta psiquiat. psicol. Argent.*, 1962, 8(1), 60-64.—The hypothesis is set forth that there is a type of thinking which is related to a certain type of knowledge of a determined reality (the fantasy reality). This thinking process, besides logical coherence, has another coherence, which is a coherence of fantasy and which employs

a determined instrument, the fantasy body.—*W. W. Meissner*.

6161. Mednick, Sarnoff. The associative basis of the creative process. *Psychol. Rev.*, 1962, 69(3), 220-232.—An associative theory of creative thinking has been outlined. Differences between high creatives and low creatives have been predicted along specified dimensions. Predictions have been made regarding the effect on the creative process of some experimentally manipulable variables. The associative definition of the creative process has taken the operational form of a test. Some preliminary research with this test is described.—*Journal abstract*.

Deiatel.*, 1962, 12(4), 569-577.—Voluntary movements are those which originate in the cerebral cortex (Pavlov). They are subject to all the mechanisms of the conditioned reflex. Review of and evaluation of Soviet literature bearing on this point.—*A. Cuk*.

Problem Solving

6163. Davis, James H., & Restle, Frank. (Michigan State U.) The analysis of problems and prediction of group problem solving. *J. abnorm. soc. Psychol.*, 1963, 66(2), 103-116.—The time to solve a multiple-stage problem is the sum of the times consumed by separate stages. If each stage is a random all-or-none process, then time to complete a stage is an exponentially distributed random variable, and time to complete the problem will have a gamma distribution (under suitable simplifying assumptions). From this theory, the number of stages in a problem can be estimated and goodness-of-fit tested. Results on 3 word puzzles, administered to 178 individual college students, agreed with theory, and the estimates of number of stages in each problem agreed well with independent judgments of number of stages. The same problems also were administered to groups of 4 Ss. The data suggest that all Ss progress at their usual pace toward solution, except that an S who made a mistake in interpreting the problem consumes and wastes his share of the group's time. This result agrees with the additional observation that the apparent social structure of the groups, as determined from analysis of sociometric choices, was egalitarian. (18 ref.)—*Journal abstract*.

6164. Jordan, Nehemiah. The resolution of cognitive conflict under uncertainty: A critique. *Hum. Relat.*, 1962, 15(3), 277-279.—Zajonc and Burnstein (see 36: 2GG13Z) are accused of an experimental tautology from which only trivial results can be drawn.—*W. W. Meissner*.

6165. Knight, Kenneth E. (Carnegie Inst. Technology) Effect of effort on behavioral rigidity in a Luchins water jar task. *J. abnorm. soc. Psychol.*, 1963, 66(2), 190-192.—The experiment consisted of a paper-and-pencil problem solving task to test if the effort required to obtain 1 solution influences the S's ability to solve similar problems. The conclusions are that the greater the effort required to develop a solution procedure: (a) the slower the change to another more appropriate solution procedure, (b) the greater the propensity of change during extinction to an alternative decision

procedure that is similar to the learned procedure, and (c) the less the propensity to recognize and use a trivial decision procedure that is also feasible. The results were significant at the .05 level. The Ss were 46 male undergraduate students.—*Journal abstract.*

6166. Maier, N. R. F., & Solem, A. R. (U. Michigan) Improving solutions by turning choice situations into problems. *Personnel Psychol.*, 1962, 15(2), 151-157.—College students and supervisors were formed into 146 groups of 4 to reach a decision on a problem involving conflict. The leaders in the 96 experimental groups were given an instruction designed to make them view the situation more as a problem to solve than as a decision to make. The results suggest procedures, which prevent immediate acceptance of an obvious solution and which cause the group to examine decision making situations as problems to solve, tend to increase the number of alternatives that come up for consideration, thereby increasing the quality of group problem solving.—*A. S. Thompson.*

6167. Marron, Joseph Edward. (Fordham U.) The effect of manifest anxiety and induced anxiety on human performance on feedback and non-feedback complex problems. *Dissert. Abstr.*, 1962, 22(11), 4097-4098.—*Abstract.*

6168. Restle, Frand, & Davis, James H. Success and speed of problem solving by individuals and groups. *Psychol. Rev.*, 1962, 69(6), 520-536.—"A waiting-time model was developed to give a distribution of times to solution, for word puzzles. The distribution depends upon the number of stages involved in solving the problem. Experimental results showed that the theoretical distribution (gamma distribution) gives a good fit to the data, and the estimated number of stages agrees well with intuition and judgments. A theory of 'pooling of contributions' was developed to describe the superiority of groups over individuals in solving word puzzles. Experimental results suggested that subjects who have misunderstood the problem and will arrive at wrong answers, nevertheless consume their share of group time. With this addition, the pooling of contributions theory accurately predicts group problem solving data."—*C. T. Morgan.*

6169. Simon, Herbert A., & Simon, Peter A. (Carnegie Inst. Technology) Trial and error search in solving difficult problems: Evidence from the game of chess. *Behav. Sci.*, 1962, 7(4), 425-429.—The conclusion is reached that the discovery of "mating combinations by expert chess players requires neither prodigious memory, ultra-rapid processing capacities, nor flashes of insight. Combinations as difficult as any that have been recorded in chess history will be discovered by the selective heuristics we have outlined, with amounts of search and with processing speeds that do not appear extravagant in relation to the measures we have of simpler kinds of human information-processing performance. The evidence suggests strongly that expert chess players discover combinations because their programs incorporate powerful selective heuristics and not because they think faster or memorize better than other people."—*J. Arbit.*

6170. Sperow, Byron Paul. (U. Florida) A study of complex problem solving under indi-

vidual and group conditions. *Dissert. Abstr.*, 1962, 22(10), 3736-3737.—*Abstract.*

6171. Zajonc, Robert B., & Burnstein, Eugene. (U. Michigan) Reply to Dr. Jordan's comments. *Hum. Relat.*, 1962, 15(3), 280.—Jordan (see 37: 6164) misinterprets the use of uncertainty, making it equivalent to "lack of confidence." In their experiment, uncertainty had to do with the number of objective alternatives presented to Ss in messages. Messages with high uncertainty were found to be more frequently distorted, but the Ss' confidence was not investigated.—*W. W. Meissner.*

Concepts

6172. Bodansky, Margery. (Clark U.) A study of the representation of abstract concepts through the use of line patterns. *Dissert. Abstr.*, 1962, 22(7), 2456-2457.—*Abstract.*

6173. Bourne, Lyle E., Jr., & Bunderson, C. Victor. (U. Utah) Effects of delay of informative feedback and length of postfeedback interval on concept identification. *J. exp. Psychol.*, 1963, 65(1), 1-5.—The purpose of this experiment was to determine the independent effects of delay of informative feedback (IF), length of post-IF interval, and task complexity on concept identification. The 216 Ss served individually in a factorial design which combined 3 delays, 3 post-IF intervals, and 2 levels of task complexity. All Ss were given standard oral instructions about the task and served to a criterion performance of 32 consecutively correct stimulus identifications. Results indicated that task difficulty increased with complexity, performance improved linearly with increases in post-IF interval, increase in the post-IF interval was more facilitative in tasks of greater complexity, and delay of IF was an ineffective variable. The data require detailed modifications of a mathematical theory of concept identification.—*Journal abstract.*

6174. Golas, E. (U. Palatskii, Olmutz, Czechoslovakia) Izuchenie uslovii obobscheniya. [A study of the conditions of generalization.] *Vop. Psikh.*, 1962, No. 3, 95-105.—The errors made in a concept formation type task are used to study the process of generalization (which is defined as the discovery of the general in specific instances.) The concept task consisted of learning to respond to pictures of objects in an upright position and not to respond otherwise. Analysis of the results indicate that some Ss make many errors of omission and others make many errors of commission. These are considered to be 2 types of generalization errors. Examining the percentages of these 2 types of errors is claimed to be a very much more informative type of analysis than is usually carried out.—*H. Pick.*

6175. Harrow, Martin, & Buchwald, Alexander M. (Indiana U.) Reversal and nonreversal shifts in concept formation using consistent and inconsistent responses. *J. exp. Psychol.*, 1962, 64(5), 476-481.—Reversal shifts may be learned more quickly than nonreversal shifts because they involve responding to a dimension of the stimuli that was previously used. A 4-category card-sorting task in which both number and position variables could be used was employed. Some concepts required consistent responses and others inconsistent responses.

All reversal tasks were learned in fewer trials than comparable nonreversal tasks. Concepts requiring consistent responses were learned in fewer trials than concepts requiring inconsistent responses.—*J. Arbit.*

6176. Isaacs, I. David, & Duncan, Carl P. (Northwestern U.) **Reversal and nonreversal shifts within and between dimensions in concept formation.** *J. exp. Psychol.*, 1962, 64(6), 580-585.—In addition to a comparison of reversal during transfer with nonreversal shift to the same dimension, the experiment also evaluated the effect of nonreversal to a different dimension. The performance of all groups could be accounted for, in the main, by 2 factors: nonspecific transfer and a specific tendency to continue to respond in transfer to the dimension of stimuli reinforced during training.—*J. Arbit.*

6177. Johannsen, Walter J. (VA Cent., Wood, Wisc.) **Concept identification under misinformation and subsequent informative feedback conditions.** *J. exp. Psychol.*, 1962, 64(6), 631-635.—Using 4 degrees of misinformative feedback (MF), and 1, 3, or 6 irrelevant dimensions (DI), Ss were given MF/IF trials and then shifted to 100% informative feedback (IF). Under MF/IF conditions significant differences occurred as a function of MF, DI, and MF \times DI, with increasing MF and DI leading to poorer performance. Subsequent 100% IF learning was significantly affected by DI; including controls produced a MF \times DI interaction. Partialing out the effect of prior learning on the 100% IF data produced a significant MF effect. Some probability matching was found.—*J. Arbit.*

6178. Lachman, Roy, & Sanders, Joyce A. (Hollins Coll.) **Concept shifts and verbal behavior.** *J. exp. Psychol.*, 1963, 65(1), 22-29.—2 experiments on concept shifts were conducted to test a theoretical model of thinking. The model assumed that mediating responses follow the laws of overt verbal responses. Ratings of verbal labels for pairs of stimulus values confirmed an a priori shift classification of similar, neutral, and opposite. Transfer effects for the 3 types of shifts were compared on successive concept shifts. A quadratic transfer function was obtained for the similar, neutral, and opposite shift dimension. Inflection of the curve occurred at the neutral position. A negative displacement of the transfer function occurred after the 1st shift. The results were judged as more consistent with Bugelski and Cadwallader's reformulation of Osgood's transfer laws than with Osgood's original formulations.—*Journal abstract.*

6179. Mednick, Sarnoff A., & Halpern, Sharon. (U. Michigan) **Ease of concept attainment as a function of associative rank.** *J. exp. Psychol.*, 1962, 64(6), 628-630.—"Thirty Ss were presented with lists of 12 nouns and instructed to discover into what three groups the nouns could be divided and what adjective could describe each group. The lists consisted of concepts of equal levels of dominance; the position of the concept responses in the associative hierarchy was manipulated. The concepts having higher rank position in the associative hierarchy were attained more quickly and with fewer errors."—*J. Arbit.*

6180. Neisser, Ulric, & Weene, Paul. (Brandeis U.) **Hierarchies in concept attainment.** *J. exp. Psychol.*, 1962, 64(6), 640-645.—"Twenty Ss were employed in a study of the relative difficulty of at-

taining 10 different types of concepts. All types involved only the presence or absence of two properties, but some were hierarchically more complex than others. For example, 'Both A and B' is more complex than 'A' but less complex than 'Both A and B or neither.' The results indicate that the difficulty of a concept varies directly with its complexity. This order of difficulty does not appear when a computer program is used to attain the concept by simple elimination. It seems to reflect a hierarchical organization of conceptual processes in the Ss themselves."—*J. Arbit.*

6181. Peterson, Margaret Jean. (Indiana U.) **Some effects of the percentage of relevant cues and presentation methods on concept identification.** *J. exp. Psychol.*, 1962, 64(6), 623-627.—The number of responses prior to criterion was inversely related both to the percentage of relevant cues and to the temporal proximity of the instances associated with a given response. The lesser efficiency of heterogeneous presentation was not a function of the greater temporal intervals occurring between instances of the same concept, but rather of interference effects from other concepts. An interaction was found between the percentage of relevant cues and the method of presentation. Few Ss reported the presence of more than 1 relevant dimension for the problems with 2 or 3 completely redundant relevant dimensions.—*J. Arbit.*

6182. Wason, P. C. (University Coll., London, England) **Reply to Wetherick.** *Quart. J. exp. Psychol.*, 1962, 14(4), 250.—(See 37: 6184.)

6183. Wells, Herbert. (Yale U.) **Effects of transfer and problem structure in disjunctive concept formation.** *J. exp. Psychol.*, 1963, 65(1), 63-69.—3 studies dealt with the attainment of disjunctive concepts. The positive instances of disjunctive concepts contain either Values A or B, while conjunctive concepts are those whose positive instances contain both A and B. The former are typically more difficult to attain. The 1st experiment showed that training on disjunctive concept problems increases the proportion of Ss who offer a disjunctive concept when a conjunctive concept is also available. The 2nd experiment compared inclusive (A or B or both) and exclusive (A or B but not both) disjunctive problems. The latter were found to be more difficult in terms of the time to solution.—*Journal abstract.*

6184. Wetherick, N. E. (Medical Research Council Unit, Research Occupational Aspects of Ageing, Liverpool, England) **Eliminative and enumerative behaviour in a conceptual task.** *Quart. J. exp. Psychol.*, 1962, 14(4), 246-249.—P. C. Wason's paper "On the Failure to Eliminate Hypotheses in a Conceptual Task" (see 35: 1737) is criticized on the grounds that the task set is in important respects untypical of problem-solving situations in general. It is suggested that few or no Ss are "eliminators" in Wason's sense and that although many are "enumerators" in his sense, enumerative behavior is a function of the situation. An experiment is reported in which it appears that modification to the situation can sharply reduce the incidence of enumerative behavior and increase the S's chance of success at an early stage. The frequency with which hypotheses are directly eliminated is shown to be very low in all groups.—*Journal abstract.*

6185. Wilson, John Carroll. (U. Cincinnati) The effect of abstraction and generalization orientation on the creation of concepts. *Dissert. Abstr.*, 1962, 22(8), 2891.—*Abstract*.

DECISION & INFORMATION THEORY

6186. Anker, James M., Townsend, John C., & O'Connor, James P. (VA Hosp., Perry Point, Md.) A multivariate analysis of decision making and related measures. *J. Psychol.*, 1963, 55(1), 211-221.—49 measures of decision making, intelligence, personality traits, and vocational interests and values were administered to 202 college students. These measures were intercorrelated, factor analyzed, and orthogonally rotated. 9 factors were identified, 5 of which contained decision making measures; decision time, intelligence, sequential effects of successes and failures, decision confidence, and odds preference. The 4 other factors were identified as adjustment-maladjustment, technical vs. interpersonal orientation, cultural vs. managerial orientation, and scientific creativeness vs. practical orientation.—*Author abstract*.

6187. Carlsmith, J. Merrill, & Aronson, Elliot. (Harvard U.) Some hedonic consequences of the confirmation and disconfirmation of expectancies. *J. abnorm. soc. Psychol.*, 1963, 66(2), 151-156.—In a test of the hypothesis that events which disconfirm expectancies will be perceived as unpleasant, Ss tasted a random sequence of sweet and bitter solutions. On the basis of certain signals given by the E, they developed expectancies or hypotheses about whether the next solution would be bitter or sweet. On trials when the Ss' expectancies were disconfirmed due to incorrect signals, the solutions were judged to taste more unpleasant. Thus, a bitter solution was rated more bitter; a sweet solution was rated less sweet. The results were interpreted in terms of Festinger's theory of cognitive dissonance.—*Journal abstract*.

6188. Flynn, John Charles. (Ohio State U.) Cooperative and non-cooperative game strategies as a function of perceived differential ability in the triad. *Dissert. abstr.*, 1962, 22(7), 2463-2464.—*Abstract*.

6189. Ghosh, A. S. (Patna, India) Number favouritism and spread of effect. *Indian J. Psychol.*, 1962, 37(2), 67-73.—A sample of college students was asked to write at random the numbers from 1 to 10 for a 2-minute period. A strong tendency towards number-favouritism was confirmed, with repetition of responses negatively correlated with response variability. An inverse position gradient of response variability was also found, indirectly supporting the existence of a so-called gradient of effect. They study supported Jenkins' "guessing sequence" and "probability bias" hypotheses, "and emphasized the importance of 'number favouritism' as a partial determinant of the 'spread of effect' phenomenon."—*J. T. Cowles*.

6190. LaBerge, David. (U. Minnesota) A recruitment theory of simple behavior. *Psychometrika*, 1962, 27(4), 375-396.—A statistical theory of choice is developed using a sequential sampling assumption. Response latency distributions for certain simple reaction-time situations are derived and

tested. Both response probability and response latency measures are developed for a 2-alternative judgment situation and the relationship between the 2 measures explored. The sampling parameter is proposed as a means of representing incentive conditions in choice situations and ROC curves are obtained by appropriate manipulations of this parameter. A solution to the overlap problem in simple discrimination-learning situations is also derived. (29 ref.)—*Journal abstract*.

6191. Lanzetta, John T., & Kanareff, Vera T. (U. Delaware) Information cost, amount of payoff, and level of aspiration as determinants of information seeking in decision making. *Behav. Sci.*, 1962, 7(4), 459-473.—S has to make a decision about a hypothetical patient in a mental hospital. A certain amount of information is given, but should he desire more he must "pay" for it. The average number of information-seeking queries do not appear to be consistent with an expected value maximization assumption or an instrumental conditioning model. Low information seekers spend more time in processing initial data and in making a decision—hardly consistent with the usual conception of a "confident" decision maker. (20 ref.)—*J. Arbit.*

6195. Sawyer, Jack, & MacRae, Duncan, Jr. (U. Chicago) Game theory and cumulative voting in Illinois: 1902-1954. *Amer. pol. Sci. Rev.*, 1962, 56, 936-946.—A symmetrical 3×3 zero-sum game theory model is devised for the behavior of the 2 district committees—1 Democratic, 1 Republican—each of which decides upon a strategy of entering 1, 2, or 3 candidates in the general election for representative to the Illinois General Assembly, in which 3 members are elected from each district. Decisions are made under uncertainty as to (a) what proportion of the vote the party will receive and (b) how many candidates the other party will enter; the model incorporates these uncertainties through probability and minimax principles, respectively, and prescribes strategies (varying with the expected vote) which optimize payoff—number elected. In 69% of the 1377 biennial elections from 1902 to 1954, each party employed its prescribed strategy; an additional 17% of the elections resulted in the prescribed outcome, even though at least one party departed from its prescribed strategy.—*Author abstract*.

6196. Schoeffler, Max S. (Bell Telephone Lab., Murray Hill, N. J.) **Prediction of some stochastic events: A regret equalization model.** *J. exp. Psychol.*, 1962, 64(6), 615-622.—"Subjects were instructed to ask for some number of 'make-believe dollars' MBDs or simply to guess a number which E would subsequently present. The payoff to S depended on the relation of S's bid to E's number. Three conditions were used to determine the payoff. In two of these, Ss were encouraged to bid high, but excessively high bids were punished. In the other condition, over- and underbids were treated symmetrically. A model was constructed which predicts the asymptotic bid level under these conditions to be at a point where the expected regret due to overbidding is equal to the expected regret due to underbidding."—*J. Arbit.*

6197. Strizenec, M. (Slovenskej Akad. Vied, Bratislava, Czechoslovakia) **K otázke využitia teórie informácie v psychológii.** [On the question of using the theory of information in psychology.] *Psychol. Stud.*, Bratislava, 1961, 3, 9-38.—A review of the fundamental knowledge of information theory and its application to psychology. Although there are dangers of excessive analogising and of taking a mechanistic approach to psychological problems in practical application, especially in the sphere of engineering psychology, many significant contributions are made. (Russian & English summaries)—*V. Břicháček.*

6198. Strizenec, M. (Slovenskej Akad. Vied, Bratislava, Czechoslovakia) **Výkon v diskriminativnej úlohe z hľadiska teórie informácie.** [The performance in a discriminative task from the viewpoint of the theory of information.] *Psychol. Stud.*, Bratislava, 1961, 3, 39-56.—With an increasing amount of information given in disjunctive reaction, the reaction time is prolonged and the number of errors increased by the amount of transmitted information is greater. More difficult discriminations were followed by a decreasing amount of transmitted information. The proportion of disjunctive reaction time to the logarithm of the number of alternative stimuli was verified. Practical consequences of the man-machine problem are quoted. (Russian & English summaries)—*V. Břicháček.*

6199. Thomas, P. E., & Kawahata, Aikoh. (Kirksville Coll. Osteopathy & Surgery) **Neural factors underlying variations in electrical resistance of apparently nonsweating skin.** *J. appl. Physiol.*, 1962, 17, 999-1002.—Comparisons were made in adjacent high- and low-resistance areas of sweat gland responses produced by intradermal injections of drugs that directly stimulate sweat glands. When procaine was used prior to such injection, the response was essentially the same in both areas. At moderate temperatures sweat glands evidently receive sudomotor impulses at a rate that does not produce visible sweating but does increase electrolyte conductance.—*D. R. Peryam.*

6200. van Naerssen, Robert F. **A scale for the measurement of subjective probability.** *Acta psychol.*, Amsterdam, 1962, 20(2), 159-166.—A scale for measuring subjective probability is described. The S chooses between a number of ordered pairs at the same time, thereby avoiding the time-consuming method of paired comparisons. The scale can be used

for modifying S motivation, in which case, amount of information is approximately a linear function of the score.—*G. Rubin-Rabson.*

PHYSIOLOGICAL PSYCHOLOGY

6201. Narikashvili, S. P. (Inst. Physiology, Tbilisi, USSR) **K voprosu o mekhanizmax uslovnoreflektornoi deiatel'nosti.** [Mechanisms of conditioning.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(4), 613-622.—On the basis of the latest data on the physiology of nonspecific structures of the brain, some assumptions are made on the possible origin of different phenomena of the conditioned activity. The significance of the reinforcement is regarded as an effect of excitation not only of certain specific projection systems but of the ascending reticular activating system as well. External inhibition is accomplished by means of activation of the reticular formation that blocks afferent impulses even at the subcortical level. Habituation is considered to be the result of a gradual weakening and cessation of the ascending activating influence of the reticular formation on the cortex. Temporary connections are presumed to be formed in the neocortex. The origin of the generalization and differentiation of conditioned reflexes is explained.—*A. Cuk.*

6202. Narikashvili, S. P. (Tbilisi, USSR) **Nekotorye obshchie voprosy fiziologii analizatorov v svete novykh dannykh o strukture i funktsii golovnogo mozga.** [Some general problems of the physiology of analyzers in light of new data on the structure and function of the brain.] *Vop. Psikh.*, 1962, No. 3, 56-72.—This is first a consideration of the role of the reticular formation in brain function attempting to show how this affects the function of the analyzer. Topics considered include the ascending activating function of the reticular formation and its role in the origin and conduction of affect impulses (including sensitization). Second, the role of the cortex in regulating the activity of the analyzer is discussed. This takes the form of habituation and is accomplished both through the reticular formation and via other sub cortical mechanisms. (108 item bibliogr.)—*H. Pick.*

NEUROANATOMY & PHYSIOLOGY

6203. Chusid, Joseph G., & Kopeloff, Lenore M. (New York State Psychiatric Inst.) **Epileptogenic effects of pure metals implanted in motor cortex of monkeys.** *J. appl. Physiol.*, 1962, 17, 697-700.—Induction of clinical epilepsy by precentral motor cortical implantation of pellets of 26 pure metals was evaluated in 40 monkeys. Nickel and antimony were most effective. Variable mild effects were noted with bismuth, cadmium, zirconium, tin, titanium, iron, molybdenum, mercury, vanadium, tungsten, and tantalum. Other metals were ineffective.—*D. R. Peryam.*

[Cholinergic mechanism of cortical activation.] *Fiziol. Zh. SSSR*, 1962, 48(10), 1141-1145.—Either electrical stimulation of the sciatic nerve or intravenous injection of amphetamine normally produce cortical activation (low voltage fast) in the EEG of rabbits. This response is blocked, however, by local application of a cholinergic in the parietal or striate areas.—*D. G. McDonald.*

LESIONS & BEHAVIOR

6210. **Aarons, Louis; Halasz, Hisako K., & Riesen, Austin H.** (Northwestern U.) Interocular transfer of visual intensity discrimination after ablation of striate cortex in dark-reared kittens. *J. comp. physiol. Psychol.*, 1963, 56(1), 196-199.—Assuming that the subcortical visual system mediates learning and interocular transfer of intensity discriminations in dark-reared cats, the authors predicted that habits would be retained after ablation of visual cortex and show complete transfer on tests with the previously unused eye. However, all 6 dark- and all 7 light-reared kittens lost monocularly trained habits postoperatively. After retraining with the initial eye, animals of both groups showed immediate interocular transfer, as did unoperated control Ss. It was concluded that with or without cortical participation, visual intensity (as opposed to pattern) discrimination habits are innately organized for interocular stimulus equivalence.—*Journal abstract.*

6211. **Affanni, J., Marchiafava, P. L., & Zernicki, B.** (Inst. Fisiologia, U. Pisa) Conditioning in the midpontine pretigeminal cat. *Arch. Ital. Biol.*, 1962, 100(3), 305-310.—"When in the midpontine pretigeminal preparation of the cat the visual stimulus (train of flashes) was repeatedly followed by hypothalamic stimulation producing pupillary dilation, after a number of trials the photic stimulus began to elicit the same pupillary reaction. At the beginning of the training this reaction was unstable but after several experimental sessions it became constant. This reaction is considered to be a true conditioned reflex and not a potentiation of the orientation reaction by hypothalamic stimulation (pseudo-conditioning)."—*C. T. Morgan.*

6212. **Affanni, J., Marchiafava, P. L., & Zernicki, B.** (Inst. Fisiologia, U. Pisa) Orientation reactions in the midpontine pretigeminal cat. *Arch. Ital. Biol.*, 1962, 100(3), 297-304.—"In the midpontine pretigeminal cat orientation reflexes to visual stimuli are present. They consist of vertical eye movements toward the stimulus, pupillary dilation and, in given conditions, EEG arousal. Habituation of the orientation reflex by repetition of the visual stimulus is easily obtained; the reflex partially recovers after a few minutes of rest. The midpontine pretigeminal cat is a convenient preparation for the study of the neural mechanisms underlying the orientation reflex."—*C. T. Morgan.*

6213. **Brown, Thomas S., Rosvold, H. Enger, & Mishkin, Mortimer.** (National Inst. Mental Health) Olfactory discrimination after temporal lobe lesions in monkeys. *J. comp. physiol. Psychol.*, 1963, 56(1), 190-195.—This study investigated the effects of bilateral superior and inferior temporal lobe lesions on the postoperative learning of olfactory and visual discrimination tests with both simultaneous and successive presentation of stimuli. The Ss were 3 rhesus monkeys with inferotemporal lesions, 3 with ablations of the anterior half of the superior temporal gyrus plus the temporal pole, and 2 unoperated controls. The inferotemporal group performed more poorly on the visual tests than the other 2 groups. On the simultaneous olfactory tests, no differences appeared; however, on the successive olfactory tests both operated groups were equally impaired when compared with the controls. Conclusions are: (a) the infero-

temporal cortex is the essential area for visual discrimination in the temporal lobe and (b) while no final statement can be made regarding a focal area serving discrimination in olfaction, it is clear that it must be different from the one serving discrimination in vision. (16 ref.)—*Journal abstract.*

6214. Brutkowski, S. (Nencki Inst. Experimental Biology, Warsaw, Poland) **The effect of prefrontal lobectomies on salivary conditioned reflexes in dogs.** *Acta Biol. exp., Warsaw*, 1957, 17(2), 327-337.—In dogs, in which conditioned salivary alimentary reflexes, both excitatory and inhibitory, are established, prefrontal lobectomies produce a pronounced impairment of inhibitory reflexes, whereas the excitatory reflexes are left unchanged. The degree and duration of impairment of inhibitory reflexes depends on the difficulty of the inhibitory task, the type of the nervous system of the dog, and the extent of lesion. The rate of restitution of inhibitory reflexes depends on factors enumerated. In some cases the disturbance of inhibition seems to be irreversible. The control ablations of similar extent in the parietal region do not produce this disorder.—*Journal abstract.*

6215. Brutkowski, S. (Nencki Inst. Experimental Biology, Warsaw, Poland) **Comparison of classical and instrumental alimentary conditioned reflexes following bilateral prefrontal lobectomies in dogs.** *Acta Biol. Exp., Warsaw*, 1959, 19, 291-299.—The effects of prefrontal lesions on the salivary and instrumental components of the alimentary conditioned reflexes were investigated both to excitatory and inhibitory conditioned stimuli as well as in intertrial intervals. It was found that postoperative disinhibition affects in nearly the same degree the salivary and motor conditioned reactions, and that they return simultaneously to normal after a lapse of time. There are some cases in which the salivary and motor reactions do not run parallel, the one of them or the other being disinhibited. The mechanism of these discrepancies is discussed.—*Journal abstract.*

6216. Brutkowski, S. (Nencki Inst. Experimental Biology, Warsaw, Poland) **Effects of prefrontal ablations on salivation during the alimentary unconditioned reflex and after its cessation.** *Acta Biol. Exper., Warsaw*, 1959, 19, 281-289.—“The present paper is concerned with the effects of removal of prefrontal lobes in dogs on the salivation during the alimentary unconditioned reflex (act of eating) and after its cessation. . . . [After] bilateral removal of the frontal lobes involving either gyrus preceus and gyrus orbitalis anterior, or encroaching also upon the anterior part of gyrus preceus, gyrus sigmoideus anterior and gyrus compositus anterior, the salivary secretion to the unconditioned stimuli, and in intertrial intervals, is augmented. This augmented salivation is chiefly due to the protraction of the act of eating, consisting in a very careful emptying of the bowl, licking it out and rummaging inside it, though the food is already eaten. The augmented unconditioned and intertrial salivation lasts about 7-14 days following the ablation, and amounts to about 125% of the preoperative level. . . . After parietal ablations no change in unconditioned and intertrial salivation is observed.” (31 ref.)—C. T. Morgan.

6217. Brutkowski, S. (Nencki Inst. Experimental Biology, Warsaw, Poland) **The solution of a difficult inhibitory task (alternation) by normal and**

prefrontal dogs. *Acta Biol. Exper., Warsaw*, 1959, 19, 301-312.—The “majority of normal dogs is able to master alternation with greater or lesser difficulty; however, there are some normal dogs which are not able to solve this test even after very prolonged training; in some dogs which were able to master this test this ability was totally and irreversibly lost after prefrontal ablations; some prefrontal dogs were able to solve this test; in one of these dogs the enlargement of the prefrontal lesion led to temporary abolishment of the alternation which was restored after about a month. The successful performance of the alternation test seems to depend on individual features of animals: the dogs belonging to the Pavlovian strong and balanced type are able to master alternation even after extensive prefrontal lesions; on the other hand, the dogs belonging to the unbalanced or weak type are not able to do so even without surgery. The ablation of prefrontal lobes does not change fundamentally the general typological properties of the dogs.”—C. T. Morgan.

6218. Forbes, Alexander, & Mahan, Clare. (Harvard U.) **Attempts to train the spinal cord.** *J. comp. physiol. Psychol.*, 1963, 56(1), 36-40.—In hope of comparing symmetrical trained and untrained centers in the spinal cord of the cat histologically, an attempt was made to establish linkage between afferent nerves from the tail and the flexor center on one side. Concurrent stimulation of the tail and hind foot in a spinal cat failed to establish linkage. Intact cats were trained to stop electric shocks to the tail by flexing the right hind leg, thus breaking the stimulating circuit. The results—variation in the voltage to tail required to cause flexion, increased threshold voltage on distraction, much greater latency of flexion to tail stimulus than in the flexion reflex, rise in threshold voltage under light etherization, complete absence of linkage after spinal transection—all showed that learning was in the brain, not in the spinal cord.—*Journal abstract.*

6219. Gavrilova, L. N. (Inst. Experimental Medicine, Leningrad, USSR) **Uslovyne refleksy s kozhnogo analizatora posle odnostoronnnego udaleniya talamusa.** [Cutaneous CR after unilateral ablation of the thalamus.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(4), 649-656.—Ss were 2 dogs in which parts of the tongue and ducts of the parotid glands were exposed. After the removal of the thalamus, the CRS to skin stimulation of both sides of the body disappeared if they had been elaborated on the basis of unconditioned acid stimulation of the part of the tongue on the side of the operation. Stimulation of the same parts of the skin produced CR if the acid reinforcement was applied to the intact side.—A. Cuk.

6220. Glickstein, M., Arora, H. A., & Sperry, R. W. (U. Washington) **Delayed-response performance following optic tract section, unilateral frontal lesion, and commissurotomy.** *J. comp. physiol. Psychol.*, 1963, 56(1), 11-18.—Serial operations were performed on 9 Macaca mulatta to transect optic tract on one side, to ablate one frontal area, and to transect the corpus callosum, psalterium and anterior commissure. Delayed-response performance in Ss with visual input ipsilateral to normal frontal area was superior to that in those with visual input contralateral to normal cortex. Subsequent commissurotomy virtually ended correct delayed-response performance in

Ss with contralateral lesions, but had far less effect on those with ipsilateral lesions. Hyperactivity was not correlated with impairment of delayed-response performance. Corticocortical connections between occipital and anterior frontal cortex via cortical association fibers are probably crucial for successful delayed-response performance. Moreover, interhemispheric connections are capable of sustaining psychological functions dependent on corticocortical connections. (18 ref.)—*Journal abstract*.

6221. Gomez, Juan A., & Mettler, Fred A. (Montefiore Hosp., NYC) Effect of bilateral anterior cingulate damage in cats. *J. Neurol. Neurosurg. Psychiat.*, 1962, 25(4), 387-391.—"In 18 adult cats the cingulate area was removed bilaterally and the animals were observed for at least 35 days. Twelve cats with ablation of the anterior third of the lateral gyri were used as controls. All animals were sacrificed and the brains were photographed, fixed, stained, and examined microscopically for anatomical reconstruction of the lesions. No gross behavioral disturbance and no specific neurological syndrome could be attributed to destruction of the cingulate area alone." (25 ref.)—*M. L. Simmel*.

6222. Gross, Charles G. (Massachusetts Inst. Technology) A comparison of the effects of partial and total lateral frontal lesions on test performance by monkeys. *J. comp. physiol. Psychol.*, 1963, 56(1), 41-47.—3 monkeys with sulcus principalis lesions (P group), 3 with lateral frontal lesions sparing sulcus principalis (NP group), 3 with total lateral frontal lesions (T group) and 3 unoperated Ss (U group) were compared on retention of simultaneous visual discrimination and acquisition of (a) delayed alternation, (b) auditory discrimination, (c) 2 successive visual discriminations, and (d) discrimination reversal. The groups did not differ on the visual tasks. On alternation both the P and T groups were severely impaired, the T group being poorer. On auditory discrimination only the T group was markedly impaired. Alternation results lend themselves to a focus-field description. Both focus-field and mass action descriptions are consistent with the auditory discrimination findings. (15 ref.)—*Journal abstract*

6223. Gross, Charles G. (Massachusetts Inst. Technology) Discrimination reversal after lateral frontal lesions in monkeys. *J. comp. physiol. Psychol.*, 1963, 56(1), 52-55.—Monkeys impaired on delayed response following midlateral frontal lesions, control operatees, and unoperated Ss were tested on 2 discrimination reversals. In Experiment 1 Ss were repeatedly tested for reversal of a discrimination within a session and retention of the same discrimination over 24 hr. Each reversal phase and each retention phase consisted of 30 trials. The frontal operatees made more errors than the other Ss in the reversal phases but not in the retention phases. In Experiment 2 Ss were trained to reverse a previously well-established visual habit. The groups overlapped on this task; each required a mean of over 100 trials to reach criterion. The results suggest that midlateral frontal lesions produce a discrimination deficit that is inversely related to the number of trials per problem. (16 ref.)—*Journal abstract*.

6224. Gross, Charles G. (Massachusetts Inst. Technology) Effect of deprivation on delayed response and delayed alternation performance by

normal and brain operated monkeys. *J. comp. physiol. Psychol.*, 1963, 56(1), 48-51.—3 monkeys impaired on delayed response and delayed alternation after midlateral frontal lesions, 3 monkeys unimpaired on these tasks after control lesions, and 3 unoperated monkeys were tested on spatial delayed response (with direct baiting) and spatial delayed alternation following 2, 26, and 50 hr. of food deprivation. Increased deprivation improved delayed response performance by all groups to a similar extent. Increased deprivation had no effect on delayed alternation performance by any group.—*Journal abstract*.

6225. Isaac, Walter, & Baker, E. Jo. (Emory U.) A changing effect of cortical ablation with age. *J. comp. physiol. Psychol.*, 1963, 56(1), 167-168.—The effect of a simultaneous bilateral ablation of the occipital cortex upon the formation of a conditioned avoidance response was investigated in rats at 2 age levels. A difference between operated and unoperated groups was found. An interaction between age and the operation was observed. Young-operated rats did more poorly than young-unoperated animals, while older-operated rats did better than older-unoperated animals.—*Journal abstract*.

6226. Kalinina, T. E. (Kirov Medical Inst., Gor'kii, USSR) Vlianie udaleniia slukhovoï i smezhnykh oblastei kory na zvukovye uslovnye refleksy. [Effect of the removal of the acoustic and adjacent cortical areas on auditory CR.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(4), 720-726.—CR to auditory stimuli were elaborated on 6 cats with a greater part of the neocortex preliminarily removed. It was found that Ss' ability of discriminating sounds by their pitch differs but little from that in normal ones. It was concluded that cortical areas adjacent to the acoustic ones do not substantially participate in the analysis of auditory stimuli.—*A. Cuk*.

6227. Kimble, Daniel Porter. (U. Michigan) The effect of bilateral hippocampal damage on cognitive and emotional behavior in the rat. *Disser. Abstr.*, 1962, 22(7), 2478-2479.—*Abstract*.

6228. Lawicka, W. (Nencki Inst. Experimental Biology, Warsaw, Poland) The effect of the prefrontal lobectomy on the vocal conditioned reflexes in dogs. *Acta Biol. exp., Warsaw*, 1957, 17(2), 317-325.—Vocal instrumental alimentary conditioned reflexes, both excitatory and inhibitory, were established in dogs in order to examine changes produced in them after prefrontal ablations. Excitatory vocal conditioned reflexes are slightly changed after operation in that the dog barks to the conditioned stimulus repeatedly in very quick succession. Inhibitory conditioned reflexes both to the experimental situation and to inhibitory stimuli are disinhibited. All these changes gradually disappear in the course of weeks or months.—*Journal abstract*.

6229. Lawicka, W., & Konorski, J. (Nencki Inst. Experimental Biology, Warsaw, Poland) Physiological mechanism of delayed reactions: III. The effects of prefrontal ablations on delayed reactions in dogs. *Acta Biol. Exper., Warsaw*, 1959, 19, 221-231.—"An investigation of the performance of dogs with limited prefrontal lesions (involving g. proneus and orbitalis) in the triple delayed-response test. . . . [Prefrontal] animals are able to go to the correct food-tray in the post-delay run only if they

have, throughout the delay period, preserved their bodily orientation towards that foodtray. If during this period the bodily orientation has been changed, they go, on release, to that foodtray to which they are immediately turned. The animals are able to learn to keep their bodily orientation unchanged during the delay periods, and thus their performance in the course of experimentation gradually improves. All those distracting stimuli which provoke a sufficiently strong orientation reaction to change the animal's posture inevitably disturb the post-delay reaction: after release, the animal runs in the direction which was imposed on him by the distracting stimulus."—C. T. Morgan.

6230. Pinto-Hamuy, Teresa; Santibañez-H, Guy, & Rojas, Aristides. (U. Chile) Learning and retention of a visual conditioned response in neocorticate rats. *J. comp. physiol. Psychol.*, 1963, 56 (1), 19-24.—This experiment is the 1st step undertaken to analyze the role of the cerebral cortex in avoidance behavior. A group of 20 normal and 2 groups of neocorticate rats were trained in an avoidance CR to a light signal. One group of neocorticate Ss was trained postoperatively (Group A, N=10) and the other pre- and postoperatively (Group B, N=20). In the latter, retention of the habit was also studied. Both groups of neocorticate Ss showed a serious deficit in the learning of the CR (visual) as compared with normal Ss. Preoperatively trained Ss appeared to perform better than Ss trained postoperatively. The deficit of the performance of neocorticate Ss in the CR are interpreted to be determined by the nature of the CS (visual) and by the nature of the CR (general motor response in free situation). (16 ref.)—*Journal abstract*.

6231. Saavedra, Maria A., Garcia, E., & Pinto-Hamuy, Teresa. (U. Chile) Acquisition of auditory conditioned responses in normal and neocorticate rats. *J. comp. physiol. Psychol.*, 1963, 56 (1), 31-35.—Inability of neocorticate rats to learn a visual avoidance CR raised the question of whether similar results would be obtained using an auditory CS. Ss of this experiment were 12 normal and 12 neocorticate rats. The results of "normals and operatees" were contrasted with the corresponding groups trained on a visual CR in a previous study. Neocorticate animals showed a deficit in the learning of the auditory avoidance CR ($p=.001$). In comparing both groups of neocorticates Ss trained on the auditory habit learned faster and reached a higher level of performance than those trained with the visual stimulus ($p=.05$). Factors which may account for this differential effect between CS modalities are described. (16 ref.)—*Journal abstract*.

6232. Saavedra, Maria A., & Pinto-Hamuy, Teresa. (U. Chile) Effects of removal of the anterior or posterior portions of the neocortex on learning and retention of a visual habit. *J. comp. physiol. Psychol.*, 1963, 56(1), 25-30.—Effects of removal of the rostral or occipital portions of the neocortex on acquisition and relearning of a visually conditioned response (VCR) were examined in 46 rats. Results indicate that: (a) Lesions in the anterior as well as in the posterior half of the neocortex produce a profound deficit on learning and relearning of VCRs. (b) The deficit in postoperative acquisition of VCRs is greater with the removal of the posterior

than of the anterior half of the hemisphere. The removal of the posterior half alone causes the animal to perform as if it were completely neocorticate. (c) There is no effect of previous experience on animals with rostral ablations of the neocortex. Rats with occipital removals relearn a VCR significantly better than animals without preoperative experience.—*Journal abstract*.

6233. Thompson, R. L., & Mettler, F. A. (Columbia U.) Permanent learning deficit associated with lesions in the caudate nuclei. *Amer. J. ment. Defic.*, 1963, 67(4), 526-535.—The effect of striatal lesions in a number of cats is described. Removal of about 75% of the heads of the caudate nuclei seemed to produce an incorrigible deficit in instrumental escape, avoidance, and food approach learning. Signs of neurologic deficit were virtually absent in one cat. Infringement upon adjacent brain structures was inevitable in attempting large extirpations. The authors state that the results are particularly important when it is recognized that in the absence of obvious sensory or motor incapacity, total and prolonged failure to learn has seldom been indicated in the literature on brain injuries in animals.—V. S. Sexton.

6234. Thompson, Robert, & Rich, Irene. (U. California, Los Angeles) Differential effects of posterior thalamic lesions of retention of various visual habits. *J. comp. physiol. Psychol.*, 1963, 56 (1), 60-65.—2 experiments are reported on the effects of pretectal diencephalic (nucleus-posterior thalami) lesions on retention of 3 different visual discrimination habits in rats. In Experiment 1 these lesions were found to have a significantly greater effect on a simultaneous brightness discrimination than on a simultaneous form discrimination. Increasing the difficulty of the brightness habit did not exaggerate the retention loss produced by such lesions. In Experiment 2 partial destruction of the nucleus posterior in rats lacking the striate cortex significantly interfered with the retention of a brightness discrimination. Partial damage to the superior colliculus, however, had no effect. (20 ref.)—*Journal abstract*.

6235. Vanderwolf, C. H. (McGill U., Canada) Medial thalamic functions in voluntary behaviour. *Canad. J. Psychol.*, 1962, 16(4), 318-330.—Following bilateral electrolytic destruction of the medial thalamic nuclei rats were virtually incapable of making rapid avoidance responses to electric shock, but could escape from shock as rapidly as a normal animal. There was little or no deficit in the acquisition of a conditioned fear. Avoidance responses were evident when sufficient time was given. It appears that what was impaired was the capacity to initiate a voluntary act.—R. S. Davidson.

6236. Young, J. Z. (University Coll., London, England) Repeated reversal of training in octopus. *Quart. J. exp. Psychol.*, 1962, 14(4), 206-222.—Octopuses were trained by successive presentations to discriminate between 2 figures by means of a combination of food rewards and electric shocks. This was followed by a series of up to 9 daily sets of trials in which reward and punishment were systematically reversed on alternate days. It was found that performance became progressively less accurate with successive reversals until it reached a random level; this appeared largely due to a continual fall in the total

number of attacks at the figures. At the same time, such attacks as were made were mainly at the positive figures and there was evidence that performance as judged by this criterion became more accurate during each day and perhaps progressively more accurate on successive days. Octopuses lacking the vertical lobe showed a fall in the total number of attacks but did not show this improvement within each day or over successive days. A theoretical interpretation of the results is put forward.—*Journal abstract.*

6237. Young, J. Z. (University Coll., London, England) **Reversal of learning in octopus and the effect of removal of the vertical lobe.** *Quart. J. exp. Psychol.*, 1962, 14(4), 193-205.—Experiments are described on reversal of learned response in the octopus. It is shown that normal animals are able to reverse learned responses to vertical and horizontal rectangles shown successively but that animals lacking vertical lobes are unable to reverse such a discrimination. These, and related results are discussed in relation to the hypothesis that learning consists in appropriate conditioning of cells in the optic lobes that respond to particular visual features but that the vertical lobe plays an important part in making the memory effective, perhaps by generalising the conditioning to optic lobe cells other than those directly stimulated in the process of learning.—*Journal abstract.*

BRAIN STIMULATION

Central Stimulation

6238. Travis, Robert P., Jr., & Sparks, David L. (U. Alabama) **The influence of unilateral and bilateral spreading depression during learning upon subsequent relearning.** *J. comp. physiol. Psychol.*, 1963, 56(1), 56-59.—An experiment was conducted to evaluate effects of prior avoidance training under varying degrees of spreading cortical depression (SD) on the subsequent performance of the nondepressed rat. All Ss met a criterion of 9 avoidance responses out of 10 trials during each of 3 experimental sessions. Conclusions are: (a) training without depression is superior to training with unilateral SD, which is superior to training with bilateral SD in facilitating subsequent performance with nondepressed Ss; (b) training with SD limited to one hemisphere is equally as effective as the same amount of training with SD alternated between the hemispheres in facilitating later nondepressed performance; (c) Ss receiving bilateral SD are incapable of avoidance learning but do improve in escape performance; and (d) there is negative transfer between extensive escape training received during bilateral SD and subsequent avoidance learning without SD.—*Journal abstract.*

Electroshock

6239. Williams, Gertrude J. (Washington U.) **The effect of varying the interval between conflict training and electroconvulsive shock on an instrumental conditioned emotional response.** *J. comp. physiol. Psychol.*, 1963, 56(1), 129-131.—115 male albino rats were randomly divided into a group which received no exposure to conflict and a group exposed to a conflict situation in which an instrumental conditioned emotional response (CER) was learned. Each group was subdivided into short and long interval treatment groups which received ECS or

pseudoshock 1 and 13 days, respectively, after training. After 4 days rest Ss were given 10 test trials, and magnitude of the CER was determined. Long and short interval ECS groups were significantly differentiated for the 1st 3 test trials. Comparisons of these groups with their pseudoshock controls indicate that ECS attenuated CER in the short interval group, whereas CER was minimally affected by ECS in the long interval group.—*Journal abstract.*

ELECTROENCEPHALOGRAPHY

6240. Boldyreva, G. N., & Rusinov, V. S. (Moscow, USSR) **Dinamika uslovnoreflektornykh izmenenii EEG pri mnogokratnykh sochetaniakh zvuka s ritmicheskimi svetovym razdrashitelem.** [Dynamics of conditioned changes in the EEG resulting from repeated combinations of a sound with a rhythmical light stimulus.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(6), 1011-1020.—A conditioned change-over of the human EEG (obtained on 11 Ss aged 18-35) as a result of combinations of a sound stimulus with a rhythmical photic stimulus showed a highly unstable and irregular character due to its rapid extinction. At the initial stages of elaboration the change-over is diffuse and relatively local. As the combinations are repeated, the change-over is recorded mainly in the centers of representation of the CS and US.—*A. Cuk.*

6241. Chapman, Robert M., Armington, John C., & Bragdon, Henry R. (Walter Reed Army Inst. Research, Washington, D. C.) **A quantitative survey of kappa and alpha EEG activity.** *EEG clin. Neurophysiol.*, 1962, 14, 858-868.—An electronic EEG scorer was used to quantify temporal kappa (temporal activity in 7-12 cps range) and occipital alpha EEG activities in 100 Ss while they were performing hard and easy tasks with their eyes open and closed. Distribution of kappa scores suggest quantitative rather than qualitative differences between Ss. Evidence supporting the distinction between kappa and alpha EEG activities was presented. Kappa was found to increase during hard tasks while alpha decreased and kappa was less affected by opening the eyes than was alpha. Simultaneous alpha and kappa scores indicated these were independent and occur simultaneously by chance.—*L. C. Johnson.*

6242. Kropfl, Walter J., Chapman, Robert M., & Armington, John C. (Walter Reed Army Inst. Research, Washington, D. C.) **Apparatus for scoring selected electroencephalographic rhythms.** *EEG clin. Neurophysiol.*, 1962, 14, 921-923.—"An electronic EEG scorer is described which automatically sums the time during which EEG activity of a preset frequency range is above a preset amplitude. Scores similar to the alpha index are obtained. Commercial modules and analog computer techniques make the device easy to build and reliable in performance. It has been found useful in studying the relation between selected EEG rhythms and behavior."—*L. C. Johnson.*

6243. Maritz, A. M. (Inst. Zoology, Moldavian Acad. Science, Kishinev) **Vliyehie goloda i nas'shcheniya na bioelektricheskuyu aktivnost' retikulyarnoi formatzii i kory bol'shikh polusharii golovnogo mozga.** [Effects of fasting and satiety on electrical activity of the reticular formation and cerebral cortex.] *Fiziol. Zh. SSSR*, 1962, 48(8),

889-892.—EEG changes in the cerebral cortex and brain stem reticular formation were observed in 3 dogs over a 48 hour period of starvation, which was followed by a period of satiation. After 1 day of starvation, the EEG of the alert animal showed long lasting periods of low voltage, asynchronous activity, mixed with short periods of high voltage, synchronous activity. After 2 days of starvation, only the low voltage activity was observed. 5 and 30 minutes after satiation, the normal EEG was observed. Auditory stimulation also produced a brief period of normal EEG activity in the starved animal, whereas low voltage activity appeared in the satiated animals.—D. G. McDonald.

6244. Minut-Sorokhtina, O. P., Sorokhtina, G. N., & Temper, YU. B. (Medical Inst., Khabarovsk) *Polyarizatsionnyi potentzial mozga pri umirani. [Polarization brain potential during dying.] Fiziol. Zh. SSSR*, 1962, 48(8), 893-898.—EEG changes in the cerebral cortex of 50 white mice were observed during dying. Onset of death was characterized by 2 phases in the EEG: (a) a sudden period of hyperpolarization, followed by (b) an equally sudden phase of depolarization. The phase of hyperpolarization was stereotyped and interpreted as a prodromal sign of necrosis, independent of the cause of death.—D. G. McDonald.

6245. Mirzoiants, N. S. (USSR Acad. Medical Sciences, Moscow) *Vozrastnye i individualnye razlichia funktsional'nogo sostoiianiia mozga detei rannego vozrasta po dannym elektroentsefalografii. [Age and individual differences in the functional state of the brain of infants according to EEG.] Zh. vyssh. nervn. Deiatel.*, 1962, 12(6), 1042-1048.—The EEG was recorded in 20 normal babies at age 15 days to 1½ yr. It was found that: (a) With age, the frequency and amplitude of the waves increase, and the rhythm becomes more pronounced. (b) EEG depends upon the functional condition of the brain, the more excitable the cortex, the more desynchronized the EEG appears to be.—A. Cuk.

6246. Mulholland, Thomas, & Runnals, Sylvia. (VA Hosp., Bedford, Mass.) *Evaluation of attention and alertness with a stimulus-brain feedback loop. EEG clin. Neurophysiol.*, 1962, 14, 847-852.—A simple feedback loop electronic apparatus was described by which selected EEG frequencies could cause a stimulus to occur. In this study the presence of alpha was used to trigger a stimulus, and when alpha was suppressed the stimulus was automatically removed. The results indicated that the on and off response of the stimulus reflected variation of the latency and duration of the alerting response. It was felt the technique could be usefully applied to the study of internal attention states.—L. C. Johnson.

6247. Mulholland, Thomas, & Runnals, Sylvia. (VA Hosp., Bedford Mass.) *Increased occurrence of EEG alpha during increased attention. J. Psychol.*, 1962, 54(2), 317-330.—The occurrence of EEG alpha during continuing attention-sets and during recurring alerting responses was compared. Alpha was frequently facilitated during periods of attention-sets and occasionally suppressed. However, the familiar suppression of alpha occasioned by alerting to an external signal was clearly evident. It was concluded that the classical alpha suppression-attention

correlation refers to a special case, i.e., transitory alerting to an external signal.—Author abstract.

6248. Pompeiano, O., & Swett, J. E. (Inst. Fisiologia, U. Pisa) *EEG and behavioral manifestations of sleep induced by cutaneous nerve stimulation in normal cats. Arch. Ital. Biol.*, 1962, 100(3), 311-319.—“Low rate stimulation of low threshold, cutaneous fibers induced synchronization of the EEG over the dorsal aspect of the cat's neo-cortex. The phenomenon was obtained in normal freely moving cats with implanted EEG and EMG recording electrodes and peripheral nerve stimulating electrodes. Induced EEG synchronization was sometimes also accompanied by behavioral sleep symptoms such as eye closure, reduction of tonic EMG activity, or both.”—C. T. Morgan.

6249. Pompeiano, O., & Swett, J. E. (Inst. Fisiologia, U. Pisa) *Identification of cutaneous and muscular afferent fibers producing EEG synchronization or arousal in normal cats. Arch. Ital. Biol.*, 1962, 100(3), 343-373.—“The different EEG effects obtained in normal unrestrained cats by stimulating pure cutaneous and muscular afferent fibers with different parameters of electrical stimulation were correlated with the conduction velocities of the corresponding nerve fibers, carried out in the same animal as a terminal experiment. The EEG synchronization induced by low frequency stimulation of the cutaneous nerves was obtained with stimulus intensities suprathreshold for group II fibers. Low frequency stimulation of group III cutaneous fibers, as well as high frequency stimulation of group II fibers, constantly evoked EEG and behavioral arousal.”—C. T. Morgan.

6250. Roth, B. (Karls U., Prague, Czechoslovakia) *Die chronische Insuffizienz des Vigilanz-Zustandes und ihre klinische und neurophysiologische Bedeutung: EEG-Studie. [Chronic insufficiency of alertness and its clinical and neurophysiological significance: Electroencephalographic study.] Psychiat. Neurol. med. Psychol., Leipzig*, 1962, 14(8), 293-300.—EEG rhythms, which were interpreted as signs of various depths of sleepiness, were found not only in a large series of patients with narcolepsy and hypersomnia, but also in over ½ of the cases of “neurasthenia,” “hysteria,” “autonomic nervous system dysfunction,” “pseudoneuroses,” and even in 10%-15% of normal controls. This leads to the conclusion that the failure of the unspecific activating systems to “raise the tonus of cortical activity” is important in the development of neurotic symptoms.—R. Kaelbling.

6251. Toporkova, L. A. (Medical Inst., Kuibyshev, USSR) *Izmeneniia bioelektricheskoi aktivnosti dvigatel'noi, zritel'noi i slukhovoï oblasti kory golovnogo mozga pri obrazovanii dykhatel'nykh refleksov. [Changes in bio-electrical activity of the motor, visual, and auditory areas of the cortex during respiratory conditioning.] Zh. vyssh. nervn. Deiatel.*, 1962, 12(4), 715-719.—EEG was recorded in 3 cats from the motor, visual, and auditory areas of the cortex during conditioning. 3 main phases of changes were found: desynchronization which coincides with the initial appearance of respiratory reflex, recruitment of stimulation rhythm which corresponds to the stabilization of the reflexes, and disappearance of changes in bio-electrical activity which reflects

the period of concentration of processes in narrowly limited cortical areas involved in temporary connection with the respiratory center.—*A. Cuk.*

EVOKED POTENTIALS

6252. Abrahams, V. C., Hilton, S. M., & Malcolm, J. L. (National Inst. Medical Research, Mill Hill, London, England) **Sensory connexions to the hypothalamus and midbrain, and their role in the reflex activation of the defence reaction.** *J. Physiol., London*, 1962, 164, 1-16.—In anaesthetized cats, cutaneous, auditory, and visual stimuli evoke potentials in widespread regions of the hypothalamus, central grey matter, and mid-brain tegmentum. These potentials have long latencies, are reduced by pentobarbitone, and survive removal of the cerebral cortex. Convergence of afferent pathways is indicated both within a single system and for different sensory systems. "Thus, the afferent connexions do exist which would enable these brain-stem regions to function as a reflex centre for the defence reaction."—*D. R. Peryam.*

6253. Anand, B. K., Chhina, G. S., & Singh, B. **Effect of glucose on the activity of hypothalamic "feeding centers."** *Science*, 1962, 138(Whole No. 3540), 597-598.—The unit activity of the neurons in the hypothalamic "satiety" and "feeding" centers and adjacent control regions was recorded before and after intravenous injection of glucose. Increase in blood glucose and arteriovenous glucose difference (glucose utilization) increases the activity of satiety center neurons and slightly decreases the activity of feeding center neurons, without producing any significant change in the activity of control regions.—*Journal abstract.*

Medical Sciences, Moscow, USSR) **Dinamika izmenenii vyzvannykh potentzialov v period protekaniya orientirovochhogo refleksa.** [Pattern of changes in evoked potentials within the course of an orienting reflex.] *Fiziol. Zh. SSSR*, 1962, 48(10), 1163-1169.—A rhythmic 2 per sec. light stimulus produced an evoked response in the EEG of dogs. The addition of a sound stimulus, which produced an orienting reflex, either augmented a low amplitude response to light or decreased a high amplitude response. Thereafter, as the sound ceased to evoke an orienting reflex, it ceased to influence the response to light.—*D. G. McDonald.*

6256. Sokolova, A. A. (N. N. Burdenko Inst. Neurosurgery, Moscow) **Issledovanie vyzvannykh potentzialov v EEG krolika v ovet na elektrokozhnoe razdrashenie v usloviyakh khronicheskogo eksperimenta.** [An investigation of evoked potentials in the EEG of the rabbit in response to electrical cutaneous stimulation in chronic experiments.] *Fiziol. Zh. SSSR*, 1962, 48(11), 1301-1310.—Evoked potentials in response to electrodermal stimulation were recorded from implanted sensorimotor electrodes in 5 rabbits. Several days after the electrodes were implanted the evoked response stabilized and was observed to be a consistent negative wave followed by a positive wave of lower voltage.

The response could be recorded from areas surrounding the sensorimotor area, although less clearly and less stable in form. The evoked potential in response to electrodermal stimulation could be distinguished from the evoked potentials following light stimulation. (52 ref.)—*D. G. McDonald.*

6257. Williams, Harold L., Tepas, Donald I., & Morlock, Henry C. (Walter Reed Army Inst. Research, Washington, D. C.) **Evoked responses to clicks and electroencephalographic stages of sleep in man.** *Science*, 1962, 138(Whole No. 3541), 685-686.—The form of the average evoked response to clicks is highly correlated with the background electroencephalogram. However, the response during the emergent low-voltage "dreaming" stage is different from that seen during the low voltage phase at the beginning of sleep. The results provide additional evidence that the emergent low-voltage stage is a neurophysiologically unique phase.—*Journal abstract.*

SENSORY PHYSIOLOGY

6258. Bartley, S. Howard, & Nelson, Thomas M. (Michigan State U.) **Some relations between sensory end results and neural activity in the optic pathway.** *J. Psychol.*, 1963, 55(1), 121-143.—Approaches to the study of visual sensation, especially brightness and flicker-fusion discrimination, are critically examined. The authors suggest that true explanation of a sensory phenomenon must describe an integrated sequence of physiological events starting with photochemical response to photic impingement and terminating with the cortical utilization of afferent input. Facts known about this process are organized using Bartley's "alternation of response theory" as a core.—*Author abstract.*

6259. Biersdorf, William R., & Granda, Allen M. (Walter Reed Army Inst. Research, Washington, D. C.) **Effects of stimulus duration upon spectral sensitivity of the human electroretinogram.** *J. Opt. Soc. Amer.*, 1962, 52(12), 1402-1406.—The effects of 3 stimulus durations on spectral sensitivity of the electroretinogram were examined under moderate light adaptation. The durations were 11, 42, and 109 msec. At a low criterion amplitude of response, the 11-msec. duration showed lower sensitivity in the green and blue regions of the spectrum than the 2 longer durations. At the red end of the spectrum all curves showed elevated sensitivity of approximately equal amounts. For a moderate criterion amplitude, the curves for the various durations retained their relative positions at the shorter wavelengths. At the red end of the spectrum, sensitivity decreased for all durations, but to a greater amount for the 2 longer durations. For a high criterion response, the 11-msec. duration became more sensitive throughout the spectrum; however, it retained a form similar to that for the 2 longer durations. The curves were presumed to include at least 2 components: a scotopic process and a red-sensitive process. Possible interpretations of the duration effects on the spectral curves included the Bunsen-Roscoe law and the summation of on- and off-responses.—*Journal abstract.*

6260. Brindley, G. S. (U. Cambridge, England) **Beats produced by simultaneous stimulation of the human eye with intermittent light and intermittent or alternating current.** *J. Physiol., London*, 1962, 164, 157-167.—Visible beats occur when light

frequency is 5-120 cps and electric current frequency differs by about 1 cps. The upper limit of light frequency to produce beats exceeds the flicker fusion frequency for comparable conditions, and that for electric current greatly exceeds the highest frequency which produces light or flicker in the unilluminated eye. Maximum interaction is obtained when the light precedes the electric current by 1-9 msec. "Photopic flicker fusion frequency is not limited simply by the photochemical mechanism of the cones or simply by the neural pathways of vision, but by attenuation of high frequencies in both these places in succession."—*D. R. Peryam.*

6261. Catton, W. T. (U. Durham, Newcastle-upon-Tyne, England) The effects of subliminal stimulation on the suitability of frog skin tactile receptors. *J. Physiol., London*, 1962, 164, 90-102.—Stimuli were brief (2-100 msec.) mechanical and electrical test pulses. A short stimulus caused first a sharp fall of threshold lasting 2-3 msec. followed by a period of subnormality up to 20 msec. Mechanical stimuli exceeding about 10 msec. duration gave transient excitability changes and enhanced excitability during the stimulus. Long electrical pulses produced changes resembling the familiar electronic effects in peripheral nerve. Cathodal stimuli simulated the effects of mechanical stimuli. Possible tactile receptor potential properties are discussed in connection with the known potentials of other mechanoreceptors.—*D. R. Peryam.*

6262. Clausen, Johs., & Karrer, Rathe. (Training School Vineland, N. J.) Comparison of phosphene threshold to various visual functions and to electrical sensitivity of the skin. *J. Psychol.*, 1963, 55(1), 91-99.—To verify that electrical and photic stimulation of the eye involve different processes, phosphene thresholds for 20 and 50 cps sine waves were correlated to absolute threshold for light, brightness discrimination, CFF, and phi phenomenon for 14 normal adult Ss. As expected, no significant correlations were found. Phosphene thresholds were also correlated with electrical cutaneous thresholds of the forearm, in an attempt to investigate the possibility that phosphene threshold is a general indicator of neural excitability. Again, no significant correlations were found, but because of the instability of the cutaneous threshold, this finding may not be reliable.—*Author abstract.*

6263. Evans, David R., & Mellon, DeForest, Jr. (Johns Hopkins U.) Stimulation of a primary taste receptor by salts. *J. gen. Physiol.*, 1962, 45, (4, Pt. 1), 651-661.—The repetitive response of the salt receptor cell of the blowfly taste receptor was studied quantitatively. Stimuli were salt solutions contained in the recording electrode which was placed over the tip of a sensory hair. Response begins at a high frequency and quickly declines to a steady frequency. The initial response was a sigmoid function of the log of stimulus intensity over a short range of intensities. Evidence is given that the salt-combining sites are anionic and strongly acidic and that the cation of a salt dominates stimulation.—*D. R. Peryam.*

6264. Halpern, Bruce P., Bernard, Rudy A., & Kare, Morely R. (Cornell U.) Amino acids as gustatory stimuli in the rat. *J. gen. Physiol.*, 1962, 45(4, Pt. 1), 681-701.—Neural activity in the intact chorda tympani, measured with an electronic sum-

mator, increased when amino acid solutions 0.01 moles per liter or above passed over the tongue. Order of response magnitude is given for a number of amino acids. Maximum response developed in 1-3 minutes and was followed by a sustained depression of response to NaCl. Amino acids vs. water preferences were investigated, and effects are discussed. It is concluded that glycine and analine receptor effects differ from those of NaCl but that all may affect a common site. Prior exposure to amino acids may modify subsequent neural and behavioral responses.—*D. R. Peryam.*

6265. Harrison, J. M., Warr, W. B., & Irving, R. E. Second order neurons in the acoustic nerve. *Science*, 1962, 138(Whole No. 3543), 893-895.—In silver-stained preparations of the rat auditory system large neurons were distributed over the whole length of the acoustic nerve. These neurons received many synaptic endings which arose from collaterals of the acoustic fibers. The axons of the neurons ascended toward the cochlear nuclei. Similar neurons were found in the mouse, but not in the bat or cat.—*Journal abstract.*

6266. Hawkes, Glenn R. (USA Medical Research Lab., Ft. Knox, Ky.) Effect of skin temperature on absolute threshold for electrical current. *J. appl. Physiol.*, 1962, 17, 110-112.—Maximal cutaneous sensitivity for pressure or mechanical vibration occurs at about 36° C. and shifting in either direction raises the RL. In the present study, raising skin temperature of finger or forearm even to 45° C. had no effect on the RL for electrical stimulation. "It is concluded that the dependence of sensitivity to pressure or mechanical vibration on skin temperature is a peripheral effect." The electrical current apparently affects nerves directly without transduction by any process at the receptor.—*D. R. Peryam.*

6267. Simmons, F. Blair, & Beatty, Dana L. (Stanford U.) A theory of middle ear muscle function at moderate sound levels. *Science*, 1962, 138(Whole No. 3540), 590-591.—The minor amplitude modulations of auditory input, which are introduced by the middle ear muscle acoustic reflex at moderate and low sound intensities in the cat, may contribute significantly to signal analysis or attention mechanisms of the auditory system.—*Journal abstract.*

ENDOCRINE, BIOCHEMICAL, & CIRCULATORY EFFECTS

6268. Amiragova, M. G. (Inst. Normal & Pathological Physiology, Acad. Medical Sciences, USSR) Rol' retikulyarnoi formatsii mozgovogo stvola v peredache vliyanii tsentral'noi nervnoi sistemy na schitovidnuyu zhelezu. [The role of the reticular formation of the brain stem in the transfer of influence of the central nervous system on the thyroid gland.] *Dokl. Akad. Nauk SSSR*, 1962, 147(1), 252-254.—This study investigated the effect of amazin on the thyroid gland of dogs. The activity of the thyroid gland was indexed by change of content of radioactive iodine. The dosage of iodine was 0.5 μ Cu/Kg of weight and amazin was 1-1.5 mg. Kg of weight introduced 40-60 min. before beginning of the experiment. A conditioned motor response to a metrinome with UCS as electric shock was elaborated to assay the functional state of the nervous system. The thyroid gland separates out the iodine in response to stimulation by the UCS. This reaction reaches a

maximum 1.5-2 hr. after the termination of the shock and in about 3-3.5 hr. the gland is back to normal. Amazin had no effect on the functioning of the thyroid gland in the normal life of the animal. However, under the influence of amazin the CR activity disappeared completely or was greatly reduced although the response to the UCS was preserved. It is concluded that the reticular formation plays an important role in the regulation of the thyroid gland by the CNS.—H. Pick.

6269. Briggs, Michael H., & Kitto, G. Barrie. The molecular basis of memory and learning. *Psychol. Rev.*, 1962, 69(6), 537-541.—The "nucleotide rearrangement hypothesis of memory postulates undemonstrated properties of nucleic acids that seem incompatible with current knowledge, while the hypothesis fails to give any satisfactory account of how RNA-stored information could influence the nervous mechanisms of memory. The experimental evidence produced in favor of this hypothesis is equally compatible with the hypothesis that memory is basically dependent upon neurone pathways maintained by high levels of transmitter substances due to induced biosynthetic enzymes."—C. T. Morgan.

6270. Corah, Norman L., & Stern, John A. (Washington U. School Medicine) Stability and adaptation of some measures of electrodermal activity in children. *J. exp. Psychol.*, 1963, 65(1), 80-85.—Measures of electrodermal activity in children, skin resistance levels, and spontaneous fluctuations, made during rest and during tone stimulation were related to each other and to the conditions under which they were obtained. The results indicate that the resting measures are fairly reliable over time although they both showed the effects of adaptation, and they are influenced by the amount and type of prior activity. These measures showed significant but low relationships with each other. Orienting responses to tone stimulation tended to show the effects of adaptation from stimulation in a previous session.—*Journal abstract.*

6271. England, Samuel J. M., & Pasamanick, Benjamin. (Columbus Psychiatric Inst. & Hosp.) A discussion of chronogeometry as related to non-stationary time series such as the physiological electrogram. *J. Psychol.*, 1962, 54(2), 453-465.—Electrogram traces of repetitive physiological phenomena, as for example heartbeat and respiration, may be recorded one above the other. A logical basis for this method is discussed and its possible usefulness in the analysis of physiological time series is illustrated. The theory of objects is suggested as finding application in this method of examining the physiological time series. The concept of rigid time-systems is advanced as having similarities in analysis to that of rigid bodies of classical physical theory.—*Author abstract.*

6272. Fisher, A. E., & Coury, J. N. Cholinergic tracing of a central neural circuit underlying the thirst drive. *Science*, 1962, 138(Whole No. 3541), 691-693.—Cholinergic stimulation of any of a number of interrelated limbic and diencephalic structures in the rat elicits a rapid and marked increase in water intake. We postulate that a generalized Papez circuit is specifically and functionally sensitive to cholinergic action, and that other primary drives depend on

closely parallel neural circuits partitioned both structurally and biochemically.—*Journal abstract.*

6273. Gerall, Arnold A. (U. Kansas) The effect of prenatal and postnatal injections of testosterone propionate on prepubertal male guinea pig sexual behavior. *J. comp. physiol. Psychol.*, 1963, 56(1), 92-95.—An attempt was made to induce sexual precocity in male guinea pigs by prenatal and postnatal injections of testosterone propionate. Experimental groups were: (a) oil injected controls, (b) injected daily postnatally with testosterone propionate, (c) treated by injecting mothers from the 10th day of pregnancy until parturition with testosterone propionate, (d) both pre- and postnatally treated. 3 or 4 mating tests were given each week to 27 Ss starting 9-12 days after birth and to 9 Ss starting 20 days after birth. Postnatally treated Ss exhibited intromission and ejaculation 3-6 days earlier and mounting approximately 15 days earlier than oil injected controls. Prenatal administration of testosterone propionate alone did not advance the appearance of sexual responses. Less sexual precocity was produced than is reported for androgen-treated rats.—*Journal abstract.*

6274. Moyer, K. E., & Moshein, Peter. (Carnegie Inst. Technology) Effect of adrenalectomy on the attenuation of a conditioned avoidance response by ECS in the rat. *J. comp. physiol. Psychol.*, 1963, 56(1), 163-166.—Hypothesis: Adrenal glands are essential for ECS to attenuate a conditioned avoidance response. 60 rats were divided into 3 groups of 20 each: bilateral adrenalectomy, sham-operated, control. Each of these was divided into ECS and pseudo-ECS. After surgery each S was trained in a shuttle alley to a criterion of 20 consecutive avoidances. Ss were then given either 21 ECS or pseudo-ECS treatments over 11 days. The dependent variable was the number of avoidances made on a test day 24 hr. after the last ECS of pseudo-ECS treatment. The results showed that ECS significantly attenuated the conditioned avoidance response in intact, sham-operated, and adrenalectomized rats. It was concluded that the adrenals are not necessary for ECS to attenuate an avoidance response.—*Journal abstract.*

6275. Rodionov, I. M. (Inst. Therapeutics, Moscow) Sosudorasshiritel'nye reaktzii, voznikayushchie pri razlichnykh sostoyaniyakh sosudistoĭ periferii. [Vasodilatation responses occurring during different conditions of the peripheral vessels.] *Fiziol. Zh. SSSR*, 1962, 48(11), 1342-1349.—Body temperatures of cats were lowered to 33°-28° C. In this condition of hypothermia, stimulation of the animal produced peripheral vasodilatation, instead of the usual vasoconstriction. Vasodilatation did not occur, however, after injection of atropine. Injection of dihydroergotamine, a vasoconstrictor, did not block the vasodilatation. The presumed neural bases underlying the change in character of the vasomotor response are discussed.—D. G. McDonald.

6276. Severová, M. (Charles U. Prague, Czechoslovakia) Změny základní kožní vodivosti při reprodukci situací a činností. [Changes in the basic skin conductance while reproducing situations and activities.] *Českoslov. Psychol.*, 1962, 6, 25-35.—Mean values of the basic skin conductance in various experimental situations show a gradual decline the

greater or lower the difference which corresponds to the complexity and psychological significance of experimental situations. Basic skin conductance is recommended as a method for controlling the activation level of Ss as a measure of significance or complexity of experimental situations and also as indicator of the process of adaptation to it. (Russian & English summaries)—*V. Břicháček*.

6277. Smith, C. E. Is memory a matter of enzyme induction? *Science*, 1962, 138 (Whole No. 3543), 889.—Variations in cholinesterase and RNA concentrations and in levels of neural activity have been linked to learning. These 3 groups of experimental evidence suggest that the basis of memory lies in an increase of the concentrations of enzymes associated with transmitter substances, as a long-lasting effect of stimulation. Biological precedent exists in microbial physiology.—*Journal abstract*.

6278. Stroebel, Charles Frederick. (U. Minnesota) Differential effects of adrenal demedullation on acquisition and extinction of a passive avoidance (punishment) and a conditioned emotional response in the albino rat. *Dissert. Abstr.*, 1962, 22(11), 4101.—*Abstract*.

6279. Van Derhoof, Ellen, & Clancy, John. (State U. Iowa) Peripheral blood flow as an indicator of emotional reaction. *J. appl. Physiol.*, 1962, 17, 67-70.—Flow was measured plethysmographically while Ss were exposed to varied stresses, including abreaction of some prior traumatic event and exposure to new stresses in both awake and hypnotic states. The former caused an increase in mean flow for all Ss. The initial response to new stresses was increased flow, but repetition of the stress extinguished the response. Results are interpreted in terms of personality functioning. It is concluded that peripheral blood flow is a sensitive indicator of emotional reactivity.—*D. R. Peryam*.

PSYCHOPHARMACOLOGY

6280. Bindra, Dalbir, & Mendelson, Joseph. (McGill U.) Training, drive level, and drug effects: A temporal analysis of their combined influence of behavior. *J. comp. physiol. Psychol.*, 1963, 56(1), 183-189.—Effects of these variables on 4 time measures describing the essential or relevant components of a water-reinforced lever-pressing response, as well as on the time spent in irrelevant activities (grooming, sniffing, and sitting) were studied in 44 rats. Chlorpromazine decreased response rate at the 2 higher levels of training but not at the lowest level; methylphenidate decreased rate at the 2 lower drive levels but not at the highest. The response decrements were associated with a decrease in the speed of the relevant components in the case of chlorpromazine, and with an increase in time spent in irrelevant activities in the case of methylphenidate. A tentative generalization about the basis of differential effects of stimulant and depressant drugs on behavior is suggested.—*Journal abstract*.

6282. Carpenter, John A., Moore, Omar K., Snyder, Charles R., & Lisansky, Edith S. Alcohol

and higher-order problem solving. *Quart. J. Stud. Alcohol*, 1961, 22(2), 183-222.—64 male medical students were trained in the calculus method, a mathematical logic, which was the experimental task. Problem solving efficiency then was studied in relation to varying dosages of alcohol (0.0, 0.33, 0.67, and 1.0 ml. of absolute alcohol per kg.). Analysis of variance on blood alcohol levels and 9 problem-solving measures revealed that efficiency was a curvilinear function of doses. A moderate amount of alcohol (the 0.33 ml. per kg. dose) was related to an increase in efficiency whereas the largest dose (the 1.0 ml. per kg. dose) proved quite detrimental to efficiency. Certain measures relevant to the approach taken to the solution of problems were complexly related to doses; and this matter is discussed.—*D. E. Walton*.

6285. Colquhoun, W. P. Effets d'une faible dose d'alcool et de certains autres facteurs sur la performance dans une tâche de vigilance. [Effects of a small dosage of alcohol and other factors on the performance of a task requiring visual vigilance.] *Bull. Cent. Etud. Rech. Psychotech.*, 1962, 11(1), 27-44.—It was found that the time of day at which the test session was held and the temperamental characteristics of individual Ss influenced the detection efficiency. The effects of time of day persisted when task speed was varied under paced conditions of work. "The relationship between temperament and efficiency was undisturbed by a change in the difficulty of the discrimination required to detect a signal, or by an alteration in the speed of pacing (it was obscured, however, when the task was unpaced)." The practical importance of the findings for the organization of monitoring work is discussed.—*V. Sanua*.

6286. Evans, Wayne O. (USA Medical Research Lab., Ft. Knox, Ky.) The synergism of autonomic drugs on opiate or opioid-induced analgesia: A discussion of its potential utility and an annotated bibliography. *USA Med. Res. Lab. Rep.*, 1962, No. 554. ii, 26 p.—A diverse group of autonomically active drugs has been shown to potentiate an opiate-induced analgesia. Of these drugs, a d-amphetamine-opiate mixture offers an increase in analgetic effects of 60%-100%, while minimizing the side effects of the opiate. The potential of this combination for use when traumatic injury occurs in situations in which shock is a particular difficulty is discussed. An annotated bibliography is presented on the potentiation of opiate-induced analgesia by autonomic drugs.—*USA MRL*.

6287. Evans, Wayne O., & Caldwell, Lee S. (USA Medical Research Lab., Ft. Knox, Ky.) The effects of the potassium and magnesium salts of dl-aspartic acid on human fatigue and recovery. *USA Med. Res. Lab. Rep.*, 1962, No. 550. ii, 5 p.—The magnesium and potassium salts of dl-aspartic

acid were tested for anti-fatigue effects on highly motivated human Ss using an arm dynamometer. No change in either initial performance or performance after a 5-hour rest could be attributed to drug action. However, all Ss stated that they felt better after aspartates as compared with placebos.—*USA MRL*.

6288. Fiddleman, Paul Barry. (U. North Carolina) The prediction of behavior under lysergic acid diethylamide (LSD). *Dissert. Abstr.*, 1962, 22 (8), 2873-2874.—*Abstract*.

6289. Hearst, Eliot, & Whalen, Richard E. (National Inst. Mental Health, Washington, D. C.) Facilitating effects of D-amphetamine on discriminated-avoidance performance. *J. comp. physiol. Psychol.*, 1963, 56(1), 124-128.—Effects of elimination of the opportunity to escape and pretreatment with 3 mg/kg of d-amphetamine were separately examined in rats which exhibited relatively poor performance in a discriminated avoidance-escape situation. Removal of escape opportunity led to marked deterioration in avoidance performance, which could be reversed by reinstatement of the escape contingency. Administration of d-amphetamine brought about a significant improvement in avoidance performance without affecting lever responding in non-CS periods. D-amphetamine was also found not to affect responding to exteroceptive stimuli that had not previously been correlated with shock. An interpretation which emphasizes breakup of CS-induced freezing patterns by d-amphetamine appears the most logical of several possible explanations for the drug's effects.—*Journal abstract*.

6290. Herrnstein, R. J. (Harvard U.) Placebo effect in the rat. *Science*, 1962, 138(Whole No. 3541), 677-678.—Scopolamine hydrobromide disrupts the learned behavior of rats in a predictable manner. Physiological saline mimics to some extent the effect of the drug when the 2 substances are alternately administered in a series of injections. This placebo effect appears to be an instance of simple Pavlovian conditioning.—*Journal abstract*.

6291. Hughes, Francis W., Forney, Robert B., & Gates, Paul W. (Indiana U. School Medicine) Performance in human subjects under delayed auditory feedback after alcohol, a tranquilizer (benzquinamide) or benzquinamide-alcohol combination. *J. Psychol.*, 1963, 55(1), 25-32.—A delayed auditory return system was utilized to induce anxiety in 16 volunteers. 9 verbal tests were performed, recorded and graded. Each S performed the series of tests on 4 occasions. He had the following 4 treatments: (a) benzquinamide plus alcohol, (b) placebo drug plus alcohol, (c) benzquinamide plus placebo alcohol, and (d) placebo drug plus placebo alcohol. It was found that benzquinamide increased performance while under this self-induced anxiety stimulus, alcohol effected a deficiency in performance in low concentrations and synergism of this tranquilizer and alcohol was not evident. This method is suggested for the quantitative evaluation of tranquilizers in humans as well as the estimation of synergistic action of alcohol on tranquilizers.—*Author abstract*.

6292. Lester, David. (Yale U.) Self-maintenance of intoxication. *Quart. J. Stud. Alcohol*, 1961, 22(2), 223-231.—In some studies utilizing 9

rats it was shown that drinking of a 5.6% alcohol solution could be maintained, and that the attendant behavior appeared compulsive in character. 1 rat maintained itself at blood alcohol levels of 0.11 to 0.19% for a period of 70 hours. The method offers "a simple approach to the study of the development of metabolic and functional tolerance for alcohol and other effects of prolonged intoxication, such as the withdrawal syndrome."—*D. E. Walton*.

6293. Pawlowski, A. A., Denenberg, V. H., & Zarrow, M. X. (Purdue U.) Prolonged alcohol consumption in the rat: II. Acquisition and extinction of an escape response. *Quart. J. Stud. Alcohol*, 1961, 22(2), 232-240.—The effects of prolonged alcohol consumption in rats was studied in terms of the acquisition and extinction of a learned escape response using shock reinforcement. The alcohol and control groups were similar in the rate of learning and relearning. Alcohol treated rats showed a reduction in the strength of learned fear responses as manifested by significantly longer running times during the performance phase and by a more rapid extinction of the escape route. "These findings are in complete opposition to previously reported data on the effects of prolonged alcohol consumption upon a barpressing response using food reward . . . thereby demonstrating a major interplay between prolonged alcohol consumption and the nature of the reinforcement employed."—*D. E. Walton*.

6294. Rinkel, Max. (Ed.) Specific and non-specific factors in psychopharmacology. New York: Philosophical Library, 1963. 174 p. \$3.75.—Proceedings of a symposium held at the 3rd World Congress of Psychiatry in Montreal, Canada, June 4-10, 1961. The major paper in this volume is "Some Specific Effects of Psychoactive Drugs" by Harold E. Himwich. Other papers are: A Quantitative Approach to Psychopharmacology" (H. K. Beecher), "Test Score Instability: A Source of Error in Individual Drug Response" (D. A. Knight), "Relation of Drug-Induced Changes to Personality" (L. La-sagna), "Personality and Drugs: 'Specific' and 'Non-Specific' Influences on Drug Actions" (A. DiMascio & Rinkel), "Variables and Drug Effectiveness" (S. Malitz), "Non-Drug Parameters of Psychopharmacology: The Role of the Physician" (P. E. Feldman), and "Individual Animal Variation in the Effects of Pentobarbital and Dextro-Amphetamine: A Comparison" (C. Kornetsky, J. Dawson, & E. Pelikan). There are discussions by H. Hoaglund and H. Kulver.—*C. T. Morgan*.

6295. Schmidt, H., Jr., & Dry, L. (Washington U. School Medicine) Comparison of phenobarbital and pentobarbital actions upon water ingestion. *J. comp. physiol. Psychol.*, 1963, 56(1), 179-182.—Differences in magnitude of facilitation of drinking by drugs suggested they have differing actions. To confirm this hypothesis, 18 rats in water balance were injected with phenobarbital, pentobarbital, or control solution ½ hr. before being given hypertonic saline to induce drinking. They were allowed to drink immediately. Phenobarbital reduced response latency and increased drinking; pentobarbital had no effect upon either measure. The Ss were then given pentobarbital or the control solution 5 hr. after saline administration and ½ hr. before having access to water. Pentobarbital then increased drinking well above con-

trol level. Conclusions are: (a) phenobarbital and pentobarbital differ in their action upon water ingestion; (b) phenobarbital, despite reduction of response latency, is not an adequate stimulus for drinking; (c) delay between saline administration and drinking introduces some condition not immediately elicited but not reflected in the volume ingested by comparable controls.—*Journal abstract.*

6296. Solomon, Richard L., & Turner, Lucille H. Discriminative classical conditioning in dogs paralyzed by curare can later control discriminative avoidance responses in the normal state. *Psychol. Rev.*, 1962, 69(3), 202-218.—“Dogs were trained to avoid shock in response to a signal. . . . After the dogs were reliably pressing the panel in response to the signal, with response latencies of 3 seconds or shorter, they were totally paralyzed by curarization. While the dogs were thus completely immobilized under curare, a Pavlovian discriminative conditioning session was carried out. . . . After this conditioning session, the dogs were given 48 hours in which to recover from the various physiological side effects of curarization. Next they were returned to the training situation in the normal, undrugged state, and the three previously used stimuli (S^0 , S^+ , and S^-) were presented. . . . The dogs responded in a way consistent with their discriminative Pavlovian conditioning experience under curare. . . . This experiment demonstrates that certain types of transfer of training or problem solving can occur without the benefit of mediation by peripheral skeletal responses or their associated feedback mechanisms.”—C. T. Morgan.

ENVIRONMENTAL EFFECTS

6298. Davis, T. R. A. (USA Medical Research Lab., Ft. Knox, Ky.) Effect of heat acclimatization on artificial and natural cold acclimatization in man. *J. appl. Physiol.*, 1962, 17, 751-753.—Seasonal changes in oxygen consumption, rectal temperature, and skin temperature in response to 1-hr. exposure to 14.1 C. were measured monthly between October and February for 6 Ss, and for another group nude-exposed in a chamber 8 hr. daily at 13.5 C. Shivering and heat production decreased significantly in both groups. Skin and rectal temperatures fell for the chamber group but not for the seasonal group. Then both groups were subjected to 21 days of heat acclimatization followed by another cold-response measurement. The changes induced by the original exposure were not influenced by heat exposure in either group.—D. R. Peryam.

6299. Essman, Walter B., & Sudak, Frederick N. (Albert Einstein Coll. Medicine, N. Y.) Effect of body temperature reduction on response acquisition in mice. *J. appl. Physiol.*, 1962, 17, 113-116.—“In four experiments . . . mice were treated with either 2, 4-dichlorophenoxyacetic acid or saline in combination with cold exposure. In a four-trial water-escape problem, normothermic animals acquired the response but hypothermic mice did not show learning. A temperature-dependent relationship to learning was demonstrated.”—D. R. Peryam.

6300. LeBlanc, Jaques. (Laval U., Quebec City, Canada) Local adaptation to cold of Gaspé fishermen. *J. appl. Physiol.*, 1962, 17, 950-952.—Gaspé fishermen have a general adaptation to cold, as shown by the fact that immersion of the hands and feet in ice water gave lower pressor responses than for a control group. This adaptation is maintained throughout the year. Immersion of the hands in hot water revealed no difference between fishermen and controls. Thermoreceptors, hypothalamus, cortex, and effector organs are suggested as sites of the adaptation.—D. R. Peryam.

6301. Sudak, Frederick N., & Essman, Walter B. (Albert Einstein Coll. Medicine) Maze acquisition and retention in hypothermic mice. *J. appl. Physiol.*, 1962, 17, 747-750.—Animals made hypothermic (about 3.3 C. colonic) by treatment with 2,4-dichlorophenoxyacetic acid and exposure to cold air (2.0 C.) did not acquire a simple escape response from a water maze in 10 trials, as compared with 4 trials for saline-treated controls. Retention was a function of acquisition during training. Retention and performance were not affected by a comparable reduction in colonic temperature.—D. R. Peryam.

Radiation

6302. McDowell, A. A., & Brown, W. Lynn. (U. Texas) Sex and radiation as factors in learning performance by rhesus monkeys on a series of dot discrimination problems. *J. genet. Psychol.*, 1962, 101(2), 273-278.—40 male and 24 female rhesus monkeys, ranging in age from 36 to 48 months, with previous exposure to varying dosages of nuclear radiation, were tested on a series of 5 dot-discrimination problems presented in order of decreasing size of the dot. Statistical analysis of the error data, using a nonorthogonal analysis of variance design, yielded the following results: (a) errors increased significantly as the diameter of the black dot was decreased, (b) the radiation by problems interaction was significant as a reflection of the fact that the higher the relative radiation dosage the fewer the errors as the diameter of the black dot decreased beyond the 3rd problem, and (c) the sex by problems interaction was significant with the increases in errors on problems 4 and 5 being greater for the male Ss than for the female Ss.—*Author abstract.*

Stress

NUTRITION

6303. Brozek, Josef. (Lehigh U., Bethlehem, Pa.) Soviet studies on nutrition and higher nervous activity. *Ann. N. Y. Acad. Sci.*, 1962, 93, 665-714.—A critical review of Soviet studies on the relations among conditioned responses, nutritional status, and higher nervous system function. Methodological problems include too great reliance on CR techniques and animal experimentation. Soviet and American studies on chronic and acute semistarvation and on Vitamin A are contrasted. Vitamin B complex constituents deficiencies produce increased inhibition, but effects seem related to the type of nervous system. Cortical excitability correlates positively with protein intake. The effects of a variety of amino acids and other diet-related factors are considered. The relation of nutrition to neural biochemistry is also noted. (96 ref.)—B. S. Aaronson.

6304. Louttit, Richard Talcott. (U. Michigan) Effect of phenylalanine and marplan feeding on brain serotonin and learning behavior in the rat. *Dissert. Abstr.*, 1962, 22(7), 2479-2480.—Abstract.

6305. Sinha, S. N. (Patna, India) Metabolic deficiency and behaviour pathology. *Indian J. Psychol.*, 1962, 37(1), 17-22.—This is a review of selected studies concerning food deprivation and dietary deficiency on behavior. The 8 references cited were published during 1936-48.—J. T. Cowles.

GENETICS & BEHAVIOR

6306. Luria, A. R. (Moscow, USSR) Ob izmenchivosti psikhicheskikh funktsii v protsesse razvitiya rebenka: Na materiale sravnitel'noe issledovaniya bliznetsov. [On the variability of mental functions in the process of the development of a child: On material from a comparative investigation of twins.] *Vop. Psikhol.*, 1962, No. 3, 15-22.—A method of comparison of identical and fraternal twins is advocated for evaluation of the relative contribution of heredity and environment. Data on physical characteristics gathered by another investigator are compared with data on memory processes gathered by the present investigator. The physical indices and indices of immediate visual memory show a greater degree of variability for the fraternal twins than for the identical. This difference is not dependent on the age of the twins. However, indices of immediate verbal memory and mediated verbal memory show larger initial variability between fraternal than identical twins but this difference decreases with the age of the twins. These results are interpreted as showing the influence of environment on complex functions in contrast to elementary functions.—H. Pick.

6307. Mogensen, Alan, & Juel-Nielsen, Niels. (Aarhus State Hosp., Risskov, Denmark) Factors influencing preference rankings in a special picture test and in Lüscher's colour test: A study of uniovular twins brought up apart. *Acta psychiat. Scand.*, 1962, 38(3), 208-212.—"The preference rankings of items in an experimental picture test and in Lüscher's colour test were investigated for eight pairs of uniovular twins brought up apart. The problem of finding an adequate 0-hypothesis for the non-rectangular probability distributions of the items is discussed; the solution offered to this problem is a systematic matching of all subjects versus all other subjects and ranking the degree of similarity in choice of the twin pairs with pairs derived from the total matching.—R. Kaelbling.

6308. Porter, Ian H., Schulze, Jane, & McKusick, Victor A. (Johns Hopkins U. Hosp.) Genetical linkage between the loci for glucose-6-phosphate dehydrogenase deficiency and colour-blindness in American Negroes. *Ann. hum. Genet.*, 1962, 26(2), 107-122.—By testing with the Ishihara plates in 10 schools, 106 unrelated color blind Negro boys were located. These 106 and their brothers were screened for G-6-PD deficiency by Motulsky's dye method. 15 boys with enzyme deficiency were detected in 10 families. The type and degree of color blindness and the enzyme activity were studied with more accurate methods in members of 8 of these families. To obtain linkage information on the relatively scant data available, the method of Haldane and Smith was used. The odds were 1000 to 1 in

favor of linkage between deutan anomalous vision and G-6-PD deficiency but no evidence was found for linkage between protan anomalous vision and G-6-PD deficiency.—S. G. Vandenberg.

LATERAL DOMINANCE

ANIMAL PSYCHOLOGY

6309. Kling, Arthur, & Orbach, J. (Michael Reese Hosp., Chicago, Ill.) The stump-tailed macaque: A promising laboratory primate. *Science*, 1963, 139(Whole No. 3549), 45-46.—Members of *Macaca speciosa* have characteristics that make them suitable primates for neuropsychological investigation. They work well in discrimination training, have a varied behavioral repertoire and social interaction, and seem to be at least as intelligent as *Macaca mulatta*. They are docile and submit readily to laboratory routine.—Journal abstract.

6310. Miliutina, L. A. (Pirogov Medical Inst., Moscow, USSR) Razvitie nevroticheskogo sostoiianiia u bespolusharnykh golubei. [Development of a neurotic condition in decorticate pigeons.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(2), 349-353.—Repeated electrical stimulation was applied to the legs of 7 decorticate and 5 intact pigeons. After 80-100 stimulations a neurotic condition developed in decorticates manifested in an increased general activity, restlessness, drop in weight, and digestive disturbances. The condition was very stable and resulted in the pigeons' death. No similar condition developed in the controls.—A. Cuk.

6311. Smythe, R. H. Animal habits: The things animals do. Springfield, Ill.: Charles C Thomas, 1962. vii, 181 p. \$5.75.—The author's intent was "to describe the more common habits of a few animals"; however, as the jacket suggests, the book contains "an unbelievable wealth of animal lore." There are illustrated chapters on the locomotory, territorial, feeding, and social habits of creatures from insects to man, as well as a question and answer section covering some miscellaneous habits of animals commonly kept as pets (dog, cat, etc.). Many of the behaviors are discussed in terms of their evolution and relationship to the survival of the individual and the species. Author's approach to instinct versus intelligence is unusual as is his way of bringing man by analogy or implication into his discussions of bird-songs, the staking of territorial claims, and mate selection.—J. M. Havlena.

NATURAL OBSERVATION

6312. Cloudsley-Thompson, J. L. (U. Khar-toum) Rhythmic activity in animal physiology and behaviour. New York: Academic, 1962. 236 p. \$6.80.—Methodology, apparatus, and terms relevant to animal periodic phenomena are reviewed, but the emphasis is upon a comparative and experimental analysis. Rhythms of different wave-lengths (diurnal, lunar, tidal, and seasonal) are discussed in animals from protozoa to mammals. Evidence for biological clocks and their physiological basis is reviewed with respect to exogenous factors, including environment-dependent rhythms and environment-independent rhythms. Orientation, navigation, migration, activity, and other behavior involving timing mechanisms

are extensively treated. Theory plays a minor role; phenomena are principally discussed in terms of how variables produce effects. (500 ref.)—*R. B. Lockard.*

6313. Emlen, John T. (U. Wisconsin) **The display of the gorilla.** *Proc. Amer. Phil. Soc.*, 1962, 106, 516-519.—Besides a score of distinguishable vocalizations which may function for communication, the gorilla displays 4 marked kinds of behavior: (a) hooting, a soft cooing in successive pulses, not aggressive but alerting the group and other animals; (b) chest beating, audible a mile away, employed by males and females, adults and young, but most violently by the male leader; (c) the ground swat by the leader, who runs forward a few steps, swinging his arms and pitching sticks and leaves in the air, and then bringing his arms down with a loud thump on the ground, sometimes crushing a sapling; and (d) a barking roar by the leader when an intruder appears: (a), (b) and (c) occur repeatedly in that order as if to alert his group and perhaps to assert the leader's dominance.—*E. G. Boring.*

EARLY EXPERIENCE (INCLUDING IMPRINTING)

6314. Atkinson, Harriette Seely. (U. Colorado) **The effect of early experience upon hoarding and shock-escape behavior of the albino rat.** *Dissert. Abstr.*, 1962, 22(9), 3263-3264.—*Abstract.*

6315. D'Amato, M. R., & Jagoda, H. (New York U.) **Effect of early exposure to photic stimulation on brightness discrimination and exploratory behavior.** *J. genet. Psychol.*, 1962, 101(2), 267-271.—Albino and pigmented rats were raised in breeding cages under either control illumination conditions (very dim) or experimental conditions (moderately bright illumination). At 71-75 days of age some Ss were given exploratory experience in a brightly illuminated enclosed Y maze. Other Ss were trained on a simple brightness discrimination problem (bright positive) in the Y maze. The experimental variable was without effect on either the amount or pattern of exploratory behavior in the Y maze. Although, on the first 20 trials of discrimination training the experimental Ss made significantly more responses to the bright arm than the control Ss, indicating that the early experience with moderate illumination levels served to reduce negative phototropism, the control Ss achieved the discrimination criterion as fast as the experimental Ss.—*Author abstract.*

6316. Gottlieb, Gilbert. (Dorthea Dix Hosp., Raleigh, N. C.) **A naturalistic study of imprinting in wood ducklings (*Aix sponsa*).** *J. comp. physiol. Psychol.*, 1963, 56(1), 86-91.—Examination of the role of auditory stimulation in the imprinting process of a role-nesting species indicated that the Wood duck hen begins to vocalize in the nest 20-36 hr. prior to the exodus of her young. Rate and intensity of her call increase as time of exodus approaches. Ducklings instantaneously begin their departure from the nest when the hen calls from outside (below). The long period of exposure to the call of the hen prior to exodus allows the ducklings to become aurally imprinted while they are still in the nest. Thus, it becomes unnecessary to account for the ducklings' response by postulating an "innate perceptual mechanism."—*Journal abstract.*

6317. Knight, Walter Rea. (Pennsylvania State U.) **Early social experience, aggressive behavior, and social stress in laboratory rats.** *Dissert. Abstr.*, 1962, 22(7), 2479.—*Abstract.*

6318. Menzel, Emil W., Jr., Davenport, Richard K., Jr., & Rogers, Charles M. (Yerkes Lab. Primate Biology) **The effects of environmental restriction upon the chimpanzee's responsiveness to objects.** *J. comp. physiol. Psychol.*, 1963, 56(1), 78-85.—In sharp contrast to 2-yr.-old wild-born chimpanzees, similarly aged Ss raised in restricted environments were timid of objects, contacted them rarely, and spent most of their time in stereotyped self-directed activities. Restricted Ss raised in pairs were the most timid of all and dependent upon each other for adaptation to stimuli. A restricted group that had had special manipulatory experience surpassed other isolates in object-contact, but only in situations similar to rearing. A restricted group with special visual experience did not differ from maximally restricted Ss who had been reared for 21 mo. in bare gray cubicles. It was argued that restricted chimpanzees are retarded but potentially typical in their responsiveness to objects.—*Journal abstract.*

6319. Rice, Charles E. (Florida State U., Tallahassee) **Imprinting by force.** *Science*, 1962, 138 (Whole No. 3541), 680-681.—An experiment was performed to determine the effect on imprinting strength of forcing the following response during the critical period in chicks. Results of the procedures used indicate that although imprinting occurred with forced following, it was not as strong as it is when the following is voluntary.—*Journal abstract.*

REFLEXES & INSTINCTIVE BEHAVIOR

MOTIVATION & EMOTION

6320. Anderson, W. Dale, & Smith, Orville A., Jr. (U. Washington) **Taste and volume preferences for alcohol in *Macaca nemestrina*.** *J. comp. physiol. Psychol.*, 1963, 56(1), 144-149.—9 *Macaca nemestrina* monkeys trained to identify water and 5, 10, and 20% alcohols by the colors of the containers were tested under 0-, 24-, or 48-hr. fluid deprivation and tended to select water or 5% alcohol when very small quantities of all 4 fluids were presented simultaneously. Level of deprivation affected the consistency of this preference. In a 2nd series of experiments, preference was judged from volume intake in a 2-choice situation. Alcohol concentrations and deprivation levels were the same. Except for an increased consumption of 20% alcohol, the average results for the entire series were similar to those obtained by brief sampling. Position preferences affected the results more with the 2nd technique.—*Journal abstract.*

6321. Bell, F. R. (Royal Veterinary Coll., London, England) **Alkaline taste in goats assessed by the preference test technique.** *J. comp. physiol. Psychol.*, 1963, 56(1), 174-178.—Taste thresholds for sodium bicarbonate solutions have been obtained on 8 goats using the 2-choice preference technique. The thresholds for the alkaline solution are comparable to the taste thresholds already established in goats for the 4 classical taste modalities. When sodium bicarbonate is placed directly into the stomach, the normal marked preference for 1% sodium bicarbonate

is reversed to an almost complete aversion. Although the mechanism of this alteration in taste threshold has not been specifically investigated, it is suggested that it is probably central in origin. (15 ref.)—*Journal abstract.*

6322. Bernstein, Steven, & Mason, William A. (U. Wisconsin) The effects of age and stimulus conditions on the emotional responses of rhesus monkeys: Responses to complex stimuli. *J. genet. Psychol.*, 1962, 101(2), 279-298.—The responses of 47 young rhesus monkeys to 12 stimulus objects arranged in 3 levels of complexity were recorded. In all age groups the total emotion score increased as stimulus conditions grew more complex. Examination of individual response characteristics suggested the following trends. From birth to 3 months of age emotional behavior consists principally of vocalization and nondirected responses such as rocking, crouching, and sucking. Little use is made of the available floor space in withdrawing from a disturbing stimulus. Between 3 months and 2 years of age there is a rapid and progressive increase in the frequency of directed responses including barking, lip-smacking, drawing back the ears, and the fear grimace. Concurrent with these changes is an increased tendency to withdraw from a disturbing stimulus. These changes in the patterns of emotional responses are probably correlated in the native habitat with the waning of the primary mother-infant bond and the corresponding growth of filial independence.—*Author abstract.*

6323. Brown, Judson S., & Belloni, Marigold. (U. Florida) Performance as a function of deprivation time following periodic feeding in an isolated environment. *J. comp. physiol. Psychol.*, 1963, 56(1), 105-110.—An experiment was run to test the prediction that periodic feeding develops associations between drive stimuli and anticipatory drive-producing responses thereby producing a curvilinear relation between performance and deprivation time. Rats living in a sound-shielded room were fed at the same time of day for 35 days. 5 subgroups were tested in their cages under deprivations of 2, 12, 22, 35, and 46 hr. The response measure, frequency of depressions of the empty food troughs, showed a gradual rise from 2 to 22 hr. and beyond, but did not decline thereafter as predicted by the theory under test. Starting and running speed scores in a straight runway also failed to support the curvilinear hypothesis.—*Journal abstract.*

6324. Burrig, Richard G., & Kappauf, William E. (U. Illinois) Preference threshold of the white rat for sucrose. *J. comp. physiol. Psychol.*, 1963, 56(1), 171-173.—28 animals were given a series of 4-min. drinking tests in a 2-choice situation, sucrose solution vs. water. Each test was preceded by forced-sampling of both liquids. The concentration at which 75% of the group made more tongue contacts with the sucrose solution was taken as the preference threshold. This concentration was .32 gm/100 cc of solution. This determination provides a baseline useful for the planning and evaluation of studies designed to map various sucrose isohedons for the rat on the basis of observations in the same test situation.—*Journal abstract.*

Isolation and identification of the sex attractant of the American cockroach. *Science*, 1963, 139(Whole No. 3549), 48-49.—The highly potent sex attractant of the female American cockroach, *Periplaneta americana* (L.), has been isolated in pure form and identified as 2,2-dimethyl-3-isopropylidene-cyclopropyl propionate. The hydrogenated form of the attractant has been synthesized.—*Journal abstract.*

6328. Kaplan, Stephen, & Kaplan, Rachel. (U. Michigan) Skin resistance recording in the unrestrained rat. *Science*, 1962, 138(Whole No. 3548), 1403-1404.—The level of basal skin resistance is proposed as a measure of motivation. It is relatively simple to obtain and can be measured concurrently with behavior of interest to the E. The technique described requires a grid floor, but the assessment procedure does not affect the organism's state because of the subthreshold measuring current that is needed. This method in no way restrains the rat and can therefore be used in an unlimited number of experimental situations.—*Journal abstract.*

6329. Kappauf, William E., Burrig, Richard G., & DeMarco, William (U. Illinois) Sucrose-quinine mixtures which are isohedonic for the rat. *J. comp. physiol. Psychol.*, 1963, 56(1), 138-143.—Sucrose-quinine isohedons re 1, 4, 16, and 40% sucrose were determined for the rat. Isohedonic mixtures were located by the up-and-down method using a group of 24 Ss. An interaction was found between sucrose concentration and quinine hydrochloride concentration in their joint determination of the acceptability of sucrose-quinine mixtures. High levels of quinine always contributed negatively to the acceptability of mixtures. Low levels of quinine made positive contributions to acceptability but did so only when the sucrose component of the mixture was of high concentration. (15 ref.)—*Journal abstract.*

6330. Kavanau, J. Lee. (U. California, Los Angeles) An improved method for deprivation of sleep. *J. appl. Physiol.*, 1962, 17, 375-377.—". . . deer mice have been kept awake for up to 23 hr./day by gentle means with a minimum of exertion. The technique does not lead to noticeable changes in temperament or to sustained weight loss." The equipment, consisting basically of a motor-driven 16-inch cylinder, is described in detail.—*D. R. Peryam.*

Arts Lett.*, 1958, 43, 181-188.—A circular exploratory table, 14 ft. in diameter, marked into 6-in. squares numbered from 1 to 638, was enclosed by a white cloth conical canopy, above which an observation chamber was located. Cylindrical cages in which animals were separately housed could be inserted through the aperture in the table center and their outer walls could be raised or lowered (to begin and terminate trials)

via remote control. Continuous records of behavior during exploration were made. Protocols disclose early systematic exploration of the cage interior, immediate surroundings, and the exterior, followed on successive trials first by brief and later progressively longer excursions from the cage.—*S. J. Lachman*.

6332. Roth, Louis M. (Harvard U.) Hypersexual activity induced in females of the cockroach *Nauphoeta cinerea*. *Science*, 138 (Whole No. 3546), 1267-1269.—Corpora allata control mating in females principally by inducing feeding on the tergum of a displaying male. Mating induces an inhibitory nervous mechanism, the seat of which is posterior to the last abdominal ganglion, causing an immediate loss of receptivity by suppressing feeding behavior. After parturition, females may again be receptive. Transection of the nerve cord before or just after mating causes excessive sexual behavior. (18 ref.)—*Journal abstract*.

6333. Satinoff, Evelyn, & Stanley, Walter C. (U. Pennsylvania) Effect of stomach loading on sucking behavior in neonatal puppies. *J. comp. physiol. Psychol.*, 1963, 56(1), 66-68.—To determine whether the amount of milk in the stomach of a neonatal puppy has any effect on sucking behavior, 2 groups of 15 puppies each were matched for age, litter, weight, and sex and deprived from their mothers for 7½-9½ hr. when they were 1, 2, 3, 4, 5, or 11 days old. At the end of the deprivation period one group was stomach loaded with simulated bitch's milk, and pairs of Ss were placed with the dam and allowed to suck for 30 min. The unloaded Ss sucked for a statistically significantly longer time and gained statistically significantly more weight than their loaded partners. Inhibition of sucking by stomach fullness is present from the day of birth and does not depend on postnatal maturation.—*Journal abstract*.

Psychol.*, 1962, 64(5), 533-540.—A comparison of T maze reversal learning by 4 groups of rats that received different patterns of overtraining in acquisition failed to replicate pre-

vious findings of faster reversal after overtraining. 2 experiments were run to replicate the earlier findings but both revealed no overlearning-reversal effect. "These results appear to be consistent with interpretations in terms of stimulus satiation or of avoidance of nonrewarded cues, but not with interpretations in terms of observing responses, discriminability or frustration.—J. Arbit.

6345. Isaacson, Robert I., Karoly, Andrew J., & Caldwell, Jay S. (U. Michigan) **Alternation phenomena in a cross-maze exploration by rats.** *Pap. Mich. Acad. Sci. Arts Lett.*, 1957, 42, 271-279.—"Four groups involving a total of 54 experimentally naive male and female rats . . . approximately three months old" were run on an elevated + maze (elevated cross maze), any arm of which could be isolated from the rest of the maze by a guillotine door. "Our hypothesis is that if an animal has become acquainted with a maze and then a change is made in components of the maze, the animal will spend time exploring the new component. The animal will be attempting to learn the relationship of this new component to the previously learned maze." This "experiment . . . gives at least indirect support to those theories that postulate curiosity, exploration, or approach to the contextually novel as a general principle of behavior."—S. J. Lachman.

6346. Jacobson, Allan L. (U. Michigan) **Learning in flatworms and annelids.** *Psychol. Bull.*, 1963, 60(1), 74-94.—This article attempts an exhaustive review of the research purporting to demonstrate behavioral modifications in earthworms, planaria, and related organisms. Studies are grouped first according to phylum, and for each of the phyla considered according to certain subcategories of learning: habituation, classical conditioning, instrumental learning, and variability. Examination of the literature reveals that whereas earlier work was often ill-controlled, more recent research has for the most part been rigorous and convincing. It is concluded that learning and related phenomena have indeed been demonstrated clearly in each of these 2 phyla, and that research on these animals provides a promising means of investigating the "molecular" basis of learning. (74 ref.)—*Journal abstract.*

6347. Lukaszewska, I. (Nencki Inst. Experimental Biology, Warsaw, Poland) **Return reaction a test of the space orientation of white rats in the horizontal and perpendicular plane.** *Acta Biol. exp., Warsaw*, 1959, 19, 273-279.—The ability of the rats to return to the starting point in a maze with the double-choice return way was investigated. It has been found that the rats are able to find the correct return way in the horizontal T and Y shaped mazes whereas they are totally unable to do so in a perpendicular maze. It is suggested that the rats have very poor if any orientation in space in the perpendicular plane in contrast to their very good orientation in the horizontal plane.—*Journal abstract.*

Conditioning

6348. Andreeva, V. N. (Pavlov Inst. Physiology, Leningrad, USSR) **K voprosu o vzaimodeistvii ugasatel'nogo i zapredel'nogo tormozheniia.** [Interaction between the extinctive and transmarginal inhibition.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(4), 679-685.—Food CRs were established in 5 dogs of

strong nervous activity using auditory and visual CS. Extinction to an excessively strong stimulus can produce either summation or disinhibition.—A. Cuk.

6349. Borukaev, P. K. (Moscow, USSR) **Kharakter serdetschnogo komponenta biologicheskikh raznogo roda reaktsii v usloviakh korkovogo perekliucheniia.** [Nature of the cardiac component of biologically different reactions under conditions of cortical switch-over.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(4), 695-703.—Alimentary and defensive CR were formed in 3 dogs and it was found that CS produce changes in the heart rate which vary individually.—A. Cuk.

6350. Fedorov, V. K. (Inst. Physiology, Acad. Sciences, USSR) **Nekotorye itogi izucheniia tipologicheskikh svoictiv vysshel' nervnoi deiatel'nosti zhivonnykh.** [Some results obtained in studying the typological properties of higher nervous activity in animals.] *Dokl. Akad. Nauk SSSR*, 1962, 142(6), 1432-1435.—Noting the fact that the various indices used to measure the same properties of nervous systems of animals do not correlate very highly, a systematic investigation of this problem was undertaken. Using mice and rats as Ss, a series of conditioned reflexes was elaborated successively in the same animals. These involved different reflexes and/or altering of the same reflexes. Correlations between number of errors in elaborating any particular pain or reflexes were generally low ranging from $-.50$ to $+.50$. However, correlations between average number of errors in altering a reflex over the whole series and alteration of 2 different reflexes reached $.90$. Thus lability of nervous systems can be quantified if the proper index is used.—H. Pick.

6351. Fel'berbaum, P. A. (Leningrad, USSR) **Dannye o vzaimnosvazi verkhnikh dykhatel'nykh putei s koroii golovnogo mozga.** [Interrelation between the upper respiratory tracts and the cerebral cortex.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(4), 657-664.—By means of a rubber balloon introduced into the trachea of a dog both exteroceptive respiratory CR and interoceptive motor CR were established. A number of experiments with anaesthesia of the mucous were performed in order to study the significance of mechanoreceptor stimulation for the formation of the interoceptive CR.—A. Cuk.

6352. Harwood, C. W. (Western Washington State Coll.) **Operant heart rate conditioning.** *Psychol. Rec.*, 1962, 12(3), 279-284.—This paper describes the 2nd of a planned series of operant autonomic conditioning experiments. The result of this attempt to condition heart rate deceleration was negative. Consideration of changes to be made in the experimental design which may facilitate instrumental conditioning of an autonomic response were presented in the form of discussion of planned research.—R. J. Seidel.

6353. Mikushkin, M. K. (Kirov Military Medical Acad., Leningrad, USSR) **O signal'noi roli interotseptivnykh razdrashitelei v sviazi s vytesneniem ikh iz stereotipa.** [The signal role of interoceptive stimuli in connection with their elimination from the stereotype.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(4), 704-706.—Conditioning performed with 5 dogs showed that interoceptive CS displaced from the stereotype by the exteroceptive CS retain their

signal significance. Collision of positive and negative interoceptive CS displaced from the stereotype resulted in neurosis of 2 of the dogs.—*A. Cuk.*

6354. Noble, Merrill, & Adams, Calvin K. (Kansas State U.) **Conditioning in pigs as a function of the interval between CS and US.** *J. comp. physiol. Psychol.*, 1963, 56(1), 215-219.—The effect of length of CS-US interval on efficiency of classical conditioning in swine was investigated. In the 1st experiment independent groups were tested with intervals of .5, 1, 1.5, and 2 sec. A control condition received CS-only and US-only trials. The 2-sec. condition gave reliably better conditioning than all other intervals. In the 2nd experiment the CS-US intervals were 1, 2, 4, and 8 sec. During early trials conditioning was best for intervals of 1 and 2 sec., but late in training conditioning was best for 4 and 8 sec. These results conflict with those for human Ss and for fish. (21 ref.)—*Journal abstract.*

6355. Noble, Merrill, & Harding, Gherry E. (Kansas State U.) **Conditioning in rhesus monkeys as a function of the interval between CS and US.** *J. comp. physiol. Psychol.*, 1963, 56(1), 220-224.—The optimum CS-US interval for classical conditioning in an infrahuman primate was investigated in 54 rhesus monkeys using CS-US intervals of .5, 1, 2, and 4 sec. The CS was an increase in illumination, and the US was a dc shock lasting .1 sec. Only the 2-sec. condition gave significantly more CRs than the control condition, which consisted of CS-only and US-only trials in random order. The results are discussed in relation to recent theoretical statements.—*Journal abstract.*

6356. Pavlov, B. V., Baru, A. V., Bolotina, O. P., & Prazdnikova, N. V. (Pavlov Inst. Physiology, Leningrad, USSR) **Materialy k sravnitel'noi fiziologii sledovykh uslovykh refleksov.** [Data on comparative physiology of CR.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(4), 630-636.—Food trace and delay CRs were established in 8 golden crucians, 8 pigeons, 8 rabbits, 6 dogs, and 9 monkeys using light and sound as CS. CR was formed rapidly in all animals. The longest duration of the inhibitory phase was recorded in monkeys and the shortest in pigeons.—*A. Cuk.*

6357. Serkov, F. N., & Fedorovich, G. I. (Medical Inst., Odessa, USSR) **O tormozishchem i vzbuzhdaiushchem deistvii dopolnitel'nogo razdrzhitelia na deiatel'nost' golovnogo mozga.** [Inhibitory and excitatory effect of an additional stimulus on the brain activity.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(4), 643-648.—When an additional CS (sound of bell or noise) was added to the ongoing conditioned activity of 4 dogs, it was found that the effect of such a stimulus depends upon the functional state of the organism. In an alert animal, it caused a depression of the conditioned activity revealed by a decrease in positive CR and by disinhibition of differentiations. In animals with a depressed conditioned activity as a result of sedatives the additional stimulus produces increased conditioned salivation.—*A. Cuk.*

6358. Sharov, A. S., Alekseev, M. A., & Zalkind, M. S. (Inst. Higher Nervous Activity Neurophysiology, USSR Acad. Sciences, Moscow) **Elektronnyi differentsiator.** [Electronic differentiator.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(4), 762-768.—De-

scription with diagrams of a new apparatus to measure the motor activity in conditioning.—*A. Cuk.*

6359. Sommer-Smith, J. A., Galeano, C., Piñeyrúa, M., Roig, J. A., & Segundo, J. P. (Inst. Investigación Ciencias Biológicas, Montevideo) **Tone cessation as a conditioned signal.** *EEG clin. Neurophysiol.*, 1962, 14, 869-877.—By means of a standard conditioning routine (instrumental or classical) in which reinforcement occurred shortly after the interruption of a very prolonged sound, 9 cats were trained to react specifically to the cessation of the tone and not to its initiation. During habituation the animals consistently responded more to the beginning of the tone than to its cessation. The learned reaction pattern exhibited the behavioral and electrographic features of a typical conditioned reflex.—*L. C. Johnson.*

6360. Stanley, Walter C., Cornwell, Anne Christake; Poggiani, Constance, & Trattner, Alice. (Roscoe B. Jackson Memorial Lab.) **Conditioning in the neonatal puppy.** *J. comp. physiol. Psychol.*, 1963, 56(1), 211-214.—To determine whether appetitive and aversive conditioning is possible in the puppy less than 2 weeks old, 26 Shetland sheepdog and cocker spaniel puppies were divided into 3 groups and received 7 days of conditioning. They had a mean age of 3 days when training began and a mean age of 10 days when training ended. In each group the CS was a 5-sec. insertion of a manometer nipple into S's mouth. In the positive group the CS was paired with nipple-dropper-feeding of milk; in the neutral group, with reinsertion of the manometer nipple, and in the negative group, with nipple-dropper-"feeding" of a quinine solution. Sucking behavior and struggling by Ss occurred during the CS as expected from the conditions of reinforcement. It was concluded that both appetitive and aversive conditioning can occur in the neonatal puppy and that previous failures to obtain conditioning were due to inadequate conditions for learning rather than to any general unconditionability of the neonatal puppy.—*Journal abstract.*

6361. Stepien, I., & Stepien, L. (Nencki Inst. Experimental Biology, Warsaw, Poland) **The effect of sensory cortex ablations on instrumental (Type II) conditioned reflexes in dogs.** *Acta Biol. exp., Warsaw*, 1959, 19, 257-271.—"After bilateral or unilateral ablations of sensory cortex in dogs the instrumental conditioned reflexes of the manipulatory character (putting foreleg of foodtray, pressing a lever with forelegs) were abolished whereas the locomotor conditioned reflexes were preserved. After a lapse of time the conditioned manipulatory reflexes are restored 'spontaneously' i.e. without any special training. . . . In dogs with total ablation of sensory area I and II the lack of instrumental reactions lasted for 6-10 weeks, whereas in dogs with less extensive ablations it was shorter. The climbing onto a table and going over a barrier was also abolished after sensory lesions and then gradually reappeared. On the other hand the contact placing reaction was permanently lost. The general behaviour of the animals remained quite normal and adequate and their inhibitory conditioned reflexes were preserved." (23 ref.)—*C. T. Morgan.*

6362. Szwedkowska, G. (Nencki Inst. Experimental Biology, Warsaw, Poland) **The transformation of differentiated inhibitory stimuli into posi-**

tive conditioned stimuli. *Acta Biol. exp., Warsaw*, 1959, 19, 151-159.—“The properties of the differentiated inhibitory stimuli were investigated [in 5 dogs] in respect to their rate of transformation into the positive conditioned stimuli. It was found that in the case of fine differentiation the inhibitory stimulus is easily transformed into the excitatory stimulus, while in the case of crude differentiation this transformation is more difficult and imperfect. It can be concluded that in the case of a fine differentiation the stimulus behaves like a primary excitatory conditioned stimulus, whereas in the case of a crude differentiation it resembles a primary inhibitory stimulus.”—C. T. Morgan.

6363. Szwejkowska, G., & Konorski, J. (Nencki Inst. Experimental Biology, Warsaw, Poland) **The influence of the primary inhibitory stimulus upon the salivary effect of excitatory conditioned stimulus.** *Acta Biol. exp., Warsaw*, 1959, 19, 161-173.—“The combined application of an excitatory conditioned stimulus and a primary inhibitory stimulus [12 dogs] leads to the diminution of the effect of the former stimulus. This diminishing effect is stronger during the action of the inhibitory stimulus than after its cessation. The mechanism of the inhibitory conditioned reflexes is discussed.” (22 ref.)—C. T. Morgan.

6364. Wyrwicka, W. (Nencki Inst. Experimental Biology, Warsaw, Poland) **Studies on the effects of the conditioned stimulus applied against various experimental backgrounds.** *Acta Biol. exp. Warsaw*, 1958, 18, 175-193.—“Instrumental alimentary and defensive conditioned reflexes to various stimuli were established in dogs in . . . [a] conditioned-reflex chamber. Then these stimuli were tested in various other experimental situations. It was found that each conditioned stimulus evoked a general conditioned reaction connected with it by training, but the instrumental conditioned reaction was elicited only when some elements from the usual situation were present in the test situation. . . . [A] discussion of the phenomenon is given.”—C. T. Morgan.

6365. Zbrozyna, A. W. (Nencki Inst. Experimental Biology, Warsaw, Poland) **On the conditioned reflex of the cessation of the act of eating: I. Establishment of the conditioned cessation reflex.** *Acta Biol. exp., Warsaw*, 1958, 18, 137-159.—A conditioned reflex of cessation of the act of eating was established in 7 dogs to a stimulus (visual, auditory, or tactile) applied during the meal several seconds before the withdrawal of food. The process of development of this conditioned cessation reflex is described and the curves of salivary secretion during the action of the stimulus signalling the withdrawal of food are compared. The results of investigations concerning the problem of “backward conditioning” are discussed, and the probable mechanism of the conditioned cessation of eating is presented.—*Journal abstract*.

6366. Zbrozyna, A. W. (Nencki Inst. Experimental Biology, Warsaw, Poland) **On the conditioned reflex of the cessation of the act of eating. II. Differentiation of the conditioned cessation reflex.** *Acta Biol. exp., Warsaw*, 1958, 18, 163-174.—In order to analyse further the properties and organization of the conditioned reflex of cessation of

eating, differentiation of this reflex was attempted in 5 dogs. In 3 of them a complete differentiation was obtained. The stimulus signalling the withdrawal of food evoked interruption of the act of eating and retirement from the food tray. The differential stimulus did not seem to influence the act of eating. In one of the dogs it was not possible to establish the conditioned reflex of cessation of eating and in another a severe neurosis developed during the differentiation. The possible mechanism of this differentiation is discussed.—*Journal abstract*.

6367. Zbrozyna, A. W. (Nencki Inst. Experimental Biology, Warsaw, Poland) **On the conditioned reflex of the cessation of the act of eating. III. Extinction of the conditioned cessation reflex.** *Acta Biol. exp., Warsaw*, 1959, 19, 249-255.—The “course of extinction of the conditioned cessation of eating in dogs is described.”—C. T. Morgan.

6368. Zernicki, B., & Ekel, J. (Nencki Inst. Experimental Biology, Warsaw, Poland) **Elaboration and mutual relations between alimentary and water instrumental conditioned reflexes in dogs.** *Acta Biol. exp., Warsaw*, 1959, 19, 313-324.—“In four dogs in the same experimental situation two different instrumental conditioned reflexes were established by food and water reinforcement. In two of these dogs the differentiation between both movements became perfected and they performed in hunger-driven experiments only the alimentary movement and in thirst-driven experiments only water movement. In two other dogs the differentiation was never very precise due to ‘natural’ preference of one of the trained movements.” (17 ref.)—C. T. Morgan.

6369. Zernicki, B., & Konorski, J. (Nencki Inst. Experimental Biology, Warsaw, Poland) **Fatigue of acid conditioned reflexes.** *Acta Biol. exp., Warsaw*, 1959, 19, 327-337.—“When the intertrial intervals were either 6 min. or 3 min. no signs of fatigue of the conditioned reflexes was observed. When the intertrial intervals were 1.5 min., fatigue of conditioned reflexes was clearly manifested in one dog. . . . When the intertrial interval was prolonged, or the strong conditioned stimulus was applied instead of the weak one, the conditioned reflex immediately returned to normal. The fatiguability of conditioned reflex was only temporary and with prolonged training it gradually disappeared.” (20 ref.)—C. T. Morgan.

Discrimination

6370. Baird, J. C., & Becknell, J. C., Jr. (U. Delaware) **Discrimination learning as a function of early form exposure.** *Psychol. Rec.*, 1962, 12 (3), 309-313.—Triangles and circles or rectangles and circles (2 groups) were placed on walls of rearing cages of albino rats from age 26 days to 85 days. Discrimination training with circle negative was then given. $\frac{1}{2}$ were tested with triangle and $\frac{1}{2}$ with rectangle positive. No effect of early experience was found when compared with control rats having no early exposure. Caution is suggested in citing this type of study to support perceptual theory.—R. J. Seidel.

6371. Hitchcock, Lloyd, Jr. (Purdue U.) **Comparative studies of the contribution of areal asymmetry, rotation, and sidedness to form dis-**

crimination. *Dissert. Abstr.*, 1962, 22(7), 2476.—*Abstract.*

6372. Honig, Werner K., Boneau, C. Alan; Burstein, K. R., & Pennypacker, H. S. (Denison U.) Positive and negative generalization gradients obtained after equivalent training conditions. *J. comp. physiol. Psychol.*, 1963, 56(1), 111-116.—Positive and negative gradients were compared on the dimension of angular orientation (tilt) following discrimination training with the presence of a vertical line being positive and its absence being negative for one group of pigeons, and the opposite discrimination for another group. The gradients were initially very similar in form, although the negative gradient became flatter in the course of testing. Equivalent training conditions therefore produced similar positive and negative gradients; previously obtained differences between gradients of acquisition and extinction are presumably due to differences in pretest training procedures.—*Journal abstract.*

6373. Pastore, Nicholas. (Queens Coll.) Perceptual functioning in the duckling. *J. Psychol.*, 1962, 54(2), 293-298.—The perceptual functioning of 16 ducklings was investigated shortly after hatching. Each S was light-deprived prior to its entry to an experimental situation and between blocks of trials during the course of training. All Ss were assigned only one perceptual task. Different groups of 4 Ss discriminated an outline triangle from other outline geometric figures, horizontal from vertical striations, and black from white objects. Brightness constancy was demonstrated in 1 group of 4 Ss. Criterion level was reached by all Ss at the median age of 1 day. The relevance of the results to empiristic and nativistic approaches to perception was briefly discussed.—*Author abstract.*

6374. Sutherland, N. S., Mackintosh, N. J., & Mackintosh, J. (Oxford U.) Simultaneous discrimination training of octopus and transfer of discrimination along a continuum. *J. comp. physiol. Psychol.*, 1963, 56(1), 150-156.—Octopuses taught by a new training procedure mastered a simultaneous shape discrimination of moderate difficulty. 3 predictions from a theory about switching in different analyzing mechanisms were tested. (a) Ss 1st trained to discriminate shapes having a large difference along a dimension subsequently performed better with shapes having a small difference than did Ss trained from the outset on the latter shapes. (b) Performance of Ss originally trained on the difficult discrimination showed marked improvement when transfer tests without opportunity for relearning were given with easier discrimination. (c) Asymptotes of performance of Ss trained by the simultaneous and successive methods were the same on the easier discrimination, but Ss trained by the successive method performed better on the difficult discrimination.—*Journal abstract.*

Avoidance

6376. Grossberg, J. M. (Indiana U.) Pseudo-conditioning, drive reduction, and the acquired fear-drive hypothesis. *Psychol. Rec.*, 1962, 12(3),

299-307.—This is a replication of shuttle-box study by Brown and Jacobs (1949) with added controls. The paradigm involved (a) Stage 1—light-tone pairing followed by shock with no escape possible and (b) Stage 2—avoidance testing to light-tone. Stimuli were terminated upon completion of the barrier jumping response. The added controls were: (a) light-tone or after avoidance response, (b) shock only during Stage 1, or (c) no light-tone or shock during Stage 1. Latencies during testing did not decrease, and response frequency significantly decreased. The acquired fear-drive hypothesis was not supported.—*R. J. Seidel.*

6377. Hoffman, Howard S., Fleshler, Morton, & Jensen, Philip K. (Pennsylvania State U.) Aversive training: Long-term effects. *Science*, 1962, 138(Whole No. 3546), 1269-1270.—3 years ago a tone ending in unavoidable electric shock was periodically presented to pigeons while they pecked a key for food. When pecking was disrupted by tone, shock was disconnected and the training tone and tones of different frequencies were presented. At first all tones caused a reduction in the rate of pecking, but as testing proceeded the gradient narrowed. In our study, testing was resumed after a 2½-year interruption. Despite the interruption the tones still suppress behavior.—*Journal abstract.*

6378. Kirby, Raymond H. (Princeton U.) Acquisition, extinction, and retention of an avoidance response in rats as a function of age. *J. comp. physiol. Psychol.*, 1963, 56(1), 158-162.—In Experiment 1, rats 25, 50, and 100 days old were conditioned in a runway to avoid shock at the sound of a buzzer and then extinguished to a criterion. Of 2 groups at each age level, 1 was randomly selected, trained, and extinguished, and 1 was matched for performance during acquisition and then extinguished in order to study resistance to extinction with original learning held constant. There were no significant differences in acquisition or extinction in matched or unmatched groups. The 2nd experiment measured retention of an avoidance response 1, 25, and 50 days following conditioning at 25, 50, and 100 days. The number of avoidance responses in a 30-trial reconditioning test indicated that retention was significantly lower in the 25-day-old group than in the 2 older groups.—*Journal abstract.*

Reinforcement

6379. Barry, Herbert, & Symmes, David. (U. Connecticut) Reinforcing effects of illumination change in different phases of the rat's diurnal cycle. *J. comp. physiol. Psychol.*, 1963, 56(1), 117-119.—48 albino rats, maintained on an equalized 24-hr. light-dark cycle, pressed a "positive" bar, which altered illumination of the test box, more often than they pressed a "neutral" bar which had no effect. Both bars were pressed at a higher rate by Ss tested during the dark rather than light part of the diurnal cycle. Ss tested for light onset, in a dark box, did not differ in positive-bar preference from Ss tested for light offset, in a light box. However, during successive test sessions positive-bar preference decreased for the light-onset groups and increased for the light-offset groups. It is concluded that bar pressing was reinforced by illumination change, regardless of level of bar pressing activity or direction of illumination change.—*Journal abstract.*

6381. Capaldi, E. J., Hart, Dick, & Stanley, Larry R. (Texas U.) Effect of intertrial reinforcement on the aftereffect of nonreinforcement and resistance to extinction. *J. exp. Psychol.*, 1963, 65(1), 70-74.—2 groups of rats were trained to traverse a straight alley under identical patterns of partial reinforcement; a 3rd group received consistent reinforcement. Both partial groups received intertrial reinforcements, one following nonreinforced trials preceding reinforced ones, the 2nd following reinforced trials preceding either reinforced or nonreinforced ones. The 1st partial group was not more resistant than the consistent group, while the 2nd partial group showed the typical partial reinforcement effect.—*Journal abstract*.

6382. Church, Russell M., & Carnathan, James. (Brown U.) Differential reinforcement of short-latency responses in the white rat. *J. comp. physiol. Psychol.*, 1963, 56(1), 120-123.—This study was concerned with the effect of selective reinforcement of short-latency responses by rats in a lever box. After discrimination training, each of 8 experimental Ss was reinforced on all trials in which its response latency was less than the median of its latencies on the previous day. Relative to control Ss that received the same number and sequence of reinforcements, experimental Ss were similar with respect to the mean log latency of response but the latency distribution of experimental Ss was more variable than that of the control Ss ($p < .01$). These results suggested that differential reinforcement of short-latency responses may be more closely related to stimulus discrimination than to response differentiation.—*Journal abstract*.

6383. D'Amato, M. R., Schiff, Donald, & Jagoda, Harry. (New York U.) Resistance to extinction after varying amounts of discriminative or nondiscriminative instrumental training. *J. exp. Psychol.*, 1962, 64(5), 526-532.—Using albino rats, support was found for the hypothesis that acquisition level and resistance to extinction would be monotonically related for a simple (nondiscriminative) instrumental response (bar pressing), but the function would be non-monotonic for a comparable discriminative response (successive brightness discrimination). It was also found that the discriminatively trained Ss were more resistant to extinction than those trained on the simple instrumental response. (20 ref.)—*J. Arbit*.

6384. Egger, M. David, & Miller, Neal E. (Yale U.) When is a reward reinforcing? An experimental study of the information hypothesis. *J. comp. physiol. Psychol.*, 1963, 56(1), 132-137.—A secondary reinforcement paradigm was used to try to find the point in the sequence of delivery and consumption of reward at which reinforcement occurs. A food pellet always preceded a stimulus which signalled the delivery of 3 additional pellets. For 12 Ss (albino rats) receiving only this sequence during training, the stimulus was redundant; for 12 others who received, in addition, unpredictable single pellets alone, the stimulus was informative. When Ss were allowed to press a bar on an FR 3 schedule for 1 sec. occurrences of the training stimulus, the group for

whom the stimulus had been informative pressed significantly more ($p < .01$) than did the group for whom the stimulus had been redundant.—*Journal abstract*.

6385. Gleitman, Henry, & Herman, Magdalena M. (Swarthmore Coll.) Replication report: Latent learning in a T maze after shock in one end box. *J. exp. Psychol.*, 1962, 64(6), 646.—Previous studies have shown latent learning in a T maze with highly differentiated end boxes. Appropriate choice behavior was found when rats were shocked in one or the other of the 2 end boxes following equal numbers of reinforcements on both sides. With minor modifications the original experiment was replicated, and the major finding was substantiated although with some difference in magnitude of the effects. The effect of the development of strong turning or place preferences is noted.—*J. Arbit*.

6386. Hill, Winfred F., & Spear, Norman E. (Northwestern U.) Resistance to extinction as a joint function of reward magnitude and the spacing of extinction trials. *J. exp. Psychol.*, 1962, 64(6), 636-639.—"Rats received 25 trials of acquisition and 20 trials of extinction in a straight alley, with reward magnitude (four pellets or one) and intertrial interval in extinction (20 sec. or 24 hr.) varied factorially. Resistance to extinction was greater for large reward and for spaced extinction, without the interaction predicted from a comparison of earlier studies. Marked reminiscence was observed from day to day in acquisition."—*J. Arbit*.

6387. Hulse, Stewart H. (Johns Hopkins U.) Partial reinforcement, continuous reinforcement, and reinforcement shift effects. *J. exp. Psychol.*, 1962, 64(5), 451-459.—"Instrumentally conditioned licking was studied in two experiments as a function of ratio of reinforcement and shifts in the concentration of a saccharin reinforcer. With partial reinforcement (PRF), a shift in concentration produces an immediate change in licking rate in the direction of the shift. With continuous reinforcement (CRF), the immediate reaction to the shift is always a decrease in response rate. . . . The data suggest that, with PRF, behavior is more critically and permanently under the control of reinforcement stimuli than with CRF. This happens because PRF provides discrimination training for reinforcement stimuli, but CRF does not."—*J. Arbit*.

6388. Jenkins, Herbert M. (Bell Telephone Lab., Murray Hill, N. J.) Resistance to extinction when partial reinforcement is followed by regular reinforcement. *J. exp. Psychol.*, 1962, 64(5), 441-450.—A food-reinforced, key-peck response in the pigeon was used to study resistance to extinction following different amounts of training under different reinforcement conditions. It was concluded that the abruptness of the local transition between training and extinction is not critically involved in producing the partial reinforcement effect.—*J. Arbit*.

6389. Lawrence, Douglas H., & Festinger, Leon. (Stanford U.) Deterrents and reinforcement: The psychology of insufficient reward. Stanford, Calif.: Stanford Univ. Press, 1962. vi, 180 p. \$4.75.—This volume presents data from 15 original experiments which apply the theory of cognitive dissonance to problems in animal learning. The general argument is that "if an organism continues to engage in

an activity while possessing information that, considered alone, would lead it to discontinue the activity, it will develop extra attraction for the activity . . . in order to give itself additional justification for continuing to engage in the behavior." This argument is applied to the effects of partial reward, delay of reward, and high effort on resistance to extinction. Some of the conclusions are that the number of unrewarded trials—not the ratio of rewarded to unrewarded trials—during acquisition determine resistance to extinction, and that increasing the effort that an animal must expend in order to reach a reward increases the resistance to extinction. Several other results, usually consistent with dissonance theory, are also reported.—*K. E. Davis.*

6390. Leaton, R. N., Symmes, D., & Barry, H., III. (Yale U.) Familiarization with the test apparatus as a factor in the reinforcing effect of change in illumination. *J. Psychol.*, 1963, 55(1), 145-151.—The effect of contingent dim light onset and offset on lever pressing by albino rats was studied in groups with 0, 2, and 7 days of prior familiarization with the test box. Both light onset and light offset were found to be reinforcing for rats familiar with the test box, but the offset effect was much smaller than the onset effect. Rats without prior familiarization showed no reinforcing effect of illumination change during the first few test sessions, but a significant reinforcing effect developed for the light onset group over sessions. The light offset group showed no such delayed reinforcing effect.—*Author abstract.*

6394. Renner, K. Edward. (Northwestern U.) Influence of deprivation and availability of goal box cues on the temporal gradient of reinforcement. *J. comp. physiol. Psychol.*, 1963, 56(1), 101-104.—A factorial design, using 3 intervals of delay, 2 levels of food deprivation, and presence or absence of goal related stimuli in the delay chamber, was employed to study acquisition and extinction performance of rats in a straight alley runway. The well established temporal gradient of reinforcement was obtained; this gradient was affected by drive level and availability of goal box cues, with drive level and delay combining additively, and with the cues facilitating performance only when reinforcement was delayed. High drive animals extinguished faster than low drive animals. The acquisition and extinction performance of the animals was discussed in terms of delay of reward as a frustration.—*Journal abstract.*

Motivation & Learning

6403. Goldstein, Henry, & Spence, Kenneth W. (State U. Iowa) Performance in differential conditioning as a function of variation in magnitude of reward. *J. exp. Psychol.*, 1963, 65(1), 86-93.—4 groups of rats designated Groups 10-0, 10-1, 10-5, and 5-1 were run in a differential conditioning experiment. The numerals refer to the number of food pellets (W_g) associated with the 2 discriminanda (white and black alleys). Ss ran 75 trials to each alley. Differentiation within an S occurred in groups re-

warded in both alleys much as it did in Ss given no reward on 1 of the discriminanda. Rate of differentiation was positively related to differences in W_g . Comparison between groups showed that the function relating asymptotic response speeds for both large- and small-reward discriminanda was a negatively accelerated increasing one. Also, the finding that response speeds based on a given reward magnitude were the same whether it was the larger or the smaller of the 2 rewards implies that asymptotic performance is determined by the absolute magnitude of the reward and not by some other factor(s) based on contrast or relative effects, e.g., frustration.—*Journal abstract.*

6409. Kainz, Friedrich. (U. Vienna) *Die "Sprache" der Tiere: Tatsachen, Problemschau, Theorie.* [The "language" of animals: Facts, review of problems theory.] Stuttgart, Germany: Ferdinand Enke, 1961. viii, 322 p. DM 29.50.—Part I is a review of the facts known concerning communication in insects, fish, reptiles and amphibia, birds, and apes and other mammals. Part II is concerned with the systematics and theory of animal "language." In addition to inborn expressive functions, animal communication some times shows: imparting of information, change through learning, abbreviation and ritualization, remote beginnings of symbolism, and additive combinability of single signs. However, morphological declining and syntactical combination of its symbols are exclusive to human language. Language is a "productive system," while for animal communication, which remains limited to an unproductive sys-

tem, only primitive advances in regard to extension of itself are possible. Animal communication fails to show the fuller development of human language since neither the vital needs within their environment nor the structure of their biologically conditioned societies demands it.—N. M. Ginsburg.

The analysis and classification of delayed reactions.* *Acta Biol. exp., Warsaw*, 1959, 19, 175-197.—In "the course of delayed reactions the processes of recent memory, as well as stable memory processes, are involved."—C. T. Morgan.

6411. Lawicka, W. (Nencki Inst. Experimental Biology, Warsaw, Poland) *Physiological mechanism of delayed reactions: II. Delayed reactions in dogs and cats to directional stimuli.* *Acta Biol. exp., Warsaw*, 1959, 19, 199-219.—"The present paper is concerned with the properties of the delayed reactions in normal dogs and cats to acoustic and visual directional preparatory stimuli in a triple choice experimental situation. The delays attained under our experimental condition exceeded twelve minutes for dogs and six minutes for cats, and were probably considerably longer. During the delay period, the animals did not preserve their bodily orientation towards the signalled foodtray. . . . Such distracting factors applied during the delay period as extraneous stimuli evoking an orienting reaction, screening of the starting platform, receiving food on the platform, and (in dogs) taking the animal out of the room, did not significantly disturb the correct post-delay response. . . . The cats were in general more prone to make mistakes than the dogs."—C. T. Morgan.

6412. Lilly, John C. (Communications Research Inst., Miami) *Vocal behavior of the bottlenose dolphin.* *Proc. Amer. Phil. Soc.*, 1962, 106, 520-529.—The bottlenose dolphin *Tursiops truncatus* can emit under water and in air many kinds of sounds: whistles, sonic clicks, ultrasonic clicks, rapid trains of clicks, and with training many sounds resembling human speech. The 1st 4 kinds of sounds seem to be used in communication between dolphins, antiphonally or in a series of clicks alternating between the 2 participants. The "humanoid" sounds are produced by imitation of often repeated words of the Es and may be very loud in air. They are pitched high and may become intelligible only when a recording of them is slowed down to as much as $\frac{1}{4}$ speed. Training is slow and attachment of meaning to these words has yet to be achieved.—E. G. Boring.

6413. Wright, P. L., Kay, H., & Sime, M. E. (U. Sheffield, England) *The establishment of learning sets in rats.* *J. comp. physiol. Psychol.*, 1963, 56(1), 200-203.—Rats were trained to a criterion on a series of up to 32 shape discriminations in a discrimination box. 3 animals learned all 32 problems, 1 learned only 10, and the remaining 11 animals mastered between 16 and 28 problems. Progressive improvement occurred from problem block to problem block although the rats took many more trials to learn individual problems than do monkeys or most other mammals thus far investigated in learning-set studies. It is suggested that new procedures are needed to facilitate learning of individual problems so that it

becomes feasible to present longer series of problems to rats.—*Journal abstract.*

SOCIAL BEHAVIOR

6414. Dobrzanska, J. (Nencki Inst. Experimental Biology, Warsaw, Poland) **Partition of foraging grounds and modes of conveyings information among ants.** *Acta Biol. exp., Warsaw*, 1958, 18, 55-67.—Experiments are described which demonstrate that "the existence of at least two forms of adaptation of social foraging may be assumed. In some species this adaptation consists of a definite partition of the foraging grounds, in other species, which have no permanent partition of the territory, the individual, which discovered prey, notifies it to other workers."—C. T. Morgan.

6415. Horel, James A., Treichler, F. Robert, & Meyer, Donald R. (Ohio State U.) **Coercive behavior in the rhesus monkey.** *J. comp. physiol. Psychol.*, 1963, 56(1), 208-210.—Dominance relationships were observed in 8 female monkeys trained to turn a handle to obtain food and paired in the handle-turn apparatus with their cagemates. With the dominant member of a pair established, only the responses of the submissive animal were rewarded with food, requiring the dominant animal to obtain its food by interception of pellets produced by the submissive. When the dominant became proficient at interception, the submissive was fed prior to the sessions, thus setting up the task for the dominant of manipulating its preferred partner to obtain food. The proper manipulations occurred only after several sessions, or after special training. The results were taken as evidence for S-R interpretations of behavior in primate observation learning and communication.—*Journal abstract.*

ABNORMAL BEHAVIOR

6416. Fonberg, E. (Nencki Inst. Experimental Biology, Warsaw, Poland) **The manifestation of the defensive reactions in neurotic states.** *Acta Biol. exp., Warsaw*, 1958, 18, 89-113.—"In three dogs the special instrumental defensive reactions which had been elaborated as a 'defence' against some particular noxious stimulus, appeared in the neurotic state. In two of them, where air-puff into the ear was used as noxious stimulus for the elaboration of defensive reflexes, the 'shaking off' reaction also appeared. In the 4th dog, where the neurotic disturbances were the weakest, only the 'shaking off' reactions were present. . . . The defensive instrumental reactions appeared in the neurotic state even in those dogs where due to a long break in its application they had already ceased to appear to the conditioned stimulus for which they were elaborated. The appearance of defensive reactions in the neurotic state was explained by the theory of anxiety reduction." (54 ref.)—C. T. Morgan.

DEVELOPMENTAL PSYCHOLOGY

6417. Szold Institute for Child and Youth Welfare. (Jerusalem, Israel) **Histaglut noar hayisreelit.** [Adjustment of youth in Israeli society.] Jerusalem, Israel: SICYW, 1961. 96 p.—Lectures and discussions held during the Symposium on Childhood and Youth Problems on the occasion of the centenary of Henrietta Szold. Introductory addresses

were given on Szold, on Jewish youth in Israel and in the Diaspora, and on the adjustment of youth in Israeli society. 6 groups discussed the following items: education towards values, children and adolescents in urban poor quarters, talented youth coming from backward strata, adjustment of mentally retarded children, problems of working youth, and the juvenile child and his treatment.—H. Ormian.

INFANCY

6418. Dreger, Ralph Mason. (Jacksonville U.) **Comparative psychological studies of Negroes and whites in the United States: A reclarification.** *Psychol. Bull.*, 1963, 60(1), 35-39.—Pasamanick's "clarification" of Dreger and Miller's article extends the meaning of the original beyond its intent. In conjunction with Pasamanick's 1946 article it is shown that the samples of white and Negro infants are inadequate. Dreger and Miller could not have been aware of Pasamanick's 1946 reliability procedures for these were not described until his 1962 clarification. In 1962 Pasamanick's "major comparison" between white and Negro infants does not seem to be the same as it was in 1946. Contrary to Pasamanick's contention, Dreger and Miller did not attack Gesell's Developmental Schedules. Later work done by Pasamanick may substantiate his conclusions, but the criticisms of his 1946 article still hold.—*Journal abstract.*

6419. Engen, Trygg; Lipsitt, Lewis P., & Kaye, Herbert. (Brown U.) **Olfactory responses and adaptation in the human neonate.** *J. comp. physiol. Psychol.*, 1963, 56(1), 73-77.—Changes in the human neonate's activity and respiration following olfactory stimulation are reported. Results of 2 experiments demonstrate that (a) the neonate does respond to such stimulation and in different degrees to acetic acid, asafetida, phenylethyl alcohol, and anise oil; and (b) there is adaptation with repeated stimulation by asafetida and anise oil, and recovery of response following a temporal delay. Order of presentation of odors also affects the occurrence of response. No clear differences were obtained between so-called pleasant and unpleasant odors. Alternative interpretations are suggested for the adaptation effect and response differences between odors. Response differentiation, or increased refinement of response with increased practice, was observed to occur.—*Journal abstract.*

6420. Kessen, William, & Leutzendorff, Anne-Marie. (Yale U.) **The effect of nonnutritive sucking on movement in the human newborn.** *J. comp. physiol. Psychol.*, 1963, 56(1), 69-72.—30 newborn human infants were observed on 4 occasions during the lying-in period to determine the behavioral consequences of nonnutritive sucking. On 2 of these occasions a bottle-nipple placed over E's finger was inserted in S's mouth for 30 sec.; on the other 2 occasions E stroked S's forehead lightly with a cloth for 30 sec. Determinations were made of S's movement and, for 20 Ss, of mouthing and crying. Within 5 sec. of nipple insertion S's movement dropped to a significantly lower level; within 25 sec. after the removal of the nipple S's movement had returned to baseline levels. Nipple insertion produced a significantly higher level of mouthing and a significantly lower level of crying. No significant effects of the forehead stimulation were found.—*Journal abstract.*

CHILDHOOD

6421. Baer, Melvyn J., Torgoff, Irving H., & Harris, Donna J. (Merrill-Palmer Inst., Detroit, Mich.) Differential impact of weight and height on Wetzel developmental age. *Child Developm.*, 1962, 33(4), 737-750.—Comparisons of the Wetzel developmental age with height and weight age were made in terms of pattern and level. Results show that the Wetzel developmental age is more closely associated with weight age particularly when weight age exceeds height age. Fluctuating weight age conveys the impression of erratic growth in size when such may not be the case. There is a need to supplement the Wetzel developmental age with assessments of height and weight.—W. J. Meyer.

6422. Fedorov, V. K. (Leningrad, USSR) Nekotorye fiziologicheskie mekhanizmy nachalnogo razvitiya psikhicheskoi zhizni rebenka. [Some physiological mechanisms of the early development of mental life of the child.] *Vop. Psikh.*, 1962, No. 3, 149-154.—With observations based mainly on his own little boy, the author traces the development of speech of a child from the birth cry, through whimpering, babbling, and the beginning of specific words. These latter are discussed in the context of imitative and conditional responses. Even at 3 years the child does not use language in an inferential and problem solving way, but still as a set of learned responses.—H. Pick.

6423. Geréb, G. (Pedagogical U. Szeged, Hungary) Experimentelle Untersuchungen über die psychische Ermüdung bei Kindern. [Experimental investigation of mental fatigue in children.] *Psychiat. Neurol. med. Psychol., Leipzig*, 1962, 14(11), 403-408.—In response to questionnaires, about 6000 school-children described how they spent their days. Tests were given to roughly 10% of these. Flicker fusion frequency and specially construed measurements of visuomotor coordination, visual and auditory associations, responses to light, sound, and to electrical shock were tested to assess the degree of fatigue, which was correlated with the stresses engendered by school-work. Allegedly because the children were over-burdened, had inadequate time for sleep and recreation, they developed neuroses.—R. Kaelbling.

6424. Lange, Ulrich. Über das Suchen elternloser Kinder nach ihren leiblichen Angehörigen. [On the search of orphans for their blood relatives.] *Prax. Kinderpsychol. Kinderpsychiat.*, 1962, 11(5), 172-177.—Such children often seem satisfied after having found the names of their parents. 2 cases are reported.—E. Katz.

6426. LeVine, Barbara Bloom. (Northwestern U.) Punishment techniques and the development of conscience. *Dissert. Abstr.*, 1962, 22(7), 2486-2487.—Abstract.

6427. Lyamina, G. M., & Gagua, N. P. (Acad. Medical Sciences, Moscow, USSR) Osobennosti rechevnykh reaktsii u detei tret'ego goda zhizni. [Properties of speech reaction in children of the third year of life.] *Vop. Psikh.*, 1962, No. 3, 155-166.—The speech reactions of 20 children were studied as

they responded to presentation of pictures along with the question: "What is it?" Latent periods of response were measured as a function of the interval between presentation trials, the length of presentation of the various pictures, and the state of alertness of child. The latencies were generally shorter when the presentation times were short and intertrial intervals short and the children were alert. The quality of the speech was also analyzed as a function of the state of alertness of the children. A greater percentage of alert children responded adequately to E's question and there were fewer articulation errors.—H. Pick.

6428. McClintock, Robert Edgar. (George Peabody Coll. Teachers) A factor analytic study of tendencies of first grade children to continue task responses. *Dissert. Abstr.*, 1962, 22(8), 2884-2885.—Abstract.

6429. Makhikh, E. S. (Inst. Psychology, Moscow, USSR) Igrovaya motivatsiya v pionerskoi rabote. [Play motivation in pioneer [youth organization] work.] *Vop. Psikh.*, 1962, No. 3, 117-126.—The present article discusses the role and function of children's play so as to arrive at an understanding of the best relation between play and serious activity in the pioneer organization. The function of role playing is given the most attention. It is suggested that children learn and practice new forms of behavior by playing roles when they are unable to assume the actual duties of their heroes. Also play is said to help create motivation when tasks are uninteresting but such use of play is not necessary when children are motivated by the task itself.—H. Pick.

6430. Morino-Abbele, Francesca. (Inst. Psychology U. Florence, Italy) Le basi costruttive dei processi logicomatematici del pensiero. [The constructive basis of logicomathematical thought processes.] *Boll. Psicol. appl.*, 1961, No. 45-46, 3-34.—Preliminary results of a continuing research project are presented. 9 6-year-old children in the 1st year of elementary school were studied in a "game" situation similar to that used by Piaget and Dienes. So unconsciously acquired mathematical concepts after an initial phase of unorganized activity, and a sense of "discovery" was observed to accompany the concept learning. (22 ref.)—R. J. Kaplan.

6431. Piaget, Jean, & Bang, Vinh. Recherches sur le développement des perceptions: XLI. L'évolution de l'illusion des espaces divisés (Oppel-Kundt) en présentation tachistoscopique. [Research on the development of perceptions: XLI. The evolution of the illusion of divided spaces (Oppel-Kundt) with tachistoscopic presentation.] *Arch. Psychol., Geneva*, 1961, 38(Whole No. 149), 1-21.—Data are presented on comparisons of 5-7 year old children and adults with free and also with tachistoscopic presentation of the materials that create the illusion of divided spaces. The data are discussed in relation to a theoretical framework, presented in Piaget's book *Les Mécanismes Perceptifs*.—H. C. Triandis.

6432. Piaget, Jean; Matalon, Benjamin, & Bang, Vinh. Recherches sur le développement des perceptions. XLII. L'évolution de l'illusion dite "verticale-horizontale" de ses composantes (rectangle et équerre) et de l'illusion de Delboeuf en présentation tachistoscopique. [Research on the development of perceptions: XLII. The evolution of the hori-

zontal-vertical illusion from its constituent elements and the Delboeuf illusion in tachistoscopic presentation.] *Arch. Psychol., Geneva*, 1961, 38 (Whole No. 149), 23-68.—An examination of temporal effects obtained with tachistoscopic presentation of the materials that create the horizontal-vertical and Delboeuf illusions. Data are presented from 5- to 7-year-old children and adults.—*H. C. Triandis*.

6433. Piaget, Jean, & Morp, Albert. *Recherches sur le développement des perceptions: XLIII. La comparaison des verticales et de horizontales dans la figure en équerre.* [Research on the development of perceptions: XLIII. The comparison of the vertical and horizontal lines in the L-shaped (with equal size of lines) figure.] *Arch. Psychol., Geneva*, 1961, 38 (Whole No. 149), 69-88.—The vertical line in the L-shaped (with equal size of lines) figure is always overestimated. Significant variations in the overestimation are shown to be a function of age, practice, and the order of presentation of the figures.—*H. C. Triandis*.

6434. Taguchi, T. (Fukushima U.) *A study of the structure of colloquial Japanese from the standpoint of developmental psychology.* *Jap. J. Psychol.*, 1962, 33(4), 193-201.—A study of the free speech patterns of preschool and school children was conducted and analyzed. Among other findings, it was noted that sentence length in spoken language is short and that the ratio of complex sentences gradually increases with age. It was also concluded that a period of significant speech development in Japanese children occurs between the 3rd and 5th grades.—*A. Barclay*.

6435. Webster, Elizabeth Jane. (Columbia U.) *Fears and worst happenings as reported by southern children.* *Dissert. Abstr.*, 1962, 22(8), 2872.—*Abstract*.

6436. Zimny, George H., & Weidenfeller, Edward W. (Marquette U.) *Effects of music upon GSR of children.* *Child Develpm.*, 1962, 33(4), 891-896.—2 excerpts of musical selections, one judged to be exciting and the other to be calming, were played to kindergarten, 3rd- and 6th-grade children, while continuous GSR measures were taken. It was hypothesized that the exciting music would produce a decrease and the calming music an increase in electrical skin resistance. The hypothesis was confirmed. In comparison with college Ss and psychotics, the children were more responsive, evidenced a shorter latency and a greater magnitude of response to the exciting music, and a greater magnitude but not shorter latency to the calming music.—*W. J. Meyer*.

6437. Zinchenko, V. P., Chzhi-tsin, Van, & Tarakanov, V. V. (Inst. Psychology APN RSFSR) *Stanovlenie i razvitie pertseptivnykh deistvii.* [Formation and development of perceptive activity.] *Vop. Psikhol.*, 1962, No. 3, 1-14.—A distinction is made between perceptual and recognition behavior, the former being the activity which occurs when a person explores and becomes acquainted with a new object. Recognition behavior involves the identification of previously known objects. These 2 kinds of behavior are ordinarily mixed in real life situations. The present study examines eye movements as they occur with children from 3-6 years in age under these 2 kinds of tasks. Age trends are noted for both ac-

tivities. In a perceptual task eye movements conform more to the contour of the object and increase in rate as age increases. In a recognition task the younger children's eye movements are in closer correspondence to the contour of the object while the older children don't tend to scan the whole object.—*H. Pick*.

Learning

6438. Bear, Donald M. (U. Washington, Seattle) *A technique of social reinforcement for the study of child behavior: Behavior avoiding reinforcement withdrawal.* *Child Develpm.*, 1962, 33(4), 847-858.—"A talking cowboy puppet was used to study the development of children's behavior to produce and maintain his attention, a stimulus event which could function as a social reinforcer. Using an aversive schedule of attention withdrawal, behaviors were produced in children to produce and maintain the puppet's attention, apparently to the degree that these children typically sought attention in the nursery school setting. One child who would respond only minimally to produce the puppet's attention alone was caused to respond vigorously and efficiently when the puppet's attention was made discriminative for other reinforcements (trinkets).—*W. J. Meyer*.

6439. Clarkson, Frank Edward. (Clark U.) *A developmental analysis of the performance of children and adults on a maze learning and an embedded figures task.* *Dissert. Abstr.*, 1962, 22(7), 2472-2473.—*Abstract*.

6440. Degtiar', E. N. (Pavlov Inst. Physiology, Leningrad, USSR) *Rol' razlichnykh analizatorov v vyrobotke sistemnosti.* [Role of different analyzers in the elaboration of systemic patterns.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(4), 602-605.—Eye-lid CRs were formed in 68 Ss (5½ yr.-7½ yr.) in response to systems of visual, auditory, and verbal stimuli. The systemic pattern was formed more rapidly in response to direct than to verbal stimuli. It was formed sooner when 2 analyzers were involved. Introduction of the motor analyzer speeded the formation of the systemic pattern of temporary connections.—*A. Cuk*.

6441. Di Vesta, Francis J., & Stover, Donald O. *The semantic mediation of evaluative meaning.* *J. exp. Psychol.*, 1962, 64(5), 467-475.—2 experiments were carried out using 5th-grade children. In each the 1st phase consisted of assign development by conditioning signs with evaluative meaning to neutral nonsense syllables. Phase 2 involved associating the assign with a neutral nonsense figure. In the 3rd phase Ss rated the nonsense figure on 3 semantic differential evaluative scales. Ratings of the figures labelled with conditioned assigns corresponded with the evaluative meaning of signs associated with the assigns.—*J. Arbit*.

6442. Epstein, Ralph. (Ohio State U.) *Verbal conditioning in children as a function of sex-role identification, internal control, and need for approval.* *Dissert. Abstr.*, 1962, 22(7), 2462.—*Abstract*.

6443. Jeffrey, Wendell E., & Skager, Rodney W. (U. California, Los Angeles) *Effect of incentive conditions on stimulus generalization in children.* *Child Develpm.*, 1962, 33(4), 865-870.—The gra-

dients of spatial generalization of 7-year-old children were examined under conditions of high and low incentives. Comparison groups of 10-year-old children were also used. Generalized responses for the young high incentive groups were similar to those for both incentive groups among the older children. "Thus the hypothesis that spatial generalization gradients for the younger Ss could be affected by the manipulation of incentive conditions is supported."—*W. J. Meyer.*

6444. Kendler, Tracy S., & Kendler, Howard H. (Barnard Coll.) Inferential behavior in children as a function of age and subgoal constancy. *J. exp. Psychol.*, 1962, 64(5), 460-466.—"Children of two age levels, namely 5-6 and 8-10 yr., were presented with a task that required the linkage of two out of three discretely acquired segments of behavior. The solution consisted of making an initial choice between two of the segments (on correct and the other incorrect) and then integrating the product of that choice with the third segment. The solutions could be direct (inferential), i.e., that goal achieved without any unnecessary responses. They could be indirect, i.e., the goal achieved after the repetition of previously acquired but presently irrelevant behavior segments." The results are discussed in terms of age and the method of solution and in terms of the variables determining the integration which is produced.—*J. Arbit.*

6445. Myers, N. A., & Myers, J. L. (U. Massachusetts) Effects of secondary reinforcement schedules in extinction on children's responding. *J. exp. Psychol.*, 1962, 64(6), 586-588.—"Kindergarten children were trained in a free operant situation with candy as a reward. A group receiving 20% buzzer presentations in training, and shifted to 100% buzzer in extinction responded significantly more than similarly trained groups shifted to 20% buzzer and 0% buzzer in extinction. This 100% buzzer group also performed better than a group which was similarly extinguished but which had not experienced the buzzer in training. It was concluded that a secondary reward effect was demonstrated."—*J. Arbit.*

6446. Ringness, Thomas A. (U. Wisconsin) GSR during learning activities of children of low, average, and high intelligence. *Child Developm.*, 1962, 33(4), 879-889.—3 groups of 40 Ss each, equally divided as to sex, were given classroom-like tasks to learn, i.e., arithmetic. During the entire learning sessions GSR reactions were recorded. The groups were differentiated according to WISC IQ: 50-80, 90-110, and 120 or over. The hypothesis that the mentally retarded would be more threatened by the learning tasks and thus evidence more autonomic reactivity was not supported. The brighter children showed the greatest reactivity. Girls were more reactive than boys. Certain disadvantages in the tasks are explored.—*W. J. Meyer.*

6447. Ryan, Thomas J., & Cantor, Gordon N. (State U. Iowa) Response speed in children as a function of reinforcement schedule. *Child Developm.*, 1962, 33(4), 871-878.—2 groups of 20 preschool children were used in a lever pulling task. Group 100 received a marble for each pull while Group 50 received a marble on only $\frac{1}{2}$ the trials. In terms of movement speed, Group 50 responded with increasing speed relative to Group 100. This

was interpreted as showing that nonreward increased drive. In terms of starting time, Group 100 was initially superior but there were decreasing differences over trials. Competing responses, motivationally and/or associatively produced, may have produced the latter finding.—*W. J. Meyer.*

6448. Schusterman, Ronald J. (Yerkes Lab. Primate Biology) The use of strategies in 2-choice behavior of children and chimpanzees. *J. comp. physiol. Psychol.*, 1963, 56(1), 96-100.—Adult chimpanzees and 3 groups of human children (ages 3.5, 5.1, and 10.8) were tested in a 2-choice situation consisted of a 50:50 probability series. Chimpanzees and the 2 older groups of children were tested with and without initial 100% training. Approximately $\frac{1}{2}$ the Ss in each group received Short-Run (conditional probability .39) and the other $\frac{1}{2}$ Long-Run (conditional probability .64) sequences. Initial training and series contingencies had their strongest effects on behavior of 10-yr.-old children. Chimpanzees and 3-yr.-old children showed a strong win-stay, lose-shift strategy. This strategy was weaker in 5-yr.-old children. Under Short-Run conditions 10-yr.-old children showed greater persistence with an unsuccessful choice than 5-yr.-old children. Results indicate that choice of strategy and effect of patterns of reinforcing events on strategy interact with maturational and species variables.—*Journal abstract.*

6449. Spiker, Charles C., & Norcross, Kathryn J. (State U. Iowa) Effects of previously acquired stimulus names on discrimination performance. *Child Developm.*, 1962 33(4), 859-864.—"The transfer discrimination learning performance of three groups of preschool children was compared. The groups differed in kind of pretraining experience with the pictures of the transfer task. Group N had learned discrete names for the two pictures. Groups D₁ and D₂ had learned appropriately to say 'same' or 'different' when presented with settings of these pictures. Group D₁ had been shown the pictures in simultaneous settings while group D₂ had responded following successive, single presentations of the stimuli. Analysis of correct responses in 30 transfer trials indicated that in the later stages of learning group N was significantly superior to either group D₁ or D₂. Possible hypotheses to explain these results were stated."—*W. J. Meyer.*

6450. Staats, Arthur W., & Staats, Carolyn K. (Arizona State U.) A comparison of the development of speech and reading behavior with implications for research. *Child Developm.*, 1962, 33(4), 831-846.—Application of operant conditioning principles to the acquisition of speech and reading suggest that both behaviors are quite similar. The greater difficulty in acquisition of reading is attributed to the general inadequacy of available reinforcers and the schedules with which these reinforcers are used. Several researchable problems are suggested.—*W. J. Meyer.*

6451. Switzer, Janet. (Clark U.) Developmental differences in place and name sequence learning in normal, hyperactive, and hypoactive eight and twelve year old boys. *Dissert. Abstr.*, 1962, 22(7), 2482.—*Abstract.*

6452. Wohlwill, Joachim F. (Clark U.) The learning of absolute and relational number dis-

criminations by children. *J. genet Psychol.*, 1962, 101(2), 217-228.—The learning of a generalized relational discrimination on the dimension of number was compared with that of an absolute discrimination, to test the hypotheses that as the mode of representation of the dimension varies from perceptual to abstract to symbolic, speed of relational learning decreases relative to absolute, and that the difference between these 2 tasks decreases with age. Results confirmed only the 1st hypothesis, age differences being limited largely to the symbolic condition, where the trend was towards an increasing dominance of absolute responses with age.—*Author abstract.*

Abilities

6453. Brenner, Anton, & Morse, Nancy C. (Mer-rill-Palmer School, Detroit, Mich.) **The measurement of children's readiness for school.** *Pap. Mich. Acad. Sci. Arts Lett.*, 1956, 41, 333-340.—Data were collected over an 18-month period on a group of 16 private-school pupils who were studied from the time they entered kindergarten with regard to the relationship between one criterion of readiness for school (teacher's rating of children based on their functioning in the 1st grade) and various measures of the children's maturity (including both physical- and mental-maturity indicators taken 6 months or more before the teacher's ratings). Results suggest that certain measures of mental maturity made at the beginning of the kindergarten year "are good predictors of readiness for school."—*S. J. Lachman.*

6454. Gouin Décarie, Thérèse. (U. Montréal, Canada) **Intelligence et affectivité chez le jeune enfant.** [Intelligence and affectivity in the young child.] Neuchâtel, Switzerland: Delachaux & Niestlé, 1962. 215 p.—The aim of this research is to establish the connection between the formation of what the psychoanalysts call "object-relations" in the affective development of the young child and the developmental stages in the field of intelligence found by Piaget through his analysis in 1937. At the same time this investigation would also introduce experimental control into the domain of psychoanalysis. 90 Ss were studied from the age of 3 to 20 months. The working hypothesis was that the stages of Piaget and his school would correspond to the phases of the psychoanalysts. As a 3rd instrument Griffiths' Mental Development Scale was applied. The conclusions state that in spite of some agreement between the 2 theories there are also some oppositions and contradictions. However, the practical conclusions arrived at is "the necessity of bearing in mind the cognitive processes in the study of the affective phenomena and the affective modalities in the study of intellectual phenomena." (206 ref.)—*M. Haas.*

6455. Gréco, Pierre, & Morf, Albert. **Structures numériques élémentaires.** [Elementary numerical structures.] Paris, France: Presses Universitaires France, 1962. 232 p. NF 9.—The development of rudimentary numerical concepts in children is explored in several ways. Gréco provides data from genetic studies on the conservation and nonconservation of number in collections of identical objects with varying degrees of structure. He also describes experiments designed to pinpoint the age at which commutability of terms in simple addition becomes possible. Morf reports 2 experiments concerned with

the degree of serial dependency existing between small, whole numbers used in a stable fashion by children, and the essential factors determining their progressive organization.—*G. H. Mowbray.*

6456. Hawkins, Alice Marie Swallow. (State U. Iowa) **Verbal identification of stimulus components in ambiguously named compounds.** *Disser. Abstr.*, 1962, 22(8), 2882-2883.—*Abstract.*

6457. Lovell, K., Healey, D., & Rowland, A. D. (U. Leeds, England) **Growth of some geometrical concepts.** *Child Developm.*, 1962, 33(4), 751-767.—"Twelve experiments, taken from [Piaget, Inhelder, & Szeminski's] *The Child's Conception of Geometry* [see 34: 8354] and sometimes slightly adapted, were undertaken by a population of English Primary and E.S.N. [educationally subnormal] Special School children. The findings broadly confirm those of Piaget et al., although the numbers of children at the various stages are not always what one might expect from the results obtained from the Geneva children. Once again, it is found that 14- to 15-year-old E.S.N. children have the operational mobility of about an average 7½-year-old. The educational implications of two experiments are briefly discussed."—*W. J. Meyer.*

6458. Maw, Wallace H., & Maw Ethel W. (U. Delaware) **Selection of unbalanced and unusual designs by children high in curiosity.** *Child Developm.*, 1962, 33(4), 917-922.—5th-grade children were rated by their teachers, their peers, and themselves in terms of curiosity. Comparisons were made of high- and low-curiosity children on a paper-and-pencil test consisting of 20 pairs of geometric figures and symbols differing in familiarity and balance. Children in the high-curiosity group chose unbalanced or unusual designs significantly more often than did children in the low-curiosity group.—*W. J. Meyer.*

6459. Yost, Patricia A., Siegel, Alberta Engvall, & Andrews, Julia McMichael. (Pennsylvania State U.) **Nonverbal probability judgments by young children.** *Child Developm.*, 1962, 33(4), 769-780.—"Probability judgments made by 4- and 5-year-old children have been observed in two situations. In the situation in which controls are introduced, amount of reinforcement is increased, and an opportunity for nonverbal decision-making is presented, children tended to make the correct responses significantly more frequently. This result throws doubt on Piaget's contention that young children cannot understand probability, and it demonstrates the importance of using adequately controlled behavioral (nonverbal) situations with suitable reinforcements in studying the cognitive capabilities of young children."—*W. J. Meyer.*

Personality

6460. Abel, Harold, & Sahinkaya, Rezan. (U. Nebraska) **Emergence of sex and race friendship preferences.** *Child Developm.*, 1962, 33(4), 939-943.—"This study examined the emergence of sex and race friendship preferences expressed by preschool children. The sample consisted of 48 4- and 5-year-old white, upper-middle class children attending the University of Nebraska Child Development Laboratory. Photographs of Negro and white boys and girls were used to develop two series of pictures, one for sex and one for race preference. . . . Sex preferences

emerged earlier than race preferences. Race preference is not evident in the 4-year-old group, but is displayed among the 5-year-olds. Both 4- and 5-year-old boys and girls prefer their own sex, but only boys show a definite preference of their own race."—*W. J. Meyer.*

6462. Buhler, Charlotte. (U. Southern California Medical School, Los Angeles) **Genetic aspects of the self.** *Ann. N. Y. Acad. Sci.*, 1962, 96(3), 730-764.—Problems of definition, ontogenesis, frame of reference, and normal and pathological development plague discussions of the self. The self has both core and phenomenal aspects. The development of trust and opportunity for actualization is central to self development. The first response to oneself is perceptual. At 2, the conflict for autonomy begins; at 4, ideals develop. Adolescence is accompanied by a great crisis of self-identity. Identification is in early life by desire, later by accomplishment. Self-assessment is important at the climacteric. Successful accomplishment leads to a sense of fulfillment. Death itself may be regarded as the fulfillment of a fulfilling life. (66 ref.)—*B. S. Aronson.*

6463. Clarke, H. Harrison, & Stratton, Stephen T. (U. Oregon) **A level of aspiration test based on the grip strength efforts of nine-year-old boys.** *Child Developm.*, 1962, 33(4), 897-905.—"This study was designed primarily to investigate methods of grouping 9-year-old boys into defined categories according to their levels of aspiration as interpreted from maximum grip strength efforts. In this process, a number of methods of grouping by performance and aspiration responses were examined; each of these was described and the inter-relations with initial grip strength performances and other responses were determined." The best measure was the 2nd aspiration discrepancy defined as the difference between 2nd level of aspiration and 2nd performance score.—*W. J. Meyer.*

6464. Corman, L. (Faculty Medicine, Nantes) **Le test PN: Pattenoire.** [The PN Test: Black-paw.] Paris, France: Presses Universitaires France, 1961. 324 p. NF 21.—The PN Test is a children's projective technique which, like the CAT, uses the animal on which the child projects his attitudes, thoughts, and conflicts. The author emphasizes the defenses of the ego and introduces a new method of administration which he calls "preference-identification." After the usual themes are given, the S is required to express his affective preferences and to identify himself with one of the protagonists (little pigs) in the picture. The test has been standardized on 200 well adjusted and maladjusted children. The 18 thematic cards are obtainable from Le Centre de Psychologie Appliquée, Paris.—*V. Sanua.*

6465. Cox, F. N. (U. Melbourne, Victoria, Australia) **An assessment of the achievement behavior system in children.** *Child Developm.*, 1962, 33(4), 907-916.—Large samples of 10-11-year-old boys responded to TAT Card 1 which was analyzed on a 4-point scale of achievement. The ratings were significantly associated with school test performance, a measure of general anxiety, and a measure labeled

Household Duties and Responsibilities. In a 2nd study, TAT Card 1 and 3 Michigan Picture Test cards were rated for achievement motivation. This index was related to general anxiety and educational level. It was concluded that these achievement measures were tapping a behavior system or complex combination of drive and habit variables.—*W. J. Meyer.*

6466. Cox, F. N. (U. Melbourne, Australia) **A note of relationships between the Yale Anxiety and Lie scales.** *Educ. Psychol. Measmt.*, 1962, 22(4), 759-762.—The Yale General Anxiety and Test Anxiety scales and the Yale Lie Scale were administered to 848 Australian children. Very high, negative *r*'s were obtained between the General and Anxiety scales with the Lie scale. The author agrees with Sarason in concluding: when the Lie scale is used as a continuous variate it operates like a negatively scored anxiety questionnaire, in which the number of "no" answers instead of the "yes" answers are counted.—*W. Coleman.*

6467. Fancher, Edwin C. (Washington Square Consultation Cent.) **A comparative study of American and Hungarian developmental trends with the Szondi Test.** *J. genet. Psychol.*, 1962, 101, 229-253.—Developmental trends as reflected on the Szondi Test are presented for several American age samples between 3-17 years old, and compared with trends found by Szondi with Hungarian children and adolescents. Similarities between the 2 groups are found for the h, s, hy, k, p, and m factors; and these common trends are compared with studies by other investigators with the Rorschach test. Differences between the Szondi patterns of the American and Hungarian samples are discussed in terms of cultural variables.—*Author abstract.*

6468. Fischer, William Frank. (U. Connecticut) **Sharing in preschool children as a function of amount and type of reinforcement.** *Dissert. Abstr.*, 1962, 22(8), 2871-2872.—*Abstract.*

6469. Gibson, H. B. (U. London, England) **Acquiescence and suggestibility in children.** *Educ. psychol. Measmt.*, 1962, 22(4), 737-746.—An acquiescence score was obtained for 218 children who took the Junior Maudsley Personality Inventory. The Body Sway test was administered to 76 of the group. Since acquiescence declines significantly with age, this regression was partialled out for comparing performance on the 2 measures. For boys there was a significant positive *r* between acquiescence and suggestibility as measured by the Body Sway test. However, the *r* for girls was not significant.—*W. Coleman.*

6470. Graziano, Anthony Michael. (Purdue U.) **A factor analytic investigation of the concept of personality rigidity.** *Dissert. Abstr.*, 1962, 22(7), 2465.—*Abstract.*

6471. Hudgins, Bryce B., Smith, Louis M., & Johnson, Thomas J. (Washington U., St. Louis, Mo.) **The child's perception of his classmates.** *J. genet. Psychol.*, 1962, 101(2), 401-405.—It was hypothesized that perceived arithmetic ability is significantly and positively related to: (a) perceived general ability, (b) acceptance as arithmetic partner, and (c) general social acceptance. The 4th hypothesis was that coefficients of contingency would diminish in the order in which the above hypotheses were

stated. Data were collected by the use of 3 sociometric questionnaires administered to a total of 820 intermediate grade girls and boys enrolled in either urban or suburban public schools. Each of the hypotheses was supported.—*Author abstract.*

6472. Jahoda, Gustav. (Glasgow U.) **Development of Scottish children's ideas and attitudes about other countries.** *J. soc. Psychol.*, 1962, 58(1), 91-108.—A random sample of 144 children aged 6-11 was drawn from 2 Glasgow middle and working class schools respectively, and interviewed. The emergence of children's awareness of other countries and the changes in their likes and dislikes were traced. Preferences began with the exotic, moving later towards the familiar; antagonisms at first followed the alignments of the past war, shifting by 10 or 11 to those of the east-west conflict. Children's images of America and Russia were studied in detail, with special reference to the effect of sputniks and the moon rocket.—*Author abstract.*

6473. Lynn, D. B., & Sawrey, W. L. (U. Colorado School Medicine) **Sex differences in the personality development of Norwegian children.** *J. genet. Psychol.*, 1962, 101(2), 367-374.—Ss were 80 mother-child pairs from a typical sailor district in Norway. The evidence of sex differences was derived from a structured doll-play procedure with the child, having the child draw a family, and from an interview with each mother. A significantly higher proportion of girls than boys drew the mother figure first, largest, and in most detail. A significantly higher proportion of girls than of boys chose the mother-doll more often than the father-doll. Girls chose the boy-doll significantly more often than they chose the girl-doll. The boys chose the boy-doll and the girl-doll almost equally often. The results were discussed in terms of parental identification in boys and girls.—*Author abstract.*

6474. Lynn, Rosalie. (U. Denver) **Sex-role preference and mother-daughter fantasies in young girls.** *Dissert. Abstr.*, 1962, 22(11), 4084.—*Abstract.*

6475. McNeil, Elton B. (U. Michigan) **Social class and the expression of emotion.** *Mich. Acad. Sci. Arts Lett.*, 1956, 41, 341-348.—The hypothesis that middle-class persons take a "conceptual" approach to most of their problems, whereas lower-class persons are "motoric" in their orientation to the world about them was investigated. "Conceptual" refers to symbolic rather than spontaneous contact with the environment; "motoric" implies immediate, bodily expressions of emotion—striking when angry, jumping when joyous, etc. "Middle-class children were able to convey their emotions in a free and dilated manner when expressing themselves conceptually, but were severely constricted when using the body as the vehicle. The reverse findings appeared for lower-class children." Extending the theory to paranoid schizophrenics: "Analysis of the content of delusions revealed nearly twice as many conceptual manifestations for middle-class as for lower-class patients."—*S. J. Lachman.*

6476. Rosenberg, Morris. (National Inst. Mental Health) **The dissonant religious context and emotional disturbance.** *Amer. J. Sociol.*, 1962, 68(1), 1-10.—Contextual dissonance refers to a situation in which the individual's social characteristics differ

from those of the population by which he is surrounded. Data from a sample of high school students suggest that children reared in a dissonant religious context are somewhat more likely to have low self-esteem, to manifest psychosomatic symptoms of anxiety, and to experience depressive affect. Experiences of prejudice appear to contribute to these results. Among those in dissonant contexts, children reared in "culturally dissimilar" neighborhoods appear more likely than others to manifest symptoms of emotional disturbance.—*R. M. Frumkin.*

6477. Stark, Siegfried. (Falkstr. 4, Essen-Holsterhausen, Germany) **Symptom und Geschwisterposition im Spiegel einer Verhaltensbeobachtung.** [Symptom and sibling con-constellation in the mirror of an observation of behavior.] *Prax. Kinderpsychol. Kinderpsychiat.*, 1962, 11(5), 177-187.—In 10 kindergartens, questionnaires with lists of (a) 5 family constellations and (b) symptoms of behavior were distributed. 1006 children were studied. Generally, a sibling constellation with both sexes is better; and, as expected, an "exposed" position as oldest, youngest, or only child causes more problems.—*E. Katz.*

6478. Vogel, Lillian Brown. (Claremont Graduate School) **Anti-social behavior in boys of early elementary school age.** *Dissert. Abstr.*, 1962, 22(9), 3262.—*Abstract.*

6479. Zelig, Rose. (14256 Ventura Blvd., Sherman Oaks, Calif.) **Children's attitudes toward annoyances.** *J. genet. Psychol.*, 1962, 101(2), 255-266.—300 12-year-old children were asked to list all things that annoy, irritate, and bother them, and the material was arranged in separate tests for boys and girls. These tests were given to 285 other children of the same age. The children's reactions to items under health and appearance, hobbies and interests, food, games and amusements, and fears are reported here. Significantly more girls "hate much" to have accidents, scarlet fever, an operation, headaches, stomach aches, to get hurt, be dirty, wear torn clothing, or drink milk. Significantly more boys "hate much" to go to operas, take piano lessons, go to concerts, plant flowers. The findings indicate that there are many annoying situations in children's daily experiences. Girls are more often and more extremely annoyed than boys. Oversensitiveness to an overstimulating and complex environment may contribute to children's emotional instability and unnecessary annoyances should be avoided.—*Author abstract.*

Parent-Child Relations

6480. Apperson, Olive Louise Behrens. (U. Denver) **A comparison of parental attitudes with certain characteristics of their children considered relevant to adjustment.** *Dissert. Abstr.*, 1962, 22(11), 4078.—*Abstract.*

6481. Buxbaum, Edith. **Understanding your child: A guidebook for parents.** New York: Grove, 1962. xv, 204 p. \$.50 (paper).—A paperback edition, originally published in 1949 by International Universities Press as *Your Child Makes Sense*.—*E. Borrowman.*

6482. Casler, Lawrence. (Brooklyn Coll.) **Maternal deprivation: A critical review of the literature.** *Monogr. Soc. Res. Child Developm.*, 1961, 26

(2), 64 p.—Questioning the thesis that emotional, physical, and intellectual malfunctioning in institutionalized children is attributable to the deprivation of maternal love, the author demonstrates that it is also possible to interpret results of relevant studies in the light of the hypothesis that this malfunctioning is due to stimulation deprivation. Loss of maternal love is shown probably to have ill effects only after specific affective responsiveness has been achieved. Recent neuroanatomical findings, animal studies, human studies, and the cultural approach are examined to explain why perceptual stimulation is apparently crucial to normal development. (268-item bibliogr.)—*J. S. Braun.*

6483. Clifford, Edward. (Child Research Council, Denver, Colo.) **Expressed attitudes in pregnancy of unwed women and married primigravida and multigravida.** *Child Developm.*, 1962, 33(4), 945-951.—"3 groups of pregnant women, 50 unwed, 50 married primigravida and 50 married multigravida were given the Pregnancy Research Questionnaire (PRQ)." The groups differ among themselves on a variety of dimensions. There was a significant tendency for psychosomatic anxiety indices, nausea, and sleep disturbances as recalled states before pregnancy to be related to the appearance of these factors during pregnancy. The stress of pregnancy apparently accentuates predispositional factors present before pregnancy.—*W. J. Meyer.*

6484. Cox, F. N. (U. Melbourne, Victoria, Australia) **An assessment of children's attitudes towards parent figures.** *Child Developm.*, 1962, 33(4), 821-830.—The development of positive social relationships is related to positive attitudes towards the same-sex parent. To test the hypothesis a measure of attitude toward same-sex parent was developed. The measure (responses to 6 TAT cards) was shown to have S reliability, high interscorer agreement, and validity. A significant relationship between attitude toward same-sex parent and peer acceptance was found.—*W. J. Meyer.*

6485. Dittrichová, J. (Inst. Care Mother & Child, Prague, Czechoslovakia) **Nature of sleep in young infants.** *J. appl. Physiol.*, 1962, 17, 543-546.—Criteria of ocular reactions, bodily activity, and respiration were used to distinguish 4 stages: deep sleep, sleep with closed eyes but greater bodily activity and irregularity of respiration, light sleep in transition to waking, and the waking state. It is not the duration of deep sleep which decreases in early life, as usually reported, but the duration of the transitional state.—*D. R. Peryam.*

6486. Grinder, Robert E. (U. Wisconsin) **Parental childrearing practices, conscience, and resistance to temptation of sixth-grade children.** *Child Developm.*, 1962, 33(4), 803-820.—In a follow-up study, 70 boys and 70 girls—from the original group described by Sears, Macoby, and Levin (see 31: 4442) when the children were 5 or 6 years old—were tempted to transgress rules. Specific predictions were derived from Sears' socialization antecedents. High standards for neatness and obedience were related to boys' resistance to temptation; among girls, resistance to temptation was associated with sex training and pressures in terms of weaning and bowel training. Resistance to temptation at age 11-12 was associated with admission of transgressions at age

5-6 in boys and voluntary confession at age 5-6 in girls.—*W. J. Meyer.*

6487. Hess, Robert D., & Torney, Judith V. (U. Chicago) **Religion, age, and sex in children's perceptions of family authority.** *Child Developm.*, 1962, 33(4), 781-789.—The perception of authority structure within the family was investigated using 1861 children, ages 7-15. "Girls reported the father to be boss in the family significantly less frequently than boys and reported both parents were equal in power significantly more frequently. The percentage of children reporting father as boss decreased in both sexes with age, while the percentage of children reporting both as boss increased. There was no difference in children's perception by social class." Catholic children reported a single parent as boss more frequently than Protestant children.—*W. J. Meyer.*

6488. Huntingford, Peter J. (St. Thomas Hosp., London, England) **Attitudes of doctors and midwives to breast-feeding.** *Developm. Med. Child Neurol.*, 1962, 4(6), 588-594.—Questionnaire findings on 458 replies received (76% return) from general practitioners, obstetricians, pediatricians, midwives, and health visitors are reported. "Most of these workers consider that breast-feeding is valuable, particularly for the psychological well-being of both mother and child, and that it should be the method of choice for feeding a baby provided the mother is willing and she is helped in a sympathetic way to establish lactation. The factors responsible for the present high rate of failure of women to breast-feed include modern social conditions, indifference of both mothers and attendants to breast-feeding, and lack of agreement on the details of its management."—*T. E. Newland.*

6489. Hurley, John R., & Laffey, John J. (Michigan State U.) **Influence of a conventional child psychology course upon attitudes toward children.** *Pap. Mich. Acad. Sci. Arts Lett.*, 1957, 42, 299-306.—The "degree to which rejecting and overprotecting attitudes toward children were altered during a conventional child psychology course" was investigated via measures of rejection and overprotection described. "Comparison of the pre- and post-course scores of 19 college students on these measures disclosed a significant reduction, both in terms of average score and in terms of number of students obtaining lower scores, in the rejection index at the course end. No corresponding change was found in the overprotection index." Evidence supporting the view that overprotection represents, in part, a more indirect mode for the expression of rejection was provided by the large positive correlation between the rejection and overprotection scores.—*S. J. Lachman.*

6492. McDonald, R. L. (Medical Coll. South Carolina) **Intrafamilial conflict and emotional**

disturbance. *J. genet. Psychol.*, 1962, 101(2), 201-208.—The purpose of this study was to assess the differences between parents of emotionally disturbed children and the parents of normal children with respect to self-descriptions, attitudes toward each other, and attitudes toward their children by means of the Leary Interpersonal Check List. The parents of 10 emotionally disturbed children free of organic damage, of at least normal intelligence, and of elementary school age, rated self, spouse, child, and ideal as did the parents of 10 normal children who were matched with the disturbed children according to sex, age, and intelligence. To insure matched groups, the educational status of the parents and the socioeconomic status of the fathers were also controlled. The results indicated that the parents of the disturbed children (a) rejected their own behavior more often than did parents of normal children; (b) described their children as distrustful, self-effacing, and dependent more frequently than parents of normal children; (c) devaluated the personalities of their spouses and children more frequently than parents of normal children; and (d) were more frequently disidentified with their children than were parents of normal children. The parents of disturbed children also tended to disidentify with each other more than did parents of normal children.—*Author abstract.*

6493. Nichols, Robert C. (Purdue U.) A factor analysis of parental attitudes of fathers. *Child Developm.*, 1962, 33(4), 791-802.—"A factor analysis of 25 scales of the Parental Attitude Research Instrument for fathers yielded five factors, which were surprisingly comparable to factors found by other investigators in parental attitudes of mothers. Factor scales were developed to measure the three largest factors."—*W. J. Meyer.*

6506. Kasper, Sidney. (U. Chicago) Measurement of adjustment in adolescents: An extension of personal construct theory and methodology. *Psychol. Monogr.*, 1962, 76(6, Whole No. 525), 32 p.—A study on the validity and reliability of a modified Role Construct Repertory Test (RCRT) with some particular emphasis on its applicability to adolescent Ss. Based upon teachers' ratings or admission to selected treatment centers for evaluation or treatment, 3 groups of adolescents were assigned as: (a) well adjusted (WA), (b) poorly adjusted (PA), or clinicals (CL). The latter group contained no psychotic, brain-damaged, or intellectually deficient Ss. All groups were subjected to the same test procedures. The results obtained led to a wide variety of conclusions. Some of the more significant of these are: (a) well adjusted Ss on the whole experienced less total threat than PA and CL Ss; (b) WA Ss were less defensive than other Ss; (c) WA Ss tended to feel underrated, but not as markedly as PA Ss; (d) WA showed greater stability than other Ss. Further use of the modified RCRT in research is suggested.—*M. A. Seidenfeld.*

6507. National Committee for Children and Youth. Report of followup activities: Conference on Unemployed, Out-of-School Youth in Urban Areas. Washington, D. C.: NCCY, 1962. iii, 64 p. \$1.00.—(See 37:6508) Summary descriptions of activities and programs (classified according to city, state, and organization) reported in a follow-up to conference delegates.—*L. S. Kogan.*

6508. National Committee for Children and Youth. Social dynamite: The report of the Conference on Unemployed, Out-of-School Youth in Urban Areas. Washington, D. C.: NCCY, 1961. xiii, 265 p. \$2.00.—Summaries of speeches, work-group discussions, and recommendations from a conference held in May 1961. An appendix provides a bibliography of relevant publications and brief descriptions of over 100 programs in the United States dealing with the problem.—*L. S. Kogan.*

155-160.—A simple experiment is described in which 25 secondary school students, aged 12-14, are tested for recent memory of 20 visual forms by a recognition method. Trials and time to reach the criterion of recognition of all 20 forms from among these and 20 other forms bore little relation to each other. Individual differences among Ss are discussed.—*J. T. Cowles.*

6511. Steinwachs, Friedrich. (Düsseldorf, Germany) Körperlich-seelische Wechselbeziehungen in der Reifezeit. [Changes in physical-mental relationships during maturity.] Basel, Switzerland: Karger, 1962. 263 p.—635 boys and girls 13-17 years of age were classified into physical groups on the basis of a large series of measurements including anthropometric measures, height, weight, and primary and secondary sex characteristics. The resulting groupings included such factors as acceleration-retardation, synchronic-asynchronic and hypoplastic-displastic characters, and variations of Kretschmer's constitutional types. Autonomic nervous system function was measured by the galvanic skin response. Psychological performance was based on the psychomotor writing curve developed by Steinwachs, the Kraepelin-Pauli curve, and physiognomic tests of Thomae. The results showed statistically significant correlations between physical types and mental function only when multiple dimensions of physique are considered. Implications for the understanding of personality and its application to the areas of school, clinical, genetic, and criminal psychology are discussed. (246-item bibliogr.)—*J. L. Yager.*

SOCIAL PSYCHOLOGY

6517. Bennis, Warren G., Benne, Kenneth D., & Chin, Robert. (Eds.) (Massachusetts Inst. Technology) **The planning of change: Readings in the applied behavioral sciences.** New York: Holt, Rinehart & Winston, 1961. xiii, 781 p. \$8.50.—As a sequel to Benne and Muntyan's *Human Relations in Curriculum Change* (1951), this book of 84 readings deals with "the problems of various professions of social practice, not merely those of teachers." The editors preface each major group of readings with extensive theoretical and critical discussion of the definition and philosophy of planned social change; its roots, methods, outcomes, and control. The readings then amplify and relate these topics to the individual, family, community, and such cultural institutions as religion, public health, industry, and statesmanship.—*R. Lawner*.

6518. Berkowitz, Leonard. (U. Wisconsin) **Aggression: A social psychological analysis.** New York: McGraw-Hill, 1962. xv, 361 p. \$7.95.—Research is cited from ethnology, biology, personality theory, social psychology, sociology, and mass communication to update and modify formulations advanced by Dollard, Miller, and their colleagues in the late 1930s. Areas considered include: instinct concepts of aggression; the frustration-aggression hypothesis; situational determinants of the strength of the instigation to aggression; factors affecting inhibition of aggression; determinants of the nature and target of aggressive response to frustration; displacement of aggression in intergroup conflicts and scapegoating; aggression aroused by opposing belief systems and competitive situations; the catharsis hypothesis; the effects of violence in television, movies, and comic books; characteristics and development of aggressive personalities; and antisocial acts of aggression such as crime, suicide, and homicide.—*C. H. Miley*.

6519. Kolb, William L. (Carleton Coll.) **Images of man and the sociology of religion.** *J. scient. Stud. Relig.*, 1961, 1, 5-29.—There is a Judiac-Christian image of man which may be better suited to the ordering of sociological data than those models currently in use. The central elements of this image are: (a) the concept of the conditional will (freedom); (b) certain universal conditions of man's situation and the needs that are generated thereby; (c) the double-orientation to the nonempirical and other men (I-Thou) may be the impossible possibility, a doctrine of relativity with a dynamic; and (d) its orientation to the reason and finiteness of man.—*O. Strunk, Jr.*

6520. Krech, David; Crutchfield, Richard S., & Ballachey, Egerton L. (U. California, Berkeley) **Individual in society: A textbook of social psychology.** New York: McGraw-Hill, 1962. x, 564 p. \$7.95.—A major revision of Krech and Crutchfield's *Theory and problems of Social Psychology* (see 23: 1723). Part I discusses "three basic psychological factors—cognition, motivation, and interpersonal response traits—which shape and reflect the influence of interpersonal behavior events." Part II considers the nature, measurement, and formation of attitudes and attitude change. Part III describes the social and cultural habitat of man. It considers "the nature and uses of language, the effects of social class, status-strivings, social mobility, cultural norms, values, and beliefs." Part IV considers the group—how it is organized, the nature of group leadership, what makes a group effective, and the impact of the group on the individual.—*C. H. Miley*.

Sci.*, 1962, 7(4), 474-476.—"This paper examines a government agency as a behavioral system and tests certain hypotheses derived from the application of systems theory to this agency." (17 ref.)—*Journal abstract*.

6522. Lindner, Robert. **Must you conform?** New York: Grove, 1961. xi, 210 p. \$.60 (paper).—A paperback edition of a book originally published in 1956.

6523. Loomis, C. P., & Loomis, Zona K. (Michigan State U.) **Modern social theories.** Princeton, N. J.: Van Nostrand, 1961. xxiv, 720 p. \$9.25.—The theoretical writings of Howard Becker, Kingsley Davis, George Homans, Robert Merton, Talcott Parsons, Pitirim Sorokin, and Robin Williams were subjected to a comparative analysis by the authors. The analytic scheme employed by them distinguished elements (belief, sentiment, rank, power), processes (tension-management, evaluation), and conditions of action (time, territoriality, and size). Each theorist was discussed individually and his ideas were analyzed in terms of how he handled each of the elements, processes, and conditions of action in social systems. A final chapter compared all 7 men in their treatment of social change. The volume contained complete bibliographies of all men except Sorokin, and the chapters on each theorist were criticized by him prior to publication.—*K. E. Davis*.

6524. Misra, Hemkanta. **Use of psychological techniques in social surveys in India.** *Indian J. soc. Wk.*, 1961, 22(3), 189, 192.—The problems of using unstructured interviews, structured questionnaires, and projective tests in the scientific investigation of a variety of subject groups are briefly discussed.—*R. Schaefer*.

6525. Oliver, R. T., & Barbara, Dominick A. **The healthy mind in communion and communication.** Springfield, Ill.: Charles C Thomas, 1962. xi, 166 p. \$.65.—While written essentially for a non-professional audience, this book covers its main topics with relative completeness in an interesting anecdotal style. Part I deals with thinking and the relationship of the individual to society, Part II with listening and the role of listening in psychotherapy, Part III with speaking and problems of ethics and values.—*S. E. Pulver*.

6526. Osgood, Charles E. *An alternative to war or surrender.* Urbana, Ill., Univer. Illinois Press, 1962. 183 p., \$1.45 (paper).—An analysis of the psychological paradoxes of human thinking under the stress of cold war and the threat of "hot" war, and a plan for reducing international tensions without surrendering to Communist pressures. The plan for "Graduated Reciprocation in Tension-Reduction" (GRIT) calls for a series of unilateral steps toward disarmament, each fully announced and accompanied by an explicit invitation to Russia to reciprocate in some form.—*C. T. Morgan.*

6527. Silberman, Leo. *Air social surveys: Principles and developments.* *Rural Sociol.*, 1962, 27 (4), 475-483.—Air photography as a tool for studies in the social sciences and what data it might supply.—*H. K. Moore.*

6528. Stone, Philip J., Bales, Robert F., Namen-wirth, J. Zvi, & Ogilvie, Daniel M. (Harvard U.) *The general inquirer: A computer system for content analysis and retrieval based on the sentence as a unit of information.* *Behav. Sci.*, 1962, 7(4), 484-498.—A description of a system for dealing with nonnumerical data. The "general inquirer" has not been intended as an automatic data processor, but as a system for aiding an investigator to organize his procedures and make them explicit. The discussion is divided into 4 topics: dictionary procedures, retrieval operations, data preparations, and special procedures for syntax identification. Specific format rules and procedural details are described in an appendix.—*J. Arbib.*

6529. Stoodley, Bartlett H. (Ed.) *Society and self: A reader in social psychology.* New York: Free Press Glencoe, 1962. xviii, 713 p. \$7.50.—A collection of recent readings in social psychology with the emphasis on social structure. There are 50 selections presented under 8 major categories: "The Concept of Social Structure," "Aspects of Psychosocial Process," "The Uses of Social Structure," "Problems of Social Nondefinition (anomie)," "Self Responses to Social Structure," "Social Aspects of Self Structure," "Self-Feedback Process," and "Postulates and Models." Each of the major sections has a brief introduction and concludes with a list of selected readings.—*E. D. Lawson.*

CULTURE & CULTURAL RELATIONS

6530. Arkoff, Abe; Meredith, Gerald, & Iwahara, Shinkuro. (U. Hawaii) *Dominance-deference patterning in motherland-Japanese, Japanese-American, and Caucasian-American students.* *J. soc. Psychol.*, 1962, 58(1), 61-66.—The research instrument was a specially devised dominance-deference questionnaire composed of 20 items. Analysis of the results indicated that sex and ethnic status were important determiners of test-score differences. The test scores of the several sex and ethnic groups were compared and discussed.—*Author abstract.*

6531. Berndt, Ronald M. *Excess and restraint.* Chicago, Ill.: Univer. Chicago Press, 1962. xvi, 474 p. \$8.95.—A study of social control of people of 4 neighboring language groups in eastern New Guinea observed (1951-53) at the time they were beginning to come under administrative control of Australia. Main topics deal with conflict and cooperation, order

and disorder, and conformity and nonconformity in an ongoing society confronted with sudden adjustment difficulties. Extensive ethnographic data detail, the social structure and organization, the mythological background of social action, and the functions served by ritual and festivals are included. Socialization practices are comprehensively presented with attention to foci of dissension sexuality, and aggression. Coercive controls are described in the context of suicide, sorcery, and warfare, plus chapters on cannibalism and intradistrict conflicts. Judicial procedures cover native courts and external controls. (381-item bibliogr.)—*W. B. Hall.*

6532. Bloom, B. L. *Ecologic factors in intelligence test performance.* *Soc. Process*, 1961-62, 25, 67-70.—The superiority of a Hawaiian hospitalized group compared with a Connecticut sample on WAIS performance scales suggests the "presence of a general motoric orientation in this sample . . . consistent with recent formulations regarding the existence of motoric vs. conceptual life styles."—*E. L. Gaier.*

6533. Bloomgarden, Lawrence. (American Jewish Committee, NYC) *A current evaluation of the effect of discrimination and self-segregation on Jewish occupational choice.* *J. Jewish communal Serv.*, 1962, 39(1), 91-97.—A review of the patterns of occupational choice of Jews with evaluation of some of the more predominant factors that have influenced them. Changes taking place within the structure of American society are acting to broaden opportunities. Among college students, Jews, Protestants and Catholics seem to view the importance of getting ahead with about the same degree of conviction. Jews seem somewhat less likely to follow the organization man career line than those of other faiths. Discrimination and self-segregation are still in evidence. Changes in the technological needs of management may reduce discrimination in this field where it has been most predominant.—*M. A. Seidenfeld.*

6534. Bonte, M. (Yale U.) *The reaction of two African societies to the Müller-Lyer illusion.* *J. soc. Psychol.*, 1962, 58(2), 265-268.—Over 60 years ago Rivers reported that the Todas were less susceptible to the Müller-Lyer illusion than Europeans. When apparatus similar to his based on the psychophysical method of adjustment or average error was employed, a sample of 50 Bashi African and 100 Mbuti pygmies was no more susceptible than a group of Europeans. River's finding, however, was replicated when 400 Bashi and 72 Europeans were compared through a series of 15 drawings prepared by Herskovits et al. (method of constant stimuli to locate an indifference zone). Neither of these nor Rivers' studies have isolated the precise variables which produce differences in reactions to the illusion, but clearly the stimulus itself and the measurement procedure play an important role.—*Author abstract.*

6535. Boquet, Susana. (Columbia U.) *Acculturation of Puerto Rican children in New York and their attitudes toward Negroes and whites.* *Dissert. Abstr.*, 1962, 22(11), 4105-4106.—*Abstract.*

6536. Coelho, G. V., Sellitz, Claire; Cook, S. W., Bjerstedt, A., Bailyn, Lotte; Kelman, H. C., & Schild, E. O. (National Inst. Mental Health, Bethesda) *Impacts of studying abroad.* *J. soc. Issues*, 1962, 18(1), 1-89.—This entire issue of the journal is devoted to the theoretical and empirical

considerations arising from international exchanges of students. Portions of the issue are devoted to elucidating principles of social perception and social learning in situations involving cross-cultural contacts while other portions discuss the adaptive social behavior occasioned when one finds oneself in an alien social environment. Implications and recommendations for student exchange programs are drawn and presented.—*A. Barclay.*

6537. Corke, Patricia Perry. (U. Houston) **A comparison of frustration-aggression patterns of Negro and white southern males and females.** *Dissert. Abstr.*, 1962, 22(8), 2870.—*Abstract.*

6538. Devereux, E. C., Jr., Bronfenbrenner, Urie, & Suci, G. J. **Patterns of present behavior in the United States of America and the Federal Republic of Germany: A cross-national comparison.** *Int. soc. Sci. J.*, 1962, 14(3), 488-506.—These findings suggest that American 6th-graders view their parents as imposing less direct discipline but expressing less affection, more disapproval, and more pressure for achievement in contrast to the sample of German parents described by their children. The American father plays a much weaker role than the German father, while the American mothers are characterized by a greater tendency toward criticism. Less control also seems to characterize the American parent, in terms of restrictions imposed on the children. It is speculated that the greater affection and control in the German family affects boys in being less independent, less self-directed, and less interested in peer-group interactions whereas the attitudes of the American parent seems to produce more achievement orientations among their male children. Alternative explanations are offered as a cautionary note to these speculations.—*A. Barclay.*

6539. Fenz, Walter D., & Arkoff, Abe. (U. Hawaii) **Comparative need patterns of five ancestry groups in Hawaii.** *J. soc. Psychol.*, 1962, 58(1), 67-89.—This study compared need patterns of male and female high school students of Caucasian, Chinese, Filipino, Hawaiian, and Japanese descent as measured by the Edwards Personal Preference Schedule. The Caucasian profile proved to be singular—for many of the needs there seemed to be a Caucasian and a non-Caucasian level of expression. The profiles of the several female groups were more similar than those for the male groups. There was some suggestion of an acculturational process among the students of Japanese ancestry.—*Author abstract.*

6540. Goff, Regina M. (Morgan State Coll.) **Psychology and intercultural interaction.** *J. soc. Psychol.*, 1962, 58(2), 235-240.—Successful intercultural interaction requires recognition of the interdependence of cultural and psychological elements inherent in a total social operation. The quality or nature of interaction is a function of any present set of cultural conditions associated with psychological determinants which serve as commutators, to change the course of compatible ends in view, or as satisfiers to prevailing conditions.—*Author abstract.*

6541. Hill, Reuben. (U. Minnesota) **Cross-national family research: Attempts and prospects.** *Int. soc. Sci. J.*, 1962, 14(3), 425-451.—A review of current and contemplated cross-national research on family, pointing out the difficulties of obtaining such data and the problems involved in attempting cross-

cultural research in this area of study. (58 ref.)—*A. Barclay.*

6542. Mann, J. W. (U. Natal) **Race-linked values in South Africa.** *J. soc. Psychol.*, 1962, 58(1), 31-41.—White and nonwhite South African students wrote commentaries on 7 anecdotes, each of which posed a social dilemma. Analysis brings out these race-linked value differences, the nonwhite inclining more towards community service above privatism, public welfare before religious scruples, and full democracy for all circumstances. The differences could be attributed to different cultural traditions, although cultural differences between races were minimized in this study. An explanation in terms of stratification is feasible. Whatever the explanation, the race-linked values are likely to affect the prevailing stratification in South Africa.—*Author abstract.*

6543. Narroll, Raoul. (Northwestern U.) **Data quality control: A new research technique. Prolegomena to a cross-cultural study of culture stress.** New York: Free Press Glencoe, 1962. 198 p. \$5.00.—The quality of ethnographic data may be related to whether their reporter (a) mentions specific cases (rather than only generalizations), (b) lived among the people studied, (c) stayed with the people for more than a year, (d) knew the native language, (e) was an ethnographer or native scholar (rather than a missionary or government official), and (f) reports explicitly on the characteristics in question (such that little judgment need be employed in their interpretation). Quality of 4 measures of culture stress was assessed by computing Yule's Q between them and each of the above 6 quality conditions. Among 17-32 (depending upon the measure) previously studied societies, reported occurrence of drunken brawling was related substantially ($Q > .50$) to explicitness of reporting (condition f); defiant homicide to (c), (d), and negatively to (f); protest suicide to (d), and negatively to (a) and (f); witchcraft attribution to (b), (c), (d), and negatively to (e). When frequency of occurrence is substantially related to quality conditions, statistical procedures should be employed to control for variation in the latter.—*J. Sawyer.*

6544. Oommen, T. T. **Social factors in mobilizing small savings in India.** *Indian J. soc. Wk.*, 1961, 22(3), 197-202.—Buying prestige jewelry and paying for ritualistic ceremonies are examples of significant hoarding and unproductive spending. Ways and means of changing cultural values and norms to produce more healthy economic growth are suggested.—*R. Schaef.*

6545. Park, J. E. **Human factors in rural sanitation.** *Indian J. soc. Wk.*, 1961, 22(3), 193-195.—Methods of implementing health education aims in order to close the gap between knowledge and application are outlined.—*R. Schaef.*

6546. Rao, N. A. Hanumantha. **A study on social distance with particular reference to major caste groups of the coastal tract of North Kanara.** *J. Karnatak U.*, 1960, 4, 75-105.—A modified Social Distance scale was used with 407 students from 8 caste groups inhabiting the coastal areas of India. The scale asked 4 questions concerning: allowing one of another caste to stay in one's locality, accepting one of another caste as a neighbor, taking food into

the house of another caste and marrying into another caste. Results show that most of the Brahmins are ready to allow non-Brahmins to live in the neighborhood, but are not ready to take food into the houses of, or marry among, non-Brahmins. Among non-Brahmins, Nadvars and Harikantras are most conservative; and among Brahmins, Haviks are most conservative. Lower caste groups want to marry into higher caste groups. Girls were found to be more conservative than boys.—*U. Pareek.*

6547. Rosenblatt, Paul C. (Northwestern U.) **Functions of games: An examination of individual difference hypotheses derived from a cross-cultural study.** *J. soc. Psychol.*, 1962, 58(1), 17-22.—In a probe of the validity of generalizing from cross-cultural studies to the level of intracultural individual differences, hypotheses about the relationship between values and participation in games were derived from a cross-cultural study. Because the data do not support the hypotheses, it is concluded that individual difference generalizations based on cross-cultural findings are of limited validity.—*Author abstract.*

6548. Schull, W. J., Yanase, T., & Nemoto, H. (U. Michigan) **Kuroshima: The impact of religion on an island's genetic heritage.** *Hum. Biol.*, 1962, 34(4), 271-298.—Differences between Buddhists and Catholics in a Japanese island population were found in respect to: "(1) reproductive performance, (2) frequency of visual handicap and abnormal color perception, and (3) ABO phenotype frequencies."—*P. Swarts.*

6549. Schwarzweller, Harry K., & Brown, James S. (U. Kentucky) **Education as a cultural bridge between eastern Kentucky and the great society.** *Rural Sociol.*, 1962, 27(4), 357-373.—Education seems to be the chief vehicle for transmitting the dominant culture to this rural area.—*H. K. Moore.*

6550. Singh, Paras Nath, & Rettig, Salomon. (Ohio State U.) **Cross-cultural differences in habitual response preferences as an index of anxiety.** *J. soc. Psychol.*, 1962, 58(1), 9-15.—The study measured differences in culturally conditioned tendencies to prefer certain responses over others. It was hypothesized that Indian students prefer responses which signify low anxiety, compared to American students, and that this preference is inversely related to stimulus structure. A questionnaire, consisting of 20 structured, 20 semistructured, and 20 unstructured items, was administered to 50 American and to 150 Indian graduate students in India and in the United States, in the English and Hindi language. The results support both hypotheses. Indian students significantly prefer the "yes," "true," "agree," and "satisfied" responses, irrespective of stimulus content, language, and place of residence. It was concluded that these results reflect differential anxieties associated with the 2 different cultures.—*Author abstract.*

6551. Tedeschi, James T., & Kian, Mohamed. (U. Miami) **Cross-cultural study of the TAT assessment for achievement motivation: Americans and Persians.** *J. soc. Psychol.*, 1962, 58(2), 227-234.—1 group from each culture was presented the TAT under relaxed conditions and 1 group from each culture was given the TAT under aroused conditions. The results show that Americans and Persians are not significantly different in strength of need for achieve-

ment under either condition of testing. Persians under aroused conditions scored higher than Persians tested under relaxed conditions; the American groups did not differ from one another. A general perusal of the TAT protocols gave indications of differences in the thought patterns between the 2 cultural groups.—*Author abstract.*

6552. **United Nations Educational, Scientific, and Cultural Organization. Race and science.** New York: Columbia Univ.: Press, 1961. 506 p. \$5.00.—11 monographs by natural and social scientists participating in UNESCO's program on race and culture. The concept of race is defined, and our present knowledge of race differences and racial prejudice is presented. The relationship of race relations to mental health, in general, and psychology, in particular, is analyzed.—*C. W. Page.*

6553. Wallace, A. F. C. (U. Pennsylvania) **Culture and personality.** New York: Random House, 1961. x, 213 p. \$1.95 (paper).—This volume is devoted not to a descriptive summary of empirical studies in the field but to a critical analysis of the logic and methods of previous research and theorizing. The author deals with the problem of formulating operationally meaningful assertions, the different views of the relation between culture and personality, the minimum cognitive conditions for a stable cultural system, the relation between the evolution of culture and the evolution of the brain, the cultural distribution of personality types and mental illnesses, and the psychology of cultural change. In addition to the author's penetrating logical and methodological comments, the book contains interesting empirical material on revitalization movements which has relevance to processes of social influence and dramatic changes in personality.—*K. E. Davis.*

SOCIAL STATUS & STRUCTURE

6554. Bieri, J., Lobeck, Robin, & Plotnick, H. (2 E. 91 St., NYC) **Psychosocial factors in differential social mobility.** *J. soc. Psychol.*, 1962, 58(1), 183-200.—Varying degrees of social class mobility, measured by father-subject discrepancy in education and occupation, are found among adult males. Demographic variables associated with greater upward mobility are: Jewish religion (vs. Catholic), foreign-born status of father, and lower-class background. Lower feelings of dominance are associated with lower class background and, among Jewish Ss, with greater mobility. Equating groups for education, Jewish Ss show superior vocabulary ability and more frequently enter occupations requiring verbal skills. Extreme religious differences are found in acceptance of authority, but only among Jewish Ss is authority acceptance inversely related to years education (and thus to class status). Mobility is discussed in relation to intellectual ability, need achievement, compensatory motivations, and the supportive role of cultural values.—*Author abstract.*

6555. Butman, Jean Woodward. (U. Michigan) **Social class and peer evaluation.** *Dissert. Abstr.*, 1962, 22(7), 2484-2485.—*Abstract.*

6556. Coser, Lewis A. (Brandeis U.) **Some functions of deviant behavior and normative flexibility.** *Amer. J. Sociol.*, 1962, 68(2), 172-181.—This paper calls attention to the positive function of

deviance in social structures. Among the latent functional contributions are the role of the deviant in arousing the community to the consequences of the breach of its norms, and the fact that deviance may be considered the very ground of normalcy. Various structural and situational circumstances which lead the group to tolerate or even to foster deviance are considered. Criminal deviance is distinguished from nonconformist innovating behavior; and various types of innovating departures from normalcy are considered from the dual viewpoint of structurally induced motivation and of impact on group structure.—*R. M. Frumkin.*

6557. Gerber, Irwin. (New York U.) **The effects of the Supreme Court's desegregation decision on the group cohesion of New York City's Negroes.** *J. soc. Psychol.*, 1962, 58(2), 295-303.—This investigation involved 2 areas of research. In one, the effect of the desegregation decision on the group cohesion of New York City's Negroes was studied. In the other, the researcher studied the differences of group cohesion between 3 Negro socioeconomic classes. 1500 questionnaires were mailed. The questionnaire was composed of 7 items designed to measure group cohesion. These criteria were derived from a series of interviews with Negro race leaders. A return of 260 responses was used as the working sample. The results were: there is a significant increase for the change of group cohesion for New York City's Negroes, the upper-middle-middle-class and the lower-middle-class showed an increase for group cohesion without a significant difference between them, between the upper-middle-middle-class and the lower class the only significant difference was for the criterion of sensitivity, between the lower-middle-class and the lower class there was no significant difference in change for group cohesion.—*Author abstract.*

6558. Mehlman, B., & Warehime, R. G. (San Fernando Valley State Coll.) **Social class and social desirability.** *J. soc. Psychol.*, 1962, 58(1), 167-170.—If social class has a tremendous influence upon individual personality development and value system formation then it seems reasonable to expect that persons from the various social classes should respond differently to a measure such as the Social Desirability scale. 218 males and females were administered the Hollingshead-Redlich Index of Social Position and the Edwards Social Desirability scale. There were 22, 32, 72, 62, and 30 persons in Social Classes I, II, III, IV, and V, respectively. The analysis of variance *F* for social class differences was not significant at the .05 level, although it did approach significance at the .10 level. Several hypotheses are discussed for these results, which tend to agree with what has been found by other studies in this area.—*Author abstract.*

6559. O'Dea, Thomas F. (U. Utah) **Five dilemmas in the institutionalization of religion.** *J. scient. Stud. Relig.*, 1961, 1, 30-41.—The following 5 dilemmas of the institutionalization of religions are discussed: (a) mixed motivation, (b) symbolism (objectification versus alienation), (c) administrative order (elaboration versus effectiveness), (d) delimitation (concrete definition versus substitution of letter for spirit), and (e) power (conversion versus coercion).—*O. Strunk, Jr.*

6560. Shryrock, Henry S., Jr. (United States Bureau Census, Washington, D. C.) **Some results of the 1960 census of the United States.** *Rural Sociol.*, 1962, 27(4), 460-472.—"For the first time in our history, a larger percentage of negroes than of whites are urban residents. . . . The slight decline in median age was the first in our history."—*H. K. Moore.*

6561. Townsend, Peter. **The meaning of poverty.** *Brit. J. Sociol.*, 1962, 13(3), 210-227.—It is shown that the concept of poverty in the behavioral sciences has tended to lack objectivity because it has been defined in absolute terms. The author's thesis is that poverty is a relative concept and that it can only be defined in relation to the material and emotional resources available at a particular time to the members either of a particular society or different societies. One serious error has been to narrow attention to the preservation of physical efficiency and by implication to assume that physical efficiency of individuals can be divorced from their psychological well-being and the organization and structure of society. What most people would call poverty in one society is often comparative affluence in another. Individuals and families whose resources, over time, fall seriously short of the resources commanded by the average individual or family in the community in which they live, whether the community is a local, national, or international one, are in poverty. Employing this more objective theory of poverty, there seems to be a substantial amount of poverty in Britain.—*R. M. Frumkin.*

ATTITUDES & OPINIONS

6562. Adams, James Ray. (Columbia U.) **Attitudinal ambivalence and choice of contraceptive method.** *Dissert. Abstr.*, 1962, 22(8), 2894.—*Abstract.*

6563. Allport, G. W. (Harvard U.) **Prejudice: Is it societal or personal?** *J. soc. Issues*, 1962, 18(2), 120-134.—"Societal forces, taken in the round, are distal causal factors in group relations. From them one can predict, at least roughly, the course of integration and segregation, of accommodation and conflict. . . . At the same time, the intervening factor of personality is ever the proximal cause of all human conduct. Conformity is the missing link that explains why and how societal forces eventuate into patterns of acceptance or discrimination—so far as they do so. . . . In so far as societal predictions fail it is because they overlook the non-conformist, deviant, morphogenic aspects of personal behavior—of which there are many."—*A. Barclay.*

6564. Barclay, John E., & Weaver, Herbert B. (U. Hawaii) **Comparative reliabilities and ease of construction of Thurstone and Likert attitude scales.** *J. soc. Psychol.*, 1962, 58(1), 109-120.—Construction of 2 alternate forms of a Thurstone scale of 21 items was found to consume 43.2% more time than construction of 2 alternate forms of a Likert scale of 21 items. The Likert scales, moreover, exhibit a very significantly higher degree of reliability ($r = .97$) than do the Thurstone scales ($r = .66$). The scales developed were for the purpose of measuring the attitudes of tourists in Hawaii toward their visits, and they will be made available to the tourist industry.—*Author abstract.*

6565. Bonato, Roland Richard. (U. Connecticut) The effect of source credibility and amount of information on opinion change. *Dissert. Abstr.*, 1962, 22(8), 2895.—*Abstract*.

6566. Broverman, Inge Komers. (Clark U.) Factors influencing the impressions of others. *Dissert. Abstr.*, 1962, 22(9), 3279-3280.—*Abstract*.

6567. Crane, Lauren Edgar. (Stanford U.) A comparison of the immunization effects of implicit and explicit presentation of counter-arguments. *Dissert. Abstr.*, 1962, 22(10), 3745.—*Abstract*.

6569. Ehrlich, Howard J. (National Inst. Mental Health) Stereotyping and Negro-Jewish stereotypes. *Soc. Forces*, 1962, 41(2), 171-176.—Questionnaire responses from 366 undergraduates in introductory sociology classes reveal "a distinctive, mutually exclusive, and highly consensual pattern of Negro and Jewish stereotypes." There is "evidence for both the generality of stereotyping and the specificity of stereotype assignment." New light on the components of prejudice may emanate from "a strategy of focus upon the determinants of stereotype assignment and the manifest content of stereotypes."—*A. R. Howard*.

6570. Feather, N. T. (U. New England, Australia) Cognitive dissonance, sensitivity, and evaluation. *J. abnorm. soc. Psychol.*, 1963, 66(2), 157-163.—In a test of dissonance theory the sensitivity of regular smokers to information about smoking and lung cancer was compared to nonsmokers. Smokers were more interested in such information than nonsmokers; but they did not seek out negative evidence about lung cancer and smoking, nor did they reject information about the harmful effects more than nonsmokers. No clear-cut results emerge from the analysis of dissonance reduction in relation to extraversion and neuroticism, though regular smokers were higher in extraversion than nonsmokers.—*Journal abstract*.

6571. Finney, J. C. Attitudes of others toward Hawaiians. *Soc. Process*, 1961-62, 25, 78-83.—Depth interviews with 73 members of "other ethnic groups in Hawaii towards Hawaiians" indicate that "many people see Hawaiians in terms of the stereotype of supposedly happy, unspoiled 'primitive' man. On a less conscious level this includes identifying the Hawaiians with one's id impulses and basic biological drives. . . . Nevertheless, the same persons usually say that they themselves could not follow the Hawaiian way of life. They are evidently restrained by conscience, Puritanism, rigidity, reaction formation, need for achievement, ambition, or 'The Protestant ethic.'"—*E. L. Gaier*.

6572. Grand, Sheldon Allen. (U. Buffalo) Reactions to unfavorable evaluation of the self by others in relation to the function of acceptance of disability. *Dissert. Abstr.*, 1962, 22(7), 2485-2486.—*Abstract*.

6573. Joshi, Vidya. (U. Lucknow, India) Attitude towards reception of technology. *J. soc.*

Psychol., 1962, 58(1), 3-7.—This paper attempts to study the implication of the hypothesis that the adoption of a new or changed mode of technology depends primarily on the receptivity of the culture and its people rather than on the material and technical resources. Qualitative and quantitative data obtained seem to confirm the hypothesis.—*Author abstract*.

6574. Klausner, Samuel Z. (Columbia U.) Images of man: An empirical enquiry. *J. scient. Stud. Relig.*, 1961, 1, 61-73.—Data are derived from a content-analysis of 591 books and articles written by ministers relating psychology to pastoral duties and by psychiatrists analysing the role of values, especially religious values, to psychotherapy. There are indications that the religio-psychiatric movement among the clergy involves gradual acceptance of the scientific image of man. Religion as a whole is not becoming scientific; rather, pastoral counselors bearing this image are emerging as ministerial specialists.—*O. Strunk, Jr.*

6575. Kosa, John, & Schommer, Cyril O. (U. North Carolina) Religious participation, religious knowledge, and scholastic aptitude: An empirical study. *J. scient. Stud. Relig.*, 1961, 1, 88-97.—362 native-born white male students under 26 years of age were administered the Le Moyne Religious Test. Comparing these scores with various achievement and aptitude scores produced the following conclusions: (a) religious knowledge and participation in religious activities appear to be correlated with performance on scholastic achievement and aptitude tests, (b) there is no indication that higher scholastic achievements would be associated with less pro-religious attitudes, (c) the religious attitudes of the Ss are affected by social environment, and (d) a church oriented environment directs the interest of the individual toward religion and thus creates conditions which lead to more intensive religious participation as well as greater religious knowledge.—*O. Strunk, Jr.*

6576. Levinson, Boris M. (Yeshiva U.) Yeshiva College subcultural scale: An experimental attempt at devising a scale of the internalization of Jewish traditional values. *J. genet. Psychol.*, 1962, 101(2), 375-399.—The Yeshiva College Subcultural Scale (YCSS) is an experimental scale designed to measure the extent to which Jewish traditional values have become internalized among Yeshiva College freshmen. The aim was to find a scale which might be operative within the narrow confines of Jewish traditional culture. It is based on the hypothesis that the response set on an item in a structured personality test for a group depends to a great extent upon the subcultural forces which shaped the personality dynamics of the respondents. YCSS consists of 99 MMPI items on which 2 Yeshiva College freshmen classes responded significantly differently from that of the general population. YCSS was cross-validated with another Yeshiva College freshmen class and a non-Jewish graduate student group.—*Author abstract*.

6577. McDill, Edward L., & Ridley, Jeanne Clare. (Vanderbilt U.) Status, anomia, political alienation, and political participation. *Amer. J. Sociol.*, 1962, 68(2), 205-213.—Low social status, anomia, and political alienation of a sample of suburban residents are shown to be significantly related

to a negative vote and unfavorable attitude on the issue of metropolitan government in Nashville, Tennessee. Anomia and political alienation interpret, to a very limited extent, the association between social status and political participation in the Nashville issue. It is concluded that the 3 independent variables are, for the most part, additive in their effects on the extent and direction of participation in a local political issue.—R. M. Frumkin.

6578. Marrow, Alfred J. **Changing patterns of prejudice: A new look at today's racial, religious and cultural tensions.** Philadelphia, Pa.: Chilton, 1962. xiv, 271 p. \$6.95.—Prejudice, the nature and extent, is examined as a problem of the individual and as an issue in intergroup relations. Illustrations are primarily from the problems, methods, and approaches of New York City's Commission in Intergroup Relations and include discussions on specific incidents in restaurants, the press, gangs, social clubs, housing, and education. Prejudice involving Negro and Puerto Rican is explored.—C. W. Page.

6579. Nemeth, Alexander J. (U. Connecticut) **Some determinants of the individual's global disposition of favorableness or unfavorableness toward the other person: An experimental study in impression formation.** *Dissert. Abstr.*, 1962, 22(8), 2877.—Abstract.

6580. Nidorf, Louis Joseph. (Clark U.) **Individual differences in impression formation.** *Dissert. Abstr.*, 1962, 22(9), 3261-3262.—Abstract.

6581. Parida, G. (Cuttack, India) **Popular beliefs and practices.** *Indian J. Psychol.*, 1961, 36(4), 161-168.—An inventory of 100 common beliefs and practices was administered to 200 college students from the Cuttack region of Orissa State. The writer distinguishes between misbeliefs founded on misinformation versus misbeliefs based on superstitious fears. In general, no significant differences in numbers of beliefs or practices admitted by college students were found between subsamples dichotomized according to college course (science or arts), residence (town or village), occupation of parent (farming or service), and further classified according to successive year in college. Subsample n's are not given. For the total group of students, numbers of superstitions practiced were less than number believed. The writer concludes that college education in an Indian university does not kill superstitions or popular misbeliefs and their practice by students.—J. T. Cowles.

6582. Pavey, Stanley. (Ohio State U.) **The effect of failure on future time perspective in open and closed belief systems.** *Dissert. Abstr.*, 1962, 22(10), 3741-3742.—Abstract.

6583. Photiadis, John D. (U. Minnesota) **Education and personality variables related to prejudice.** *J. soc. Psychol.*, 1962, 58(2), 269-275.—Psychological theories suggest that prejudice is satisfying some psychic need of the individual. Empirical evidence has indicated that a number of variables are responsible for this need. The purpose of this investigation was, 1st to examine the relationship between formal education and these variables, and 2nd, to examine the relationship between each of these variables and education when the remaining variables are controlled. Zero order correlation analysis

showed that all these variables—Orthodoxy, Extrinsic Belief, Anomia, Status Concern, Conservatism, Authoritarianism, Withdrawal Tendencies, and Anti-social Tendencies—are related to education negatively. When partial correlation analysis was used, however, only Orthodoxy, Status Concern, and Withdrawal Tendencies were found to be significantly related to education. All 3 relationships were negative.—Author abstract.

6584. Photiadis, John D., & Bigger, Jeanne. (South Dakota State Coll.) **Religiosity, education, and ethnic distance.** *Amer. J. Sociol.*, 1962, 67(6), 666-672.—The findings of on a sample of 300 adult men and women in a small community in eastern South Dakota: orthodoxy, extrinsic belief, anomia, status concern, conservatism, withdrawal tendencies, and anti-social tendencies are not related to ethnic distance. Church participation and formal education are negatively related. Authoritarianism is the only personality variable related positively to ethnic distance.—R. M. Frumkin.

6585. Rao, N. C. S. **Measurement of social attitude.** *J. voc. educ. Guid., Baroda*, 1961, 7(4), 171-185.—A description of the development of a Likert-type attitude scale for the measurement of conservatism-radicalism and tender-toughmindedness using a sample of 360 college students from 4 widely spaced areas in India. All students were graduate students in education, psychology, commerce, or science; modal age was 23; the sample was predominantly male. Item analysis resulted in a final scale of 48 items with odd-even reliability coefficients of .90 and .79, respectively. Validation was attempted against student self-ratings only on the conservative-radical dimension, using a group of 100 "new" students. The resulting r was .51.—W. L. Barnette, Jr.

6586. Ring, Kenneth, & Kelley, Harold H. (U. Connecticut) **A comparison of augmentation and reduction as modes of influence.** *J. abnorm. soc. Psychol.*, 1963, 66(2), 95-102.—A 2×2 factorial experiment was conducted which attempted to influence the opinion responses of Ss (introductory psychology students) through the use of 1 of 2 methods, augmentation or reduction. Also varied was the plausibility of the standard employed by the influencer to assess the "correctness" of the Ss' opinions. It was found that reduction (giving mild praise for correct answers, but extreme criticism for wrong ones) when coupled with an implausible standard produced the greatest concealment of opinions, the least learning of the influencer's standard, and the least acceptance of it. With the plausible standard, reduction was not noticeably different in its effects from augmentation (giving high praise for correct answers and mild reproof for wrong ones).—Journal abstract.

6587. Rosenberg, Milton J., & Oltman, Philip K. (Ohio State U.) **Consistency between attitudinal affect and spontaneous cognitions.** *J. Psychol.*, 1962, 54(2), 485-490.—A new method for eliciting and quantifying the cognitive aspect of social attitudes was described. Data were reported concerning the relationship between an index of attitudinal cognition based upon this procedure and a separate index of attitudinal affect. These data seem relevant to the field of attitude study in 2 ways: they provide useful additional confirmation of the proposition that

the affective and cognitive components of attitudes are typically organized in close consistency with one another; they help validate a new method of attitude measurement that may have wide utility both in experimental studies and in sample surveys of social attitudes.—*Author abstract.*

6588. Rosengren, William R. (Brown U.) Social instability and attitudes toward pregnancy as a social role. *Soc. Probl.*, 1962, 9(4), 371-378.—The function of the sick role in cases of abnormal organic damage seems to be chiefly societal in nature—to provide a legitimate role for persons who are defined as unable to enact their more normal social roles. In the case of pregnancy, however, the function of the role of the sick seems to be more ideosyncratic in nature insofar as it offers an opportunity to enact a sanctioned role for those who may be unwilling to continue their usual social roles, or who for some reason find the sick role more satisfying than the roles which they are ordinarily called upon to perform. There was found among the 110 pregnant women studied a negative association between self-esteem and sick role expectations. Those women with value conflicts tended to regard themselves as more sick than those without such conflicts. The findings are consistent with the hypothesis that social instability is an important source of motivations to enact the sick role.—*R. M. Frumkin.*

6589. Schubert, Glendon. (Michigan State U.) A solution to the indeterminate factorial resolution of Thurstone and Degan's study of the Supreme Court. *Behav. Sci.*, 1962, 7(4), 448-458.—"The purpose of this paper has been to suggest a theory of the voting behavior of Supreme Court justices, and to describe a method which can be used to provide a test of the theory. It is believed that the application of the theory and method to sets of factor data provided by Thurstone and Degan and attitudinal data provided by Pritchett has made possible a plausible solution to the problem of factorial interpretation that was left unresolved by the earlier study of Thurstone and Degan. It is also possible that the proposed combination of factor analysis and cumulative scaling, within a multidimensional composition model suggested by Coombs' theory of data, may prove to be of general interest."—*J. Arbit.*

6590. Secord, P. F., Backman, C. W., & Meredith, Helen E. (U. Nevada) Cue-dominance in person perception as a function of strength of perceiver-need. *J. soc. Psychol.*, 1962, 58(2), 305-313.—The following hypothesis was investigated: trait cues in the stimulus person that correspond to dominant traits of the perceiver have more effect on the inference process than do trait cues corresponding to traits not characteristic of the perceiver. Personality sketches representing the highest and lowest scoring needs obtained by 132 Ss on the Edwards Personal Preference Schedule (EPPS) were judged on a trait checklist. Ss also ranked the 14 stimulus person descriptions according to the degree to which they liked or disliked these kinds of persons. An analysis of the results indicated that when liking for the stimulus person was controlled, no appreciable difference was found between inferences made about the stimulus person representing one's high EPPS need and the person representing one's low EPPS need.—*Author abstract.*

6591. Sherif, Muzafer, & Hovland, Carl I. (U. Oklahoma) Social judgment: Assimilation and contrast effects in communication and attitude change. New Haven, Conn.: Yale Univer. Press, 1961. xii, 218 p. \$6.00.—Assimilation and contrast effects in the placement of opinion items in a series and in the evaluation of the acceptability of such items are explained by principles derived from psychophysical studies of stimulus placement and the development of scales of judgment. The book contains a systematic survey of relevant psychophysical studies plus an analysis of several of the authors' recent experiments on the judgment of weights, opinion topics, and political parties. In addition to the argument that assimilation and contrast effects depend on the location of anchors employed by the judge in evaluating the stimulus items, the authors introduce the concepts of latitude of acceptance and latitude of rejection and discuss the implications of these concepts for attitude change and communication.—*K. E. Davis.*

6592. Siegman, Aron Wolfe. (Bar-Ilan U., Israel) An empirical investigation of the psychoanalytic theory of religious behavior. *J. scient. Stud. Relig.*, 1961, 1, 74-78.—Using undergraduate and 1st-year medical students as Ss, the following hypotheses were tested: (a) the more religious in belief and observance have a greater tendency to project, (b) there is a positive correlation between Ss' feelings and concepts concerning God and their feelings and concepts concerning their father, and (c) males have a greater tendency than females to perceive God as a punishing figure. Hypotheses a and c were not confirmed. There was some support for hypothesis b.—*O. Strunk, Jr.*

6604. Feldman, Marvin J., & Goldfried, Marvin R. (U. Buffalo) *Validity of group judgment as a factor affecting independent and conformity behavior.* *J. soc. Psychol.*, 1962, 58(2), 289-294.—The 72 female Ss were seated in booths in groups of 4. Their task was to match 1 of 3 lines with a standard. Unknown to them, each S responded in 3rd position while E controlled responses in other

positions. Of 21 slides, 12 contained 1 correct answer (A slide); the other 9 slides contained 2 or more correct alternatives (B slides). In Group I, a unanimously wrong answer was given for positions controlled by E on A slides. In Group II, the majority apparently responded correctly on A slides. In both groups on the B slides the majority unanimously chose 1 of the correct alternatives. From responses to A slides, Group I Ss were divided into High, Middle, and Low degrees of independence. On B slides, Highs tended to select alternatively correct responses while Low tended to agree with the majority response. In Group II, where majority responses to A slides were valid, Ss still chose 40% of the alternatively correct choices on B slides. The results suggest that it makes a difference whether or not the majority response is valid or invalid.—*Author abstract.*

6605. Frye, Ronald Lee. (Louisiana State U.) *The effect of feedback of success and effectiveness on self, task, and interaction oriented group members.* *Dissert. Abstr.*, 1962, 22(9), 3272-3273.—*Abstract.*

6606. George, Clay E. *Some determinants of small-group effectiveness.* *HumRRO res. Memo.*, 1962, Subtask Unifect, No. 26. v, 118 p.—Literature between 1955 and 1962 is surveyed to abstract variables of problem-solving group effectiveness with emphasis on young, adult males. A single set of terms was sought. Characteristics of efficient groups were isolated, as well as methods for developing and preserving them. "Formal leadership, ability, and respect" should occur in the same individual. A "task-oriented code" is significant. Detailed findings are outlined. Research is proposed. (157 ref.)—*R. Tyson.*

6607. Goffman, Erving. (U. California) *Encounters: Two studies in the sociology of interaction.* Indianapolis, Ind.: Bobbs-Merrill, 1961. 152 p. \$1.95.—The 2 papers in this volume are concerned with focused interaction, i.e., an encounter. For the participants, this involves: a single visual and cognitive focus of attention, a mutual and preferential openness to verbal communication, a heightened mutual relevance of acts, an eye-to-eye ecological huddle that maximizes each participants opportunity to perceive the other participant's monitoring of him. Whether bracketed by ritual or not, encounters provide the communication base for a circular flow of feeling among the participants as well as corrective compensations for deviant acts. The two essays, "Fun in Games," and "Role Distance," deal with this single unit of focused gathering.—*N. De Palma.*

6608. Hicks, Jack M. (Northwestern U.) *The influence of group flattery upon self evaluation.* *J. soc. Psychol.*, 1962, 58(1), 147-151.—12 personally acquainted small groups of undergraduate college students were used in determining the effects of group flattery upon self-evaluation and its persistence over time. Each S was asked to evaluate himself and each other member of his group on 10 trait characteristics. 2 days later, a report of systematically inflated self-ratings (flattery) was presented to each S as a bonafide consensus of group opinion. Ss reevaluated themselves immediately after, and 5 days after exposure to flattery. Results indicated (a) a significantly greater increase of flattered to unflattered traits

immediately after flattery, (b) no decrement in self-revaluations after 5 days and (c) no significant difference between flattered and unflattered traits after 5 days.—*Author abstract.*

265-276.—College students predicted missing attitude relationships among members of 16 4-man hypothetical research staffs, considering themselves as one of the members. The hypothetical groups were varied in plausibility and differentiability. Ss produced more maximally balanced completions in highly plausible and/or differentiable structures, and with lower tension and greater confidence in making completions. (16 ref.)—*W. W. Meissner.*

6617. Smith, Claggett Gordon. (U. Michigan) **Autism, realism, and system balance in a student group.** *Dissert. Abstr.*, 1962, 22(7), 2489.—*Abstract.*

6618. Steiner, Ivan D., & Rogers, Evan D. (U. Illinois) **Alternative responses to dissonance.** *J. abnorm. soc. Psychol.*, 1963, 66(2), 128-136.—50 male and 50 female Ss were placed in an experimental situation in which they found their judgments contradicted by a respected associate of the same sex. Ss were free to resolve the dissonance by conforming to the contrary judgments of the associate, rejecting the associate as one who was less competent than he had been thought to be, underrecalling the disagreements, or, devaluating the importance of the topics about which disagreements had occurred. Female Ss made less use of rejection than did male Ss and were more inclined to tolerate the conflict. Other findings suggest that individuals are inclined to employ the 4 responses as alternative means of reducing dissonance rather than as supplementary means. Finally, correlations relating the MA scale to conformity, underrecall, and tolerance were significantly different for the 2 sexes, suggesting that the effect of anxiety upon Ss' choice of dissonance reducing response depends upon the sex of the Ss.—*Journal abstract.*

6619. Strickland, Bonnie R., & Crowne, Douglas P. (Ohio State U.) **Conformity under conditions of simulated group pressure as a function of the need for social approval.** *J. soc. Psychol.*, 1962, 58(1), 171-181.—This study was an attempt to test the hypothesis that individuals with a high need for social approval will distort their judgments of objectively determinable stimuli in response to perceived group pressure more frequently than persons less concerned with social approval. A group atmosphere was simulated by means of a tape recording. Ss were presented with the conflicting demands of an unambiguous auditory stimulus and the unanimous reports of 3 preinstructed and prerecorded accomplices who gave inaccurate estimates. Conformity was the number of times the naive S gave the same incorrect response as the accomplices. Personality measures were the M-C Social Desirability scale (an index of need for social approval) and the Barron Independence of Judgment scale (a measure of conformity). Results indicated that Ss with a high need for social approval conform significantly more often than those Ss with a weaker approval need. Further, the Barron scale was found to be significantly related to behavior in the simulated conformity situation, lending support to this means of simulating group pressure.—*Author abstract.*

6620. Turk, Herman; Hartley, Eugene L., & Shaw, David M. (Duke U.) **The expectation of social influence.** *J. soc. Psychol.*, 1962, 58(1), 23-29.—Cooley's discussion of the 3-way relationship between primary group, human nature, and uni-

formity of social process suggested a heretofore neglected question in research on social influence. Such research has shown that the flow of influence is positively associated with common group membership and with cohesive social relations. However, it does not specify whether such association between relationship and process is expected by the influential and influenced parties or whether it is an outgrowth of the interactive situation. In the present study, naive respondents rated photographs as to the cohesion and degree of common membership expected with each pictured person and as to the amount of influence expected to flow between respondent and such persons. The findings strongly support the specification that the relational correlates of influence are expected, but they do not necessarily reject the alternative explanation for the existence of such correlates.—*Author abstract.*

6621. Vaughan, G. M., & Mangan, G. L. (Victoria U., Wellington, New Zealand) **Conformity to group pressure in relation to the value of the task material.** *J. abnorm. soc. Psychol.*, 1963, 66(2), 179-183.—This study was an investigation of the effect of varying the value content of a perceptual task under conditions of group pressure, when factual anchorage was held constant. 20 Ss, each with both high and low scores on the Allport-Vernon Study of Values, were exposed to a group pressure situation in which task materials were of both high and low values for each S. The results showed that group pressure is resisted when highly valued material (particularly economic) is utilized, and that, in general, susceptibility to influence increases with pressure.—*Journal abstract.*

6622. Watson, Jeanne, & Potter, Robert J. (U. Chicago) **An analytic unit for the study of interaction.** *Hum. Relat.*, 1962, 15(3), 245-263.—An attempt is made to provide a unit for social interaction. The assumptions are made that sociability is a form of interaction in which identification has primary importance, and that the major products of social interaction are feelings and esteem for self and others and beliefs about self, others, and the external world. The "episode" is defined as the unit in terms of a unitary role system, in which the behaving unit is an "axis" composed of 2 or more individuals. The classification of relationships takes the distinction between "presenting" and "sharing" as its point of departure. A conversational episode is used for illustration.—*W. W. Meissner.*

LEADERSHIP

6626. Stogdill, Ralph M., Goode, Omar S., & Day, David R. (Ohio State U.) **New leader behavior description subscales.** *J. Psychol.*, 1962, 54(2), 259-269.—Descriptions of the leader behavior of ministers (N = 103) and community leaders (N = 57) were scored on 10 subscales. Factor analysis of the subscale intercorrelations showed 4 of the subscales (Persuasiveness, Initiating Structure, Role Enactment, and Production Emphasis) with high loadings on the general factor in both populations. 3 of the subscales (Representation, Predictive Accuracy, and Initiating Structure) appeared with at least moderately high loadings on specific factors in both populations.—*Author abstract.*

6627. Trentini, G. **La similarità assunta dei leaders.** [Assumed similarity of leaders.] *Arch. Psicol. Neurol. Psichiat.*, 1962, 23(6), 537-565.—Fiedler's notion of assumed similarity as the difference between self-evaluation and assumption of self-evaluation by another individual is a fertile one. The concept of differential similarity is used to specify the distance between a leader and his group.—*L. L'Abate.*

LANGUAGE & COMMUNICATION

6628. Burke, Kenneth. **A grammar of motives. A rhetoric of motives.** Cleveland, O.: World, 1962. 868 p. \$2.95 (paper).—Now presented in a single volume, these 2 works were first published in 1945 and 1950, respectively.—*C. T. Morgan.*

6629. Cohen, Arthur M., & Bennis, Warren G. (Case Inst. of Technology) **Predicting organization in changed communication networks.** *J. Psychol.*, 1962, 54(2), 391-416.—The results confirmed the hypothesis that when wheel networks are changed to completely connected networks, groups will develop central-hub problem-solving systems like those developing in wheel networks. 10 groups of 5 men each solved 60 problems requiring the discovery of a common symbol, in 1 of 2 conditions, (a) a completely connected network throughout, and (b) a wheel-to-completely connected network. Additional support was provided for the thesis that systematic use of alternative problem-solving experience, derived from the past, influences the kinds of problem-solving systems that groups develop, and that such influence is inducible and predictable.—*Author abstract.*

6630. Doehring, D. G. (Indiana U. Medical Cent.) **Value, frequency, and practice in visual word recognition.** *Psychol. Rec.*, 1962, 12, 209-216.—The value of frequent and infrequent words in previous visual threshold studies has not been adequately controlled. It was here hypothesized that the value factor had a transitory and the frequency factor a permanent effect. Over 4 consecutive sessions results showed no value effect, but consistently lower thresholds for the more frequent words (based on the Thorndike-Lorge G count).—*R. J. Seidel.*

6631. Fjeld, Stanton P. (U. Missouri) **The communication of values and sociometric choice.** *Dissert. Abstr.*, 1962, 22(8), 2896.—*Abstract.*

6632. Hanf, Constance. (Pennsylvania U.) **Intensity of vocal response as a function of vocal and verbal stimuli in interpersonal communication.** *Dissert. Abstr.*, 1962, 22(11), 4095-4096.—*Abstract.*

6633. Holmer, Paul. (Yale U.) **Scientific language and the language of religion.** *J. scient. Stud. Relig.*, 1961, 1, 42-60.—The logic of the discourse of science is not the same as the logic of religion. The language of religion, in contrast to the language about it, must be understood in a context that includes different motives, satisfactions, passions, loves, and all else that is the religious context.—O. Strunk, Jr.

6634. Johnson, F. Craig, & Klare, George R. **Feedback: Principles and analogies.** *J. Commun.*, 1962, 12(3), 150-159.—This theoretical discussion of feedback as applied to human communication includes a review of the literature and of the problems involved in applying the concept.—D. E. Meister.

6635. Joshi, Vidya. (Lucknow, India) **Communication: The process in interaction.** *Indian J. Psychol.*, 1962, 37(1), 11-15.—Author seeks to clarify some of the basic problems in the theoretical area of communication, principally the matters of definition and criteria, the role of communication in personality development, and disturbances in the communication process.—J. T. Cowles.

6636. Levy, Phyllis Addie Kempner. (Columbia U.) **The relationship between the ability to express and to perceive vocal communications of feeling.** *Dissert. Abstr.*, 1962, 22(11), 4082-4083.—*Abstract.*

6637. Natazde, R. G. **Studi su prolemi del pensiero e del linguaggio di psicologi della Repubblica Socialista Sovietica Georgiana.** [Studies on problems of thinking and language by psychologists in the Georgian Socialistic Soviet Republic.] *Riv. Psicol. soc.*, 1962, 29(2), 195-204.—The contribution to the psychology of language by the Russian-Georgian school is reviewed.—L. L'Abate.

6638. Schiffman, Harold. (Princeton U.) **A mathematical model of interpersonal communication.** *Dissert. Abstr.*, 1962, 22(7), 2481.—*Abstract.*

6639. Sebold, Hans. **Limitations of communication: Mechanisms of image maintenance in form of selective perception, selective memory and selective distortion.** *J. Commun.*, 1962, 12(3), 142-149.—This study tested the hypothesis that largely only those meanings are perceived and recalled which reinforce prior images. 152 college students completed questionnaires concerning attitudes toward 2 presidential candidates before and after several TV debates. 143 Ss held the same attitudes before and after the debates. The same Ss indicated their agreement or disagreement with a series of statements by the candidates whose authorship was unidentified. Findings suggest that image-maintaining mechanisms function in a way to preserve a favorable image of the candidate or the preferred party and an unfavorable image of the candidate of the opposing party. The effectiveness of mass communication would appear to be subject to serious limitations due to the existence of definite prior images.—D. E. Meister.

6640. Sebeok, Thomas A. (Indiana U.) **Coding in the evolution of signalling behavior.** *Behav. Sci.*, 1962, 7(4), 430-442.—"Speech communication may be studied as an information system, and natural language as the code used in the system. From this point of view it seems useful, on the one hand, to investigate the analog and digital characteristics of hu-

man communication and, on the other, to compare human and animal communication systems as to the manner in which they code information." (118 ref.) —J. Arbib.

Speech & Linguistics

6641. Becker, S. W., Bavelas, A., & Braden, M. (U. Chicago) **An index to measure contingency of English sentences.** *Lang. Speech*, 1961, 4(3), 139-145.—"Several indexes to measure contingency of sentences were constructed by considering nouns, repeated nouns, and total number of words. Contingency was operationally defined as reconstructibility in order to test the several indexes against a criterion. The best form of the index was then selected and retested. The contingency ranking, based on the index, of 10 sections of text correlated 0.84 with reconstructibility ranking. It was concluded that the index is a valid initial approximation to a measure of contingency if contingency is defined as reconstructibility."—A. E. Horowitz.

6642. Bidwell, Charles E. (U. Pittsburgh) **Language, dialect, and nationality in Yugoslavia.** *Hum. Relat.*, 1962, 15(3), 217-225.—Consideration of social and cultural influences on linguistic differences. Frequency of social interaction tends to inhibit linguistic divergence, as is illustrated by the existence of regional dialects and dialects characterizing social, religious, and occupational groups. When divergence is established, it is perceived with other cultural factors as indices of group membership; language thus comes to have a high affective value due to influences of group identification. The interaction of such factors are studied in Yugoslavia's complex situation.—W. W. Meissner.

6643. Black, J. W. (Ohio State U.) **Relationships among fundamental frequency, vocal sound pressure, and rate of speaking.** *Lang. Speech*, 1961, 4(4), 196-199.—"Twenty males who could control their vocal effort to reach specified soft and loud vocal levels, spanning 30 db., practiced and recorded 3 vowels and 3 phrases at 4 levels." . . . Increments in vocal effort were accompanied by increase in fundamental frequency, the latter shifting upward increasingly with successive steps in sound pressure. The vocal changes that occurred from one level of speaking to another were somewhat specific to the material that was spoken. Phrases that were spoken with different amounts of vocal effort, soft to loud, were spoken at the slowest rate when said softly.—A. E. Horowitz.

6644. Chistovich, L. A., & Klaas, YU. A. (Pavlov Inst. Physiology, Acad. Science, Leningrad, USSR) **K analizu skrytogo perioda "proizvol'noi" reaktsii na zvukovoi signal.** [Toward the analysis of the latency of the "voluntary" response to an auditory signal.] *Fiziol. Zh. SSR*, 1962, 48(8), 899-906.—Lists of vowel sounds were recorded on magnetic tape such that individual sounds had a duration of 15, 50, 100, or 200 msec. These were presented to 10 students individually, who were instructed to respond with the same vowel sound. The stimulus and response were recorded on a 2nd magnetic tape. The latency period was found to be constant over all durations of the stimulus sound, although the character of the response was charged with the shorter stimuli. The frequency distribution of latency periods showed

a maximum near 85-100 msec., independent of the character of the sound. Frequent repetition of the stimuli, however, led to extinction of this maximum and the appearance of later, larger maximums. The author discusses the analysis of the latency interval into 2 phases: (a) passive delay and inertial effects and (b) the "activity of delay." A hypothesis is formulated on the chain of events initiated by a stimulus and leading to a response. (22 ref.)—D. G. McDonald.

6645. Drieman, G. H. J. Differences between written and spoken language. *Acta psychol., Amsterdam*, 1962, 20(2), 78-100.—8 psychology students and 8 more highly educated persons responded to a questionnaire on written and spoken language. In speech there is less sifting; but phenomenologically there is little difference between speech and thought. Writing involves absent persons, status and social distance, irrevocability, etc.—hence, induces greater care, concentration, and planning. Writing introduces shorter texts, longer words, more words of many syllables, more attributive qualities, and a more varied vocabulary.—G. Rubin-Rabson.

6646. Feldstein, Stanley, & Jaffe, Joseph. A note about speech disturbances and vocabulary diversity. *J. Commun.*, 1962, 12(3), 166-17.—This is a study of the relationship between 2 noncontent measures of language behavior suggested by previous research to be related to anxiety. Correlations were obtained between the Non-ah Ratios (speech disturbances) and the mean segmental TTRs (vocabulary diversity) for a group of nonpsychiatric patients and a matched group of schizophrenics. Both the mean and variance of the TTR were found to be significantly related to the Non-ah Ratio for the "normal" sample but not for the schizophrenic sample. The findings raise the possibility that the noncontent aspects of emotional expression are patterned differently for normals and schizophrenics.—D. E. Meister.

6647. Goldman-Eisler, F. (University Coll., London, England) Continuity of speech utterance, its determinants and its significance. *Lang. Speech*, 1961, 4(4), 220-231.—"Pause frequency and word length of speech sequences uttered without break (. . . 'phrases') were measured," under 2 conditions and with 3 types of S: (a) psychiatric interviews with their usual participants, (b) discussion of controversial topics by academic personnel and by middle- and working-class adolescent boys. Differences on both measures were found both between situations and Ss.—A. E. Horowitz.

6648. Goldman-Eisler, F. (University Coll., London, England) The distribution of pause durations in speech. *Lang. Speech*, 1961, 4(4), 232-237.—Measures were taken of "the duration of individual pauses and their distribution over extensive tracts of speech uttered in a variety of situations. The determinants isolated include individuals and conditions of speech utterance (social, emotional, cognitive). The analysis of pause time into duration of individual pauses and pause frequency was shown to be more powerful in gauging the type of decision involved in the production of speech than either of these parameters alone."—A. E. Horowitz.

6649. Goldman-Eisler, F. (University Coll., London, England) The significance of changes in the

rate of articulation. *Lang. Speech*, 1961, 4(3), 171-174.—"The term 'rate of articulation' is applied to the absolute rate of speech, i.e. the rate based on the time of vocal speech utterance exclusive of pauses. The significance of its changes was studied in relation to changes in levels of verbal planning and in degrees of spontaneity. The effect of individual differences was also investigated. While articulation rate proved to be a personality constant of remarkable invariance it also reflects the degree of spontaneity in the production of speech. Variations in level of verbal planning were shown to have no effect on the rate of articulation."—A. E. Horowitz.

6650. Herrmann, Theo. (U. Mainz, Saarstr. 21, Germany) Syntaktische Untersuchungen zum unmittelbaren Behalten von Wortketten. [Syntactic studies on short-term retention of word-chains.] *Z. exp. angew. Psychol.*, 1962, 9(3), 397-416.—The retention of 12- and 24-word chains was tested using Miller and Selfridge's technique. 2 coding and correspondent reproduction modes could be distinguished: (a) schematic and confabulatory, (b) reconstructive and pedantic. Syntactic characteristics of the material, instructions, and motivational components determined which of the 2 modes was chosen by the Ss.—W. J. Koppitz.

6651. Humecky, A., & Koutsoudas, A. (U. Michigan) Some further results on the resolution of syntactic function by linear context. *Lang. Speech*, 1961, 4(3), 146-149.—"A modified procedure for identifying the Russian -o/-e/-ee adverbial modifier or predicative complement and providing its correct English equivalent by mechanical translation."—A. E. Horowitz.

6652. Kirillov, N. E., & Fatkin, L. V. (Moscow, USSR) Eksperimenty po opoznavaniyu avtomatami zvukov rechi. [Experiments on the recognition of speech sounds by machines.] *Vop. Psichol.*, 1962, No. 3, 45-56.—This paper deals with the automatic identification of phonemes by their spectral and temporal features. It is shown that spectral characteristics available today fail to afford a sufficiently reliable and practically useful criterion of identification and for this reason can be used only to a limited extent. The temporal features studied which involve distribution of the lengths of intervals between the zero points of the speech clipped to a minimum have enabled a reliable classification of phonemes into groups; the division of groups into component subgroups can be carried on until individual phonemes are isolated.—H. Pick.

6653. Liberman, A., Harris, K., Eimas, P., Lisker, L., & Bastian, J. (Haskins Lab., N. Y.) An effect of learning on speech perception: The discrimination of durations of silence with and without phonemic significance. *Lang. Speech*, 1961, 4(4), 175-195.—Discrimination of various durations of silence "was measured when, as part of a synthetic speech pattern, that variable cued a phonemic distinction and when the same variable appeared in a non-speech context. . . . With acoustic differences equal, discrimination proved to be more acute across the . . . phoneme boundary than within either phoneme category. . . . In the case of the non-speech sounds the durations of silence separated two bursts of noise tailored to match the . . . characteristics of the speech signals. There was, with these stimuli, no appreciable

increase in discrimination in the region corresponding to the location of the phoneme boundary."—A. E. Horowitz.

6654. Mandler, George, & Mandler, Jean M. (U. Toronto, Canada) Associative behaviour and somatic response. *Canad. J. Psychol.*, 1962, 16(4), 331-343.—A nonsense syllable, adjective, magazine photograph, or Rorschach blot was projected on a screen for 30 sec. and S instructed to respond with "all the words that the stimulus brings to mind," while GSR and heart rate were monitored. Ss with a high rate of associative frequency tended to give more idiosyncratic responses and to have shorter response times. "Individual differences in verbal behaviour are not related to differences in physiological response."—R. S. Davidson.

6655. Miller, George A. (Harvard U.) Some psychological studies of grammar. *Amer. Psychologist*, 1962, 17(10), 748-762.—Language is "an extremely complicated human skill." What it consists of and how it functions requires detailed examination. Some satisfactory way of dealing with grammar and its combinatorial processes is required to describe language as a skill. Concepts of modern linguistics are used. Psychological aspects of syntactic structure are considered and specified as important variables to explore. Linguistic theory and empirical studies are cited. "I believe that one of the best ways to study a human mind is by studying the verbal systems that it uses." Such a program is not only important, but immediately possible.—S. J. Lachman.

6656. Peterson, G. E. (U. Michigan) Automatic speech recognition procedures. *Lang. Speech*, 1961, 4(4), 200-219.—Discussion of "the transformation of the varying acoustical parameters of speech to a discrete code to form the printed output of an automatic speech recognizer. The development of general automatic speech recognition procedures requires a definition of the linguistic code to be transcribed, and a statement of the dialectal and other conditions under which the recognition is to be achieved. Essential procedures . . . include: the analysis of the input speech wave into a series of basic acoustical parameters in frequency; the representation of the normalized parameters by a set of phoneme and prosodeme candidates by reference to stored linguistic information; and the print-out into words separated by spaces and grouped by means of a set of punctuation marks."—A. E. Horowitz.

6657. Riegel, K. F., & Riegel, R. M. (U. Michigan) Prediction of word-recognition thresholds on the basis of stimulus-parameters. *Lang. Speech*, 1961, 4(3), 157-170.—"Fifty words were tachistoscopically administered to 24 Ss with an average age of 16.4 years. Of the 40 parameters analyzed, the following were the best predictors of the thresholds and were included in a multiple regression equation:" (a) classification of words into concrete nouns vs. all others, (b) classification of words with vs. without prefixes, (c) logarithms of word-frequencies, (d) number of letters. "The multiple correlation (0.74) and the correlation with the logarithms of word-frequencies (-0.50) are surprisingly low. . . . it was concluded that recognition of words is to a greater degree dependent on the frequency with which Ss had prior experiences with objects (or perceptual images) rather than on the frequency with which Ss had

perceived or used the names attached to them."—A. E. Horowitz.

6658. Smirnov, K. M., Asafov, B. D., & Osipova, O. V. (State U. Leningrad, USSR) Ob elektricheskoi aktivnosti rechevoi muskulatury pri dykhatel'nykh i dvigatel'nykh reaktsiyakh. [The electrical activity of speech muscles during respiratory and motor responses to orders.] *Fiziol. Zh. SSSR*, 1962, 48(11), 1325-1331.—EMG activity of mouth, speech, and shoulder muscles was recorded in various combinations in 7 human Ss ranging from 6 to 47 years of age. A response was observed in the EMG of speech muscles during preliminary instructions and during the execution of respiratory and motor responses. This response was more stable and persistent than the orientational reflex, as measured by the GSR, although with repeated stimulation the response was observed to extinguish. Interpretations of the response are discussed.—D. G. McDonald.

6659. Somers, H. H. (U. Louvain) The measurement of grammatical constraints. *Lang. Speech*, 1961, 4(3), 150-156.—"By means of the coefficient of constraint (D) it is possible to measure the constraint exercised by one grammatical type on another, calculating the redundancy of the nth grammatical type when only the first of the chain is known." The results of the computations are presented, calculated on 3 Greek texts of the New Testament. The conclusion is reached that the constraint is greatest for the 2nd type in the chain, the relative constraint being practically the same for the 3 texts.—A. E. Horowitz.

6660. Taylor, Insup Kim, & Taylor, Maurice M. (Johns Hopkins U.) Phonetic symbolism in four unrelated languages. *Canad. J. Psychol.*, 1962, 16(4), 344-356.—To test whether or not there is an intrinsic correspondence between sounds and meanings, consonant-vowel-consonant nonsense syllables were created by monolingual students from the United States, Japan, Korea, and South India, on the following dimensions: big-small, active-passive, warm-cold, and pleasant-unpleasant. Phonetic symbolism occurred under all conditions tested, but the meanings associated with any particular sound were different from language to language.—R. S. Davidson.

Mass Communication

6661. Bailyn, Lotte; Williams, Raymond; Himmelweit, Hilde T., Seldes, Gilbert; Bogart, Leo; Maz, Veronica; Pool, Ithiel de Sola, & Adler, Barbara. The uses of television. *J. soc. Issues*, 1962, 18(2), 1-61.—". . . the articles that follow cover many topics. Leo Bogart describes some of the characteristics of American commercial television and reviews the knowledge . . . about television's audience and the role it plays in the American home. A more speculative analysis . . . is given by Gilbert Seldes. . . . Raymond Williams discusses the development and present state of British television in relation to . . . British society; Hilde Himmelweit summarizes the principles . . . derived from British research on the effects of television. Finally, two articles deal with educational television in America."—A. Barclay.

ESTHETICS

6662. Frumkin, Robert Martin. (Ohio State U.) Preferences for traditional and modern painting:

An empirical study. *Dissert. Abstr.*, 1962, 22(11), 4106-4107.—*Abstract*.

6663. Lepore, Giuseppe. *Ulteriori ricerche sul Test del Graves*. [Further research on the Graves Judgment Art Test.] *Boll. Psicol. appl.*, 1962, No. 51-52, 15-18.—An Italian scoring key of the Graves Judgment Art Test was constructed, and the correlation between test scores and school grades and between test scores and art interests of 3 groups of students were calculated. Italian art students used as Ss for the adaptation of the test did not differ from the artists used as Ss for the American key. The test proved capable of foreseeing scholastic success in art schools.—*L. V. Steinzor*.

6664. Lundin, R. W., & Allen J. D. (Hamilton Coll.) A technique for training perfect pitch. *Psychol. Rec.*, 1962, 12, 139-146.—Criterion for perfect pitch was correct identification of objectively presented tones. The Ss responded to presentations of taped piano tones "by lighting a corresponding note on an enlarged metal musical staff by means of a button on a control panel in front of him." 3 of the 5 Ss were run for 36 training sessions (24 tonal presentations per session). 1 S, a singer and trained musician, reached the criterion on a post-training test. All Ss showed a significant gain in pitch discrimination during training and improvement from pretest to posttest.—*R. J. Seidel*.

6665. Pelles, Geraldine. The image of the artist. *J. Aesthet. art Crit.*, 1962, 21(2), 119-138.—A description of the changing self and public images and the class status of the artists particularly of the 17th, 18th, and 19th centuries.—*P. R. Farnsworth*.

6666. Reimer, Bennett. (U. Illinois) Leonard Meyer's theory of value and greatness in music. *J. Res. music Educ.*, 1962, 10(2), 87-99.—A discussion of Meyer's *Emotion and Meaning in Music* (1956) and "Some Remarks on Value and Greatness in Music" (see 34: 7437) and their implications in "the formulation of a philosophy of music education broad enough to take into account music's potential as an agent of self-realization."—*D. S. Higbee*.

6667. Schneider, Daniel E. *The psychoanalyst and the artist*. New York: New American Library, 1962. xii, 236 p. \$.75 (paper).—A paperback edition of a book originally published in 1950.

6668. Wellek, Albert. (U. Mainz) The relationship between music and poetry. *J. Aesthet. art Crit.*, 1962, 21(2), 149-156.—After differentiating between tone painting and program music, this German psychologist offers his views on the conditions under which titles, mottoes, and programs are appropriate to music. The article ends with a consideration of what can be set to music.—*P. R. Farnsworth*.

6669. Yingling, Robert W. Classification of reaction patterns in listening to music. *J. Res. music Educ.*, 1962, 10(2), 105-120.—Results suggest that exposure to a college-level course in music appreciation tends to encourage intellectual analysis over more emotional response.—*D. S. Higbee*.

PERSONALITY & ABILITIES

6670. American Academy of Pediatrics Committee on the Handicapped Child. (Evanston, Ill.) *The application of psychological and psychometric*

testing data to pediatric practice. Evanston, Ill.: AAP, 1962. 21 p.—A general introduction to psychological tests for pediatricians: intelligence tests, social maturity tests, educational achievement and aptitude tests, projective tests, and tests for handicapped children. (Glossary, 38 ref.)—*J. T. Cowles*.

6671. Bannister, D. *Personal construct theory: A summary and experimental paradigm*. *Acta psychol.*, Amsterdam, 1962, 20(2), 104-120.—Kelley's Personal Construct theory with its fundamental postulate and 11 elaborate corollaries is reviewed, as well as the Repertory Grid Test, technique for defining construing. 20 adults responded to 20 photographs in testing 3 hypotheses: constructs within a single subsystem will be structurally related; within one culture each individual tends to have construct relationship patterns which are similar to those of other individuals; it is possible to have significant relationships between constructs for individual Ss and similarity of patterning of construct relationships between Ss without any consensus of agreement about the nature of the elements construed. The results indicated that it is theoretically and experimentally meaningful to talk of construct systems as independent of the particular elements construed.—*G. Rubin-Rabson*.

6672. Dollard, John; Doob, Leonard W., Miller, Neal E., Mowrer, O. H., & Sears, Robert R. *Frustration and aggression*. New Haven, Conn.: Yale Univ. Press, 1961. 209 p. \$1.25 (paper).—A reprint of the book originally published in 1939.

6673. Dudley, Geoffrey A. *Your personality and how to use it*. New York: Emerson, 1962. 160 p. \$2.95.—"The book is written in simple terms for the ordinary man or woman seeking to learn more about his personality."—*C. T. Morgan*.

6674. Kolaříková, L. (Brno, Czechoslovakia) *Projekt osobnosti v psychologii*. [The conception of personality in psychology.] *Ceskoslov Psychol.*, 1962, 6(2), 131-142.—Personality traits are important factors in the adjustment of the individual to self and society. Qualities of personality are only relatively constant and can be differentiated at 3 levels: general, particular, and individual. Genetic research is inevitable. (English & Russian summaries, 31 ref.)—*V. Bricháček*.

6675. Lindner, Robert. *Prescription for rebellion*. New York: Grove (Evergreen), 1962. 305 p. \$1.95 (paper).—A paperback edition of a book originally published in 1952.

6676. Pastuszka, Józef. *Charakter człowieka*. [Human character.] Lublin, Poland: Towarzystwo Naukowe Katolickiego Uniwersytetu Lubelskiego, 1959. 427 p.—The book reviews and summarizes some of the recent developments in character formation. There are 5 major sections dealing with understanding, structure, genesis, typology, and diagnosis of character.—*H. Kaczowski*.

6677. Sarnoff, Irving. (New York U.) *Personality dynamics and development*. New York: Wiley, 1962. xv, 572 p. \$7.75.—The author integrates psychoanalytic theory and empirical research in his development of a theory of personality growth and development in the normal individual. Personality changes are discussed for several developmental levels, e.g., "The child's modes of perception and

thought; The prepubescent child and the impact of adolescence; Personality development in old age." 4 chapters are devoted to a discussion of the functions of the ego and the ego defence mechanisms. The author emphasizes the need for more empirical investigations of personality development.—*S. I. Offenbach*.

6678. Seeman, W., & Marks, P. A. (U. Cincinnati) A study of some "test dimensions" concepts. *J. prof. Tech.*, 1962, 26(4), 469-473.—Rankings of 7 widely used psychological tests by experienced clinicians placed the Rorschach high in stimulus ambiguity, response freedom, and depth. The Strong was ranked lowest in these 3 dimensions. There was a significant correlation between ratings of stimulus ambiguity, response freedom, and depth.—*A. F. Greenwald*.

6679. Sherif, Muzafer. (U. Oklahoma) The self and reference groups: Meeting ground of individual and group approaches. *Ann. N. Y. Acad. Sci.*, 1962, 96(3), 797-813.—Primarily group-centered or primarily individual-centered approaches to an individual's personal relatedness to his environment are both inadequate. The reference group concept integrates sociocultural setting with self conception. It directs attention to subject-object relationships inherent in any motivational system. Objects may be immediately present or conceptual. Reference group relations in particular dimensions and the interrelations among dimensions enable the study of personal consistencies and inconsistencies. (55 ref.)—*B. S. Aaronson*.

6680. Skawran, Paul Robert. Person und Persönlichkeit. [Person and personality.] *Psychol. Rdsch.*, 1963, 14(1), 26-43.—Psychology is foremost the science of the human psyche. A firm dividing line is drawn between psychology and behavioral or physiological disciplines. Person and personality are, in such a psychological system, key concepts. Descent, nature, and destination of man are incorporated in the person-concept while personality is defined as emanation of the person, the degree to which man succeeds in overcoming his subjective image and in fulfilling his destination.—*W. J. Koppitz*.

6681. Toomey, Laura Carolyn. (U. Connecticut) Factors affecting empathic performance. *Dissert. Abstr.*, 1962, 22(8), 2880.—Abstract.

NEW TESTS AND TEST CONSTRUCTION

6682. Kumar, P. Revision of Asthanas' Adjustment Inventory. *J. voc. educ. Guid., Baroda*, 1961, 7(3), 128-134.—This Hindustani Adjustment Inventory, originally designed to screen out poorly adjusted noncollege students, was revised for similar use with a group of 100 adult (engineering) students. An item analysis here revealed 40 highly valid items to constitute the revised inventory. Split-half reliability was .88. Tentative revised percentile norms are provided.—*W. L. Barnette, Jr.*

6683. Mosher, Donald Leo. (Ohio State U.) The development and validation of a sentence completion measure of guilt. *Dissert. Abstr.*, 1962, 22(7), 2468-2469.—Abstract.

6684. Parameswaran, E. G., & Oliver, A. G. (Madras, India) An ascendance-submission inventory for use with adolescents. *Indian J. Psy-*

chol., 1961, 36(4), 149-154.—The development of an adaptation of the Allport A-S Reaction Study for use with Tamil-speaking adolescents in India is described. A single form of 46 items was translated and adapted from the Allport inventory, omitting questions inappropriate for this Indian culture, adding substitutes, and using uniformly 3 alternative choices to each question. It was keyed on criterion subgroups of high school students, and validated against additional teachers' ratings. Satisfactory test-retest and split-half reliabilities appear to have been obtained, as well as correlation with the teachers' ratings of ascendance-submission.—*J. T. Cowles*.

6685. Strickler, Lawrence John. (New York U.) Some item characteristics that evoke acquiescent and social desirability response sets on psychological scales. *Dissert. Abstr.*, 1962, 22(11), 4077-4078.—Abstract.

TEST STANDARDIZATION & EVALUATION

6686. Borgatta, E. F., & Meyer, H. J. The reliability of an objective sentence completion scoring technique. *J. soc. Psychol.*, 1962, 58(1), 163-166.—Reliability data are presented for the Make A Sentence Test (MAST) based on 2 samples of 166 and 168 adolescent girls representing control and experimental Ss in a program of research. After 8 months all but 1 of the 11 scoring categories had statistically significant correlation coefficients in both samples. Compared to the Cattell Junior Personality Quiz (JPQ), the median correlation coefficients were lower .33 and .35 compared to .43 and .49, but the MAST categories tended to be relatively independent while over a quarter of the JPQ categories were significantly related.—*Author abstract*.

6687. Bose, P. K. (Calcutta, India) Construction of norm test indices in test theory. *Indian J. Psychol.*, 1961, 36(4), 173-177.—An index of intertest fluctuation is derived and illustrated with data from West Bengal secondary school examinations in various subjects. The index is based on ratios of selected percentile raw scores of a given test and equivalent scores of a standard test, and continued for successive test administrations.—*J. T. Cowles*.

6688. Germain, José, & Pascual, Marcelo. (Madrid, Spain) Test Mosaico Gille: Normas de aplicación y baremos. [Gille Mosaic Test: Administration procedures and norms.] *Rev. Psicol., gen. apl.*, 1961, 16(Whole No. 60), 845-857.—The authors present a complete Spanish manual for administration of the Gille Mosaic Test. Percentile scales are included for 2 groups of Madrid students.—*E. B. Page*.

6689. Hawkinson, John Russell. (U. Minnesota) A study of the construct validity of Barron's Ego Strength scale with a state mental hospital population. *Dissert. Abstr.*, 4081.—Abstract.

6690. Kulkarni, Sharadchandra Shankar. (Purdue U.) A Marathi revision of the S. R. A. Youth Inventory: A cross cultural study. *Dissert. Abstr.*, 1962, 22(9), 3261.—Abstract.

6691. Kumar, P. A comparison of two adjustment scales. *J. voc. educ. Guid., Baroda*, 1961, 7(4), 163-166.—A comparison of the earlier Hindustani Adjustment Inventory by Asthana, designed for detection of poorly adjusted grade school students in India, with the author's revised Adjustment Inven-

tory developed on a group of engineering students. Both inventories were given to 108 engineering students with a r of .71. Despite this, the revised inventory is considered the more sensitive since it labels (correctly, in the author's opinion) more of the engineering students as well adjusted than does the earlier version of the inventory.—*W. L. Barnette, Jr.*

6692. McDonald, Robert L., & Gynther, Malcolm D. (Medical Coll. South Carolina) **MMPI norms for southern adolescent Negroes.** *J. soc. Psychol.*, 1962, 58(2), 277-282.—MMPIs were obtained from 354 Negroes and 263 white high school seniors from urban segregated schools. Inter-racial comparisons of mean scale scores indicated a need for separate racial norms. In addition, comparison of the Negro intersex mean scale scores indicated a need for separate norms for both Negro males and females.—*Author abstract.*

6693. Schuman, E. P. **A scoring rationale for the Sargent Test of Insight into Human Motives.** *J. proj. Tech.*, 1962, 26(4), 462-468.—Interjudge reliabilities range from .81 to .99 using comprehensive and detailed scoring rules. Test-retest reliability was less satisfactory but higher than that reported by Sargent. It is suggested that further refinement of the modified scoring procedure could contribute to the effectiveness and usefulness of this technique.—*A. F. Greenwald.*

INTELLIGENCE & CREATIVITY

6694. ———. **Frequency curves and the ability of nations: Part II.** *Brit. J. statist. Psychol.*, 1962, 15(1), 80-92.—Although the article is unsigned, apparently it is M. Howard's reply to the points raised by Isaacs [see 37: 6700] in his comments on earlier articles by Burt, Howard, and others.—*N. Earl.*

6695. Burt, Cyril. (University Coll., London, England) **The gifted child.** *Brit. J. statist. Psychol.*, 1961, 14(2), 123-139.—Examined are "certain arguments recently advanced to show that the range of individual differences due to genetic selection is too slight to be of practical importance, and in particular that the abilities of gifted individuals are the result of their early environmental opportunities rather than of their genetic constitution. In reply two new pieces of evidence are brought forward: (i) data demonstrating the wide range of variation to be found among children reared under very similar conditions; (ii) after-histories of persons of high ability whose environment offered an impediment rather than aid to their intellectual development. An estimate is made of the relative frequency of gifted individuals in different socio-economic classes, and suggestions are put forward for improving methods of selection of gifted children of high ability." (19 ref.)—*H. P. Kelley.*

6696. Garwood, Dorothy Semenow. (Claremont Graduate School) **Some personality factors related to creativity in young scientists.** *Dissert. Abstr.*, 22(9), 3273.—*Abstract.*

6697. Gemant, Andrew. (Detroit, Mich.) **The nature of the genius.** Springfield, Ill.: Charles C Thomas, 1961. x, 206 p. \$6.50.—A popular account with anecdotes relating to composers, artists, authors, and scientists.—*A. F. Isaacs.*

6698. Guilford, J. P. (U. Southern California, Los Angeles) **Potentiality for creativity.** *Gifted Child Quart.*, 1962, 6(3), 87-90.—Divergent thinking and transformation abilities contribute directly to the structure of creative thinking. Included among the former are multiple responses appropriate to stimuli, fluency, flexibility, and elaboration abilities; among the latter are redefinition, revision, and freedom from fixedness abilities. Identification of the primary mental abilities inherent in all courses of instruction, moreover, is underway. Algebra and general math courses are cited as examples. Caution is urged in generalizing from a proclivity in one area to another. Also the signs associated with creativity in the arts may be different from those associated with talent in the sciences.—*N. M. Chansky.*

6699. Houston, John P., & Mednick, Sarnoff A. (U. Michigan) **Creativity and the need for novelty.** *J. abnorm. soc. Psychol.*, 1963, 66(2), 137-141.—An experiment designed to demonstrate the reinforcing properties of associative novelty for creative Ss. 60 undergraduates were separated into high (HC) and low (LC) creativity groups on the basis of their scores on the Remote Associates Test. Ss were then presented with a series of pairs of words (each pair containing a noun and a nonnoun) and asked to choose the word they preferred. The choice of a noun was followed by a novel association to that noun. Nonnoun choices were followed by common associations. The HC group significantly increased and the LC group significantly decreased the frequency of their noun choices over the series of pairs. The results support the need for novelty hypothesis.—*Journal abstract.*

6700. Isaacs, J. F. **Frequency curves and the ability of nations: Part I.** *Brit. J. statist. Psychol.*, 1962, 15(1), 76-79.—The author discusses apparent inconsistencies in the assumptions adopted by Burt, Howard, and others in their discussions of frequency distributions resulting from tests of general intelligence as related to eugenics.—*N. Earl.*

6701. Jalota, S. (Panjab U., Chandigarh, India) **A comparative study of intelligence scores by rural and urban school children.** *J. voc. educ. Guid., Baroda*, 1961-62, 8(2-3), 6-7.—A short summary of 4 studies, 3 of which employed a mental ability scale developed at Banaras University, dealing with the typically higher mean scores of urban children compared to rural. 1 of the 4 studies failed to find the expected difference which the author attributes to special features of the particular test format.—*W. L. Barnette, Jr.*

6702. Kidd, Aline H. (Agnews State Hosp.) **The culture-fair aspects of Cattell's Test of g: Culture-Free.** *J. genet. Psychol.*, 1962, 101(2), 343-362.—This was an investigation to determine which items of the test of g were the more culture-fair and which aspects of intelligence were actually measured. The test of g and the culturally-weighted Stanford-Binet, Form L, were administered to 100 children, Anglos and Mexican-Americans, of differing economic status. A positive relationship was found between scores on the 2 tests. Significant differences, arising primarily from differences between the lower class groups, were found between national groups, economic levels, and test used. An item analysis showed that 22 test of g and 3 Binet items were prob-

ably culture-fair in that they did not differentiate between cultural groups or economic levels. A factor analysis of these items produced 4 reference vectors: (a) Ability to overcome Inappropriate Set, (b) Localization, (c) Magnitude, and (d) Progression. A 2nd-order factor analysis produced 2 general reference vectors: (a) Recognition of Total Figure-Ground Relationships and (b) Set. Both 1st- and 2nd-Order reference vectors appeared to operate similarly within all groups used in this study.—*Author abstract.*

6703. Metz, Werner A. (Florida State U.) **The relative effects of stress and praise on creativity.** *Dissert. Abstr.*, 1962, 22(8), 2885-2886.—*Abstract.*

6704. Morin, J. G 52: **Test d'intelligence pour Nord-Africains illettrés.** [G 52: A test of intelligence for North-African illiterates.] *Travail hum.*, 1962, 25(3-4), 353-364.—Several thousand tests, chiefly involving cubes and other patterns, were given Moroccan and Algerian illiterates, and intercorrelations among the various subtests are presented. The author points out the difficulty in estimating validity and reliability because too few could be tested a 2nd time and the nature of the material prevented a split-half technique.—*R. W. Husband.*

6705. Morrison, Robert Floyd. (Purdue U.) **Factored life history antecedents of industrial research performance.** *Dissert. Abstr.*, 1962, 22(7), 2459.—*Abstract.*

6706. Pinneau, Samuel R. **Changes in intelligence quotient: Infancy to maturity.** Boston, Mass.: Houghton Mifflin, 1961. iv, 233 p. \$4.60.—The author directs his coverage to the consistency of the intelligence quotient from early infancy to late adolescence, the development of accurate mental age scores and revised IQ tables for the 1960 revision of the Stanford-Binet scales, the tabulation of IQ changes with age, and the rate of mental maturation by Ss of different levels of ability. The book is both a research report and a handbook for members of professional groups who evaluate the performance of individuals on the Stanford-Binet or comparable tests of intelligence. Application of mental assessment to typical problems in pre-adoption testing, educational applications, and counseling applications are discussed.—*L. G. Schmidt.*

6707. Torrance, E. Paul. (U. Minnesota, Minneapolis) **Cultural discontinuities and the development of originality of thinking.** *Except. Children*, 1962, 29(1), 2-13.—For purposes of assessment of originality of thinking, approximately 1000 pupils in Grades 1 through 6 were studied in each of these cultural sub-divisions: Australia, United States-Negro, Germany, India, Samoa, and the United States. In our culture and similarly elsewhere except in Samoa, the generalized development curve of the creative thinking abilities contained discontinuities: drops in creativity occurred at beginning kindergarten, end of 3rd grade or beginning 4th, during 7th grade, and a slight drop or leveling off at end of high school. These stages were felt to correspond to "Harry Stack Sullivan's (1953) conceptualization of the stages of development of inter-personal skills."—*J. Z. Elias.*

6708. Torrance, E. P. (U. Minnesota) **Non-test ways of identifying the creatively gifted.** *Gifted Child Quart.*, 1962, 6(3), 71-75.—Factors

hindering revelation of creative abilities through tests are presented. The discrepancies between overt exploratory behavior of children in and out of school justifies a redefinition of creative behavior. Parent descriptions of creative children and a check list developed by teachers and counsellors attending a creative thinking seminar provided the data from which tentative definitions were developed. Specific non-test devices itemized were play activities, school tests, curiosity behavior, reaction to crises, and student self ratings on sensitivity to problems, flexibility, fluency originality, elaboration, and redefinition types of thinking.—*N. M. Chansky.*

PERSONALITY MEASUREMENT

6709. Anderson, Wayne; Kuncze, Joseph, & Baxter, John. (Jefferson Barracks VA Hosp.) **Maze score and job performance in psychiatric patients.** *J. counsel. Psychol.*, 1962, 9(2), 173-175.—Scores on a circular pencil maze test were related to job performance. "... variables describing work performance are more highly interrelated among each other than they are to variables imputed to describe ... personality functioning."—*E. R. Oetting.*

6710. Armatas, James P., & Collister, E. Gordon. (VA Cent., Wadsworth, Kan.) **Personality correlates of SVIB patterns.** *J. counsel. Psychol.*, 1962, 9(2), 149-154.—The Edwards Personal Preference Schedule, the 16 Personality Factor test, the Inventory of Beliefs, placement scores, grade point, and course grades are compared for groups showing differences in response set on the SVIB. Partial support for personality types based on response sets is presented.—*E. R. Oetting.*

6711. Furuno, Setsu. (New York U.) **Mid-group respondents to the F Scale and their relationship to high and low authoritarianism.** *Dissert. Abstr.*, 1962, 22(11), 4079.—*Abstract.*

6712. George, E. A., & Baby, E. T. (Kerla U., India) **Study of personality: Dimensional approach. Part I.** *J. voc. educ. Guid., Baroda*, 1962, 8(4), 7-16.—A report largely summarizing the work of Eysenck regarding personality measurement (neuroticism factor, extroversion-introversion, normal-psychotic dimension). It is planned to duplicate this work on an Indian population. In addition, the authors hope to correlate the Eysenck tests and factors against an outside criterion (psychiatrist judgments). The MMPI is also to be administered.—*W. L. Barnette, Jr.*

6713. Griffith, Albert Victor. (U. Alabama) **Reconciliation of contradictions and self-expressive styles as related to choice of a fascination group.** *Dissert. Abstr.*, 1962, 22(7), 2465-2466.—*Abstract.*

6714. Hart, H. C. (Bryce Hosp., Tuscaloosa, Ala.) **Piaget test of immanent justice responses compared for several patient-nonpatient populations.** *J. genet. Psychol.*, 1962, 101(2), 333-341.—2 tests from Piaget's concept of immanent justice were administered to 300 Ss, including 48 college students, 80 applicants for employment at a state hospital, 72 hospitalized nonschizophrenic, and 100 hospitalized schizophrenic patients, of both sexes. Regression to an earlier concept of justice was seen in the male Ss in a regular progression from the college

group to the hospitalized schizophrenic group. Such a progression was not seen in the female group. A significant difference between the sexes in the college and employee groups but not for the hospitalized groups was found.—*Author abstract.*

6715. Jenkins, Thomas N. (New York U.) **Measurement of the primary factors of the total personality.** *J. Psychol.*, 1962, 54(2), 417-442.—As the result of a 20-year investigation of personality structure, 128 primary trait factors were isolated. The procedure for this long-term study was methodical exploration followed by cluster or factor analysis. A basic conflict emerged between the results of content analysis and quantitative analysis. This conflict eventuated in a new approach in dealing with personality variables. After the 128 trait factors were thoroughly validated by means of diverse sampling, scoring categories were developed for each primary trait. Trait descriptions are included in this article.—*Author abstract.*

6716. Khan, Lilian. (Calcutta, India) **Factor analysis of certain aptitude and personality correlates.** *Indian J. Psychol.*, 1962, 37(1), 27-38.—Stone's Structured-Objective Rorschach Test, the Guilford-Zimmerman Temperament Survey, and Seigal's Multiple Aptitude Test battery were administered to 110 salaried workers of the Kaiser Steel Corporation of Fontana, California. The 34 variables, after conversion to stanines, were factor analyzed; and an orthogonal solution was obtained by verimax method using the Iliac computer. The author identifies 11 factors, 8 of which appear to correspond with factors hypothesized in advance, thereby giving evidence for construct validity of the tests utilized. (31 ref.)—*J. T. Cowles.*

6717. Knapp, R. H., Gewirtz, H., & Holzberg, J. D. (Wesleyan U.) **Some personality correlates of styles of interpersonal thought.** *J. proj. Tech.*, 1962, 26(4), 398-403.—"This paper described the rationale and development of an Interpersonal Transactional Inventory [ITI] consisting of diadic propositions of four pronouns as subject and object and four acts or verbs linking subject and object in an interpersonal transaction." 33 personality measures from 6 psychological tests comprised the independent variables which were factorially related to measures from the ITI. Some suggestions for future research are posed by the authors.—*A. F. Greenwald.*

6718. Lichtenstein, Edward. (U. Michigan) **The relation of three cognitive controls to some perceptual and personality variables.** *Dissert. Abstr.*, 1962, 22(7), 2467.—*Abstract.*

6719. Luoto, Kenneth. (U. Pittsburgh) **The differential effects of personality, placebos and suggestion on timing behavior.** *Dissert. Abstr.*, 1962, 22(11), 4083-4084.—*Abstract.*

6720. McGee, Richard K. (Moccasin Bend Psychiatric Hosp., Chattanooga, Tenn.) **Response style as a personality variable: By what criterion?** *Psychol. Bull.*, 1962, 59(4), 284-295.—Investigation of response variables as predictors of underlying personality traits of the responders "have provided meaningful abstract descriptions of the personalities of individuals with certain response style tendencies, but little real defensible data to tie response styles to the criterion of independently measured behavior."

Specific recommendations for future research strategies are proposed.—*W. J. Meyer.*

6721. Merz, F. **Über die Beurteilung der persönlichen Eigenart unserer Mitmenschen.** [Judgment of personal characteristics of associates.] *Arch. ges. Psychol.*, 1962, 114(2), 187-211.—Each of 71 male high school graduates, rating on a 7-point scale, judged his best friend, his most esteemed superior, the most unpleasant person he had ever known, 3 other males, and finally himself on 40 different personality traits. Results show the judgments evidently are influenced by and depend on the existing social relations between the person rating and the person being judged. The author attributes lack of agreement between judgments of the same person to inconsistency in the behavior of the persons being rated rather than on the incorrectness of the various raters in their judgments.—*K. J. Hartman.*

6722. Mitchell, James V., Jr. (U. Texas) **An analysis of the factorial dimensions of the Bills' Index of Adjustment and Values.** *J. soc. Psychol.*, 1962, 58(2), 331-337.—The 49 items of the self-concept section of the Bills' Index of Adjustment and Values were subject to a centroid factor analysis. 7 factors were extracted and rotated by Kaiser's Varimax method. The factors were identified as (a) Freedom from Anxiety, (b) Motivation for Intellectual Achievement, (c) Offensive Social Conduct, (d) Social Poise and Self Confidence, (e) Warm-Hearted Attitude toward Others, (f) Impersonal Efficiency, and (g) Dependability. In interpreting the results it was pointed out that many of these factors have their parallels in factors reported by Cattell and Eysenck. Several practical implications for the index were also noted: (a) there is little factorial justification for the use of a single "self-concept" score, (b) the "self-acceptance" score may represent as many different patterns of acceptance-rejection as there are combinations of factors for the self-concept section of the index, and (c) consideration should be given to the development of new scoring methods which would reflect the basic factorial structure of the index.—*Author abstract.*

6723. Rimland, Bernard. (USN, San Diego) **Personality test faking: Expressed willingness to fake as affected by anonymity and instructional set.** *Educ. psychol. Measmt.*, 1962, 22(4), 747-751.—In response to both signed and unsigned questionnaires, "about two-thirds of a sample of 873 students stated they would respond honestly or essentially with honesty. About one-fourth indicated they would shade their answers to some extent, and 7% admitted to all-out falsification." Other research has demonstrated the effect of instruction-induced response set on willingness to fake.—*W. Coleman.*

6724. Schlicht, William John. (New York U.) **Differences in learning and selective recall as related to need achievement.** *Dissert. Abstr.*, 1962, 22(11), 4087.—*Abstract.*

6725. Schulberg, H. C., & Tolor, A. (Fairfield State Hosp.) **The "meaning" of the Bender-Gestalt Test designs to psychiatric patients.** *J. proj. Tech.*, 1962, 26(4), 455-461.—Hospitalized psychiatric patients rated each Bender-Gestalt figure on 20 scales of the Semantic Differential and responded differentially to the 9 Bender figures. However, 4 diagnostic groups did not differ in the meanings

attributed to the designs, so that the stimulus value of the figures does not appear to influence the quality of reproduction.—*A. F. Greenwald.*

6726. **Smith, Madorah E.** (U. Hawaii) The values most highly esteemed by men and women in *Who's Who* suggested as one reason for the great difference in representation of the two sexes in those books. *J. soc. Psychol.*, 1962, 58(2), 339-344.—The hypothesis was that those values esteemed more highly by men would be found to be more frequently associated with the occupations or careers of persons listed in *Who's Who in America* and a relatively higher proportion of women listed would be found following careers or occupations which have been found to be associated with aesthetic, social, or religious values; those values which women have been found to value more highly. Studies based on the Allport-Vernon-Lindsey Scale of Values were used in assigning the different occupations which the men and women in *Who's Who in America* were listed as following. The hypothesis was confirmed.—*Author abstract.*

6727. **Waters, L. K., & Wherry, R. J., Jr.** (USN School Aviation Medicine) The effect of intent to bias on forced-choice indices. *Personnel Psychol.*, 1962, 15(2), 207-214.—Indices reflecting varying degrees of response bias were obtained from check-list administrations of a sample of statements incorporated into forced-choice blocks and administered to 3 independent groups under instructions designed to induce varying degrees of response bias. Correlations between index deviation values and frequencies of statement choice were of greater magnitude when the degree of response bias in the check-list and forced-choice administrations was similar.—*A. S. Thompson.*

6728. **Weiss, Robert Frank, & Passamanick, Benjamin.** (Ohio State U.) Individual and group goals: A factor analysis. *J. soc. Psychol.*, 1962, 58(1), 131-139.—Jewish college students answered a questionnaire concerning their aspirations for themselves and for American Jews in 6 goal areas. Also included in the analysis were indices of emotion aroused by individual and group problems, perceived controllability of such problems, cooperation-conflict in the achievement of goals, rewards of group membership, and fear of group sanctions and alienation. The 50 × 50 matrix of intercorrelations was factored by the centroid method. In support of a previous study, a factor concerned with hopes, intentions, and "trying" (but not expectations), and extending across both individual and group goals, was obtained. Emotion aroused by individual or group problems, fear of group sanctions, and controllability had high loadings on this factor, supporting the interpretation of a drive dimension. Other factors included Judgment (expectation), Individual vs. Group Goals, and Cooperation-Competition.—*Author abstract.*

Inventories

6729. **Banerjee, Debabrata, & Mallick, Amal K.** (Calcutta, India) Form of Bengali language as a determinant of ideas contained in the items of a foreign personality inventory. *Indian J. Psychol.*, 1962, 37(1), 23-26.—Ratings by 12 judges are compared for the adequacy of translation of items of an academic English personality inventory (Eysenck)

into academic and colloquial Bengali, respectively.—*J. T. Cowles.*

6730. **Bell, Richard Q.** (National Inst. Mental Health) Isolation of elevation and scatter components in personality and attitude questionnaires. *Educ. psychol. Measmt.*, 1962, 22(4), 699-713.—Cronbach and Gleser's analysis of profile elements into elevation, scatter, and shape was applied. The procedure used involved "obtaining a measure of the shape of the subject's item response profile by standardizing responses using the subject's own mean and standard deviation of item weights for response categories endorsed." Since general response tendencies may affect item intercorrelations and scale homogeneity, isolation of elevation and scatter components in inventories is urged.—*W. Coleman.*

6731. **Edwards, Allen L., & Diers, Carol Jean.** (U. Washington) Social desirability and conflict. *J. soc. Psychol.*, 1962, 58(2), 349-356.—Male and female Ss were divided into high and low groups on the basis of scores on Edwards' Social Desirability scale (SD). All 4 groups of Ss had previously taken the Edwards Personal Preference Schedule (EPPS) with permission to avoid responses to difficult choices. 4 sets of 20 items each were selected from the EPPS, 2 containing statements with socially undesirable and 2 with socially desirable scale values in an effort to represent avoidance-avoidance and approach-approach conflicts. The dependent variable was the percentage of no-choice responses to each item. The trend of the set means was much the same for each group and none of the interactions was significant. Choosing between pairs of socially undesirable statements was more difficult than between statements with socially desirable scale values. The probability of a no-choice response correlated $-.85$ with the average social desirability scale values of the pairs of statements. The tendency to give no-choice responses appears to qualify as a response set, which was found to be highly reliable and only slightly correlated with scores on the SD scale and the number of "?" responses to the items in Welsh's Repression scale.—*Author abstract.*

6732. **Garrison, Karl C., & Scott, Mary Hughie.** (U. Georgia) The relationship of selected personal characteristics to the needs of college students preparing to teach. *Educ. psychol. Measmt.*, 1962, 22(4), 753-758.—The Edwards Personal Preference Schedule (EPPS) was given to 482 women education students ranging from sophomores to 1st-year graduates. The mean scores for the 15 personal needs measured by the EPPS were compared with 12 "personal characteristics." These included such variables as ordinal of birth in family, educational level of each parent, father's occupation, and major reason for college attendance. Of 180 F-tests, 23 were significant at the .01 level and 15 at the .05 level. "The need for affiliation was unrelated to any of the twelve personal characteristics." It is suggested that the lack of marked trends may be attributable to the limited validity of the EPPS for measuring needs.—*W. Coleman.*

6733. **Hartley, Raymond E., & Allen, Robert M.** (U. Miami) The Minnesota Multiphasic Personality Inventory (MMPI) and the Edwards Personal Preference Schedule (EPPS): A factor analytic study. *J. soc. Psychol.*, 1962, 58(1), 153-

162.—The raw scores of the MMPI and the EPPS records of 130 male and female college students were factor analyzed. The purposes were to ascertain the presence of a validity factor common to both inventories and whether these 2 instruments were sufficiently different factorially as to be evaluating personality dimensions with little overlap. 10 factors were extracted, including a validity factor. Of the 10 factors, 4 showed no overlap in terms of individual scale variables, 1 factor appeared equally on both inventories, and the remaining 5 factors displayed varying degrees of freedom and overlap for both tests.—*Author abstract.*

6734. Mattoon, Paul F. After-contraction as a function of extraversion and central inhibition. *Acta psychol., Amsterdam*, 1962, 20(2), 121-127.—Do introverts have a longer period of after-contraction than extraverts? 17 paid Ss, 18-45, took the Maudsley Personality Inventory, a sway test, and a spiral aftereffects test as well as an after-contraction test. The theoretical prediction was confirmed.—*G. Rubin-Rabson.*

6735. Solomon, Leonard, & Klein, Edward. (Boston U.) The relationship between agreeing response set and social desirability. *J. abnorm. soc. Psychol.*, 1963, 66(2), 176-179.—3 measures of response set and 5 content scales were administered to 125 schizophrenic patients and 135 college Ss. The data indicate that the Overall Agreement Score which ostensibly measures an agreeing response set also contains negative social desirability (SD). SD_{18} also appears to have a naysaying element in it. The results also show that truly balanced measures of acquiescence and Social Desirability might very well be orthogonal to each other and support both sets of authors' contentions that their scales are not necessarily associated with elements of the other response set.—*Journal abstract.*

6736. Super, Donald E., & Mowry, James G., Jr. (Columbia U.) Social and personal desirability in the assessment of work values. *Educ. psychol. Measmt.*, 1962, 22(4), 715-719.—"To determine the social desirability of 15 work value descriptions, 23 male clients of a YMCA vocational guidance center and 14 male and female graduate students at Teachers College, Columbia University, completed an inventory of work values in terms of social desirability." The values were rated in accordance with the generally accepted value hierarchy. Through the use of a 2nd group of 26 male counseling clients, significant differences were obtained in rating altruism depending upon whether the instructions encouraged social desirability or personal desirability. No significant differences were obtained for the other 13 values when the 2 instructions were used.—*W. Coleman.*

Projective Methods

6737. Hirt, Michael. (Ed.) Rorschach science: Readings in theory and method. New York: Free Press Glencoe, 1962. ix, 438 p. \$8.50.—Presents a collection of papers designed to encourage a more critical evaluation of the Rorschach and to clarify some of the major problems of behavior measurement through projective techniques. Included papers confront broad methodological issues and not specific clinical applications. Within this general methodological framework, problems of validity, reliability,

interpretation and scoring, as well as the current status of the Rorschach are considered. (193-item bibliogr.)—*A. F. Greenwald.*

6738. Ismir, A. A. (U. North Dakota) The effects of prior knowledge of the Thematic Apperception Test on test performance. *Psychol. Rec.*, 1962, 12, 157-164.—An experimental group was told that the test indicates presence or absence of mental illness and various types of hidden problems. 5 pictures out of the standard set were then administered to the experimental group and a control group matched for scores on the Social Desirability Scale. Ss with prior knowledge gave "healthier" responses.—*R. J. Seidel.*

6739. Jenkins, Thomas N. (New York U.) The primary trait anatomy of the MMPI. *J. Psychol.*, 1963, 55(1), 49-61.—This was a primary trait analysis of the validity, clinical, and nonclinical scales of the MMPI. These scales were correlated with 128 primary trait scores of the Jenkins Global Personality Inventory. The trait scores were classified into 8 superfactorial syndromes, such as, adrenergic, cholinergic, and sensory ascendance. The Ss were 104 college women and 151 college men. The results were clear-cut and highly significant statistically. The greatest concentration of trait loadings for the validity scales was in the adrenergic syndrome. The analyses showed that the D scale is a composite of 2 independent sets of traits, and hence should be broken down into 2 subscales. The trait patterns for Hs, Pa, Pt, and Sc showed that these scales constitute a trait family. Trait patterns clearly differentiate Hy from Hs. The Si scale was a composite comprising 2 independent groups of traits and hence, for maximal effectiveness, should be separated into 2 subscales. Uniformity of signs within syndromes indicated that these scales are more closely related to the common component of the syndrome than to the specific trait factors.—*Author abstract.*

6740. Korner, Ija N., Allison, Roger B., Jr., & Zwanziger, Max D. (U. Utah Coll. Medicine) Stimulus size and Rorschach responses. *J. Psychol.*, 1962, 54(2), 491-494.—A comparison of responses to Rorschach Cards I, III, and VI and 6' X 8' enlargements of these cards was made to determine the influences of size upon percepts. Both sets were administered to 38 Ss in a counterbalanced design. Total time and total number of words used in responding were significantly greater in the case of the enlarged cards. The remainder of the experimental and standard scoring categories failed to demonstrate a size difference.—*Author abstract.*

6741. Kumar, Pramod. (Ranchi, India) The Rorschach test in psychoneurotic and normal groups. *Indian J. Psychol.*, 1961, 36(4), 169-172.—The Rorschach test was administered in India to normal and psychoneurotic Ss, matched by age and sex, in an effort to discover whether the 2 groups might be differentiated on any scores derived by the Rapaport technique. Only the F+ score had a significant chi-square value for such differentiation.—*J. T. Cowles.*

6742. McCully, R. S. (Cornell U. Medical Coll.) Certain theoretical considerations in relation to borderline schizophrenia and the Rorschach. *J. proj. Tech.*, 1962, 26(4), 404-418.—Differences in the stimulus value of the psychiatric and Rorschach

examinations are an important variable in evaluating borderline cases. The author suggests use of a "process analysis" which focuses attention on what the individual is experiencing and how he is behaving at a given moment in time in relation to the whole situation. A case record is presented to illustrate the process.—*A. F. Greenwald.*

6743. Nymna, Lawrence. (New York U.) The relationship between the ability to perceive human movement response in the Barron Ink Blot test and the reaction to delay in word-naming and reaction time situations. *Dissert. Abstr.*, 1962, 22(11), 4085.—*Abstract.*

6744. Pflaum, John H. (Wayne State U.) Restricted figure drawing as a projective measure of personality. *J. soc. Psychol.*, 1962, 58(2), 283-287.—This study attempted to measure personality traits by the use of a projective drawing task of a structured nature. The test consists of a series of nouns which the S represents by drawing lines from one to another of a pattern of 25 dots. The Guilford-Zimmerman Temperament Survey was used as a criterion for the validity of the drawing task. The scoring categories of the drawing task were Symmetry, Perspective, Motion, and Inadequacy. A high Symmetry score reflects an "extraverted" personality. "Introversion" was characterized by use of Perspective. A high Motion score related to impulsiveness. Inadequate drawings were a sign of hostility. The results partially justify the thesis that this drawing task relates to personality and that it merits further consideration.—*Author abstract.*

6745. Quirk, D. A., Quarrington, M., Neiger, S., & Slemmon, A. G. (Ontario Hosp., Toronto) The performance of acute psychotic patients on the Index of Pathological Thinking and on selected signs of idiosyncrasy on the Rorschach. *J. Proj. Tech.*, 1962, 26(4), 431-441.—In addition to the Index of Pathological Thinking in the Rorschach which distinguished between psychotic and nonpsychotic groups, several additional Rorschach signs were found which occurred with relatively higher frequency in the records of acute psychotics. A 10-item sign list was able to identify correctly approximately $\frac{1}{2}$ of the acute psychotic group.—*A. F. Greenwald.*

6746. Ramer, John Carl. (U. Washington) The Rorschach barrier score and social behavior. *Dissert. Abstr.*, 1962, 22(11), 4086.—*Abstract.*

6747. Rosenthal, M. (Boston U. School Medicine) Some behavior correlates of the Rorschach experience-balance. *J. proj. Tech.*, 1962, 26(4), 442-446.—In an attempt to validate the psychological significance of the experience balance, the performance of movement-predominant and color-predominant Ss on a Match Stick test was compared. The M group showed significantly more deliberateness and caution in its approach while the C group was characterized by significantly more motor activity and less response delay.—*A. F. Greenwald.*

6748. Stein, H. (New Jersey Diagnostic Cent., Menlo Park) An analysis of two components entering into Rorschach reliability values. *J. proj. Tech.*, 1962, 26(4), 474-477.—Results tend to suggest that the stimulus values of the blot are less important than inner determinants in the development of the individual's response pattern on the Rorschach.—*A. F. Greenwald.*

6749. Turner, G. C., & Coleman, J. C. (U. California, Los Angeles) Examiner influence on Thematic Apperception Test responses. *J. proj. Tech.*, 1962, 26(4), 478-486.—Examiner variables which might influence the nature of TAT responses elicited from Ss were studied. Qualitative and not quantitative differences were noted in the material elicited, suggesting that some examiners have a greater facility for obtaining diagnostically meaningful data. 4 personality traits of the examiners were studied and found to bear no relationship, to the amount or type of TAT responses elicited.—*A. F. Greenwald.*

PERSONALITY DIAGNOSIS

6750. Bräutigam, Walter. (U. Heidelberg, Germany) "Organwahl"—"Organsprache"—"Organ-spezifität." ["Choice" of organ—Organ "language"—"Determination" of an organ.] *Prax. Psychother.*, 1962, 7(6), 229-252.—Summary of a colloquium and the following discussion on the significance of the organ or physiological system which the mentally ill "choose" as a symptom to "express" their disease. The comments, made at the 1962 Psychotherapy Week in Lindau, Germany, are a cross-section of the views of Germanic psychotherapists on the subject.—*W. Swartley.*

6751. Brickenkamp, Rolf. Einige theoretische Grundzüge und praktische Methoden der Zuverlässigkeitsschätzung psychodiagnostischer Verfahren. [Some theoretical characteristics and practical methods of reliability estimation of psychodiagnostic tests.] *Psychol. Rdsch.*, 1963, 14(1), 13-25.—Based on studies of Cronbach, Guilford, Gulliksen, and Thurstone the reliability coefficient, different methods of computation, and problems connected with these methods are discussed.—*W. J. Koppitz.*

6752. Bruhn, J. G. An operational approach to the sick-role concept. *Brit. J. med. Psychol.*, 1962, 35(4), 289-298.—Ss were 129 adult neurotics making their initial approach to a psychiatric clinic. Patients were interviewed and ratings were made of their conception of the sick role. "The findings showed that patients with more positive conceptions of their sick role have long successful therapies. The converse did not hold true. Patients' sick-role conceptions were shown to be influenced by their social-class positions. Higher-class patients were found to have more positive sick-role conceptions than lower-class patients."—*C. L. Winder.*

6753. De, Bimaleswar, & Giri, G. P. (Muzaffarpur, India) A study of the diagnostic validity of the Sentence Completion Test. *Indian J. Psychol.*, 1962, 37(2), 93-98.—J. M. Sacks' Sentence Completion Test (SCT) was translated into Hindi and administered to a group of 40 college students and to a group of 25 institutionalized orphans; all Ss were aged 18 or over. Sacks' clinical rating scheme was used for scoring the 20 completed sentences of each S. Significant chi-square values were found separately for each group of Ss for the distribution of "healthy," "unhealthy," and "neutral" responses within each of the 4 personality domains of the test. There was a preponderance of "healthy" responses in the college group. These results were interpreted as indicating, contrary to Symonds, that the SCT is not only descriptive but also evaluative. They also express caution concerning the subjectivity of scoring and note

the greater potency of certain sentences to evoke "unhealthy" responses.—J. T. Cowles.

6754. Exner, J. E., Jr. (Bowling Green State U.) A comparison of the human figure drawings of psychoneurotics, character disturbances, normals, and subjects experiencing experimentally-induced fear. *J. proj. Tech.*, 1962, 26(4), 392-397.—The results of a comparison of figure drawings done by each of these groups tend to indicate that global ratings of figure drawings are more useful and effective diagnostically than any single sign approach.—A. F. Greenwald.

6755. Fernald, Lloyd Dodge, Jr. (Cornell U.) Client distortion of psychological test data in the test-interpretation interview. *Dissert. Abstr.*, 1962, 22(7), 2457.—Abstract.

6756. Kiener, Franz. Hand, Gebärde und Charakter. [Hand, gesture and personality.] Munich, Germany: Reinhardt, 1962. 364 p. DM 24.—The anatomy and the movements of the hand are interpreted from a traditional characterological point of view.—J. C. Brengelmann.

6757. Kiresuk, Thomas Jack. (U. Minnesota) The effect of test sophistication on the diagnostic validity of the Minnesota Multiphasic Personality Inventory and the Rorschach with paranoid schizophrenics. *Dissert. Abstr.*, 1962, 22(8), 2875.—Abstract.

6758. Kirk, Samuel A., & Bateman, Barbara. (U. Illinois) Diagnosis and remediation of learning disabilities. *Except. Children*, 1962, 29(2), 73-78.—"The current research reported here has dealt with a psychoeducational system of diagnosing those learning disabilities in children which result from a possible cortical dysfunction and/or emotional disturbance."—J. Z. Elias.

6759. Knehr, Charles A. (Cornell U. Medical Cent.) Factor analyses of schizophrenic and organic test data. *J. Psychol.*, 1962, 54(2), 467-471.—Similar factor patterns were observed for schizophrenics and organics on the same battery of tests, suggesting that cognitive organization is not different between the patient groups. The data provide a further basis for the previous contention that to discriminate organicity as a factor in observed impairment, tests independent of g are superior.—Author abstract.

6760. Kumar, Pramod. (Ranchi, India) The Rorschach test in depressive and normal groups. *Indian J. Psychol.*, 1962, 37(2), 89-92.—This is a repetition of the author's previously reported trial of the Rorschach test for differentiation of mental patient from normal Ss (see 37: 6741), except that the patients in the present study were 37 depressive cases, and the normals were a group of 37 Ss matched with the patients in age and sex. Of 19 (Rapoport) types of score, 4 differentiated the 2 groups with chi-square values at the .001 level, and 5 other types of score yielded chi-square values at the .01 level of significance.—J. T. Cowles.

6761. Lorr, Maurice. (Catholic U., Washington, D. C.) Measurement of the major psychotic syndromes. *Ann. N. Y. Acad. Sci.*, 1962, 93, 851-856.—Development of the Inpatient Multidimensional Psychiatric Scale (IMPS) is described. 10 syndromes have been derived including excitement, hos-

tile belligerence, paranoid projection, grandiose expansiveness, perceptual distortion, anxious intropunitiveness, retardation and apathy, disorientation, motor disturbance, and conceptual disorganization. Each of these is described. High interrater reliability, inter-scale consistency, and moderate 6-week retest reliability are reported.—B. S. Aaronson.

6762. Marks, P. A., & Seeman, W. (Kansas U. Medical Cent.) On the Barnum effect. *Psychol. Rec.*, 1962, 12, 203-208.—An attempt to refine its meaning by restricting the concept to diagnostic test-inferences where descriptions are so gross or trivial that the test is really superfluous for description. In addition, the intent of the clinician should not be part of the criterion nor should flattering statements. A procedure is suggested for identifying the effect when it occurs.—R. J. Seidel.

6763. Neiger, S., Slemmon, A. G., & Quirk, D. A. (Toronto Psychiatric Hosp.) The performance of "chronic schizophrenic" patients on Piotrowski's Rorschach sign list for organic CNS pathology. *J. proj. Tech.*, 1962, 26(4), 419-428.—"It was observed that, although the chronic schizophrenics tended to score slightly lower on the scale than the epileptics, about half of the schizophrenics obtained scores in the 'organic' range. This finding tends to contradict previous findings which reported a low false positive rate for the Piotrowski sign list." The authors suggest that regression is the process measured by Piotrowski's scale, and that it should be used with caution in predicting brain damage in a psychiatric population.—A. F. Greenwald.

6764. Phillips, Alan Richard. (Louisiana State U.) The dimension of masculinity-femininity as related to psychopathological groups. *Dissert. Abstr.*, 1962, 22(9), 3268.—Abstract.

6765. Schaie, K. W. (U. Nebraska) The performance of mentally defective children on the Color Pyramid Test. *J. proj. Tech.*, 1962, 26(4), 447-454.—It is posited that the Color Pyramid Test may be useful in differentiating between defective and normal Ss. An interpretation of some of the emotional differences noted between the 2 groups is also offered.—A. F. Greenwald.

6766. Tauber, Lewis Earlen. (Purdue U.) Time concern and "time complexes" among normals, neurotics, and psychotics with possible applications to psychotherapy. *Dissert. Abstr.*, 1962, 22(7), 2470.—Abstract.

6767. Tuckman, Jacob, & Kleiner, Robert J. (Philadelphia Dept. Public Health) Discrepancy between aspiration and achievement as a predictor of schizophrenia. *Behav. Sci.*, 1962, 7(4), 443-447.—A discussion of the existing measures of social class, occupation, and education as measures of ordering groups with respect to schizophrenic. A discrepancy Index based upon the discrepancy between aspiration and achievement is proposed as a more useful measure. Data is presented regarding the discrepancy between education and occupation as a predictor of schizophrenia although other types of discrepancies are noted as potentially involved in any overall measure.—J. Arbib.

6768. Uherik, A. (Slovenskej Akad. Vied, Bratislava, Czechoslovakia) Možnosti využitia metodiky KGR v diagnostickej praxi. [The possibilities of

using the method of galvanic skin reflex in diagnostic practice.] *Psychol. Stud., Bratislava*, 1961, 3, 157-194.—Descriptions of various pathological patterns of galvanic skin reactivity in psychotic patients with differing diagnoses. The absence of GSR as one of the components of the orientation reflex indicates pathological changes in the connective function of the cerebral cortex. Derangement of the connective function in the sphere of the first signal system is shown in cases where no reactions on sound stimuli occurred, a derangement on the level of 2nd signal system in cases where no reactions on verbal stimuli occurred. (Russian & English summaries)—*V. Břicháček*.

6769. Zucker, Luise J. (Postgraduate Cent. Psychotherapy, NYC) **Evaluating psychopathology of the self.** *Ann. N. Y. Acad. Sci.*, 1962, 96(3), 844-852.—Hazy, fluid ego boundaries are found with psychosis and especially schizophrenia. Projective tests may be used to measure strength of ego boundaries. The author stresses the Rorschach, the Mosaics, and the Figure Drawings. Criteria for ego weakness include fusion of different realms of cognitive experience, the tendency to multiple identifications, fluctuating body image, and extension of the ego field into other fields. Each criterion is illustrated. Good ego boundaries suggest good prognosis in schizophrenia. The relation of ego boundaries to prognosis is suggested.—*B. S. Aaronson*.

PERSONALITY ADJUSTMENT

6770. Dachowski, Marjorie McCormick. (U. Illinois) **Inconsistency as measured by direct, indirect and projective tests and its relationship to general neuroticism.** *Dissert. Abstr.*, 1962, 22(10), 3740.—*Abstract*.

6771. Gillespie, James Francis. (U. Pittsburgh) **Aggression in relation to frustration, attack, and inhibition.** *Dissert. Abstr.*, 1962, 22(11), 4080-4081.—*Abstract*.

6772. Henrichs, Theodore Fred. (U. North Carolina) **The effect of sensory reduction and personality information on self-concept and personal adjustment.** *Dissert. Abstr.*, 1962, 22(8), 2874-2875.—*Abstract*.

6773. Jensen, Arthur R. **Extraversion neuroticism and serial learning.** *Acta psychol., Amsterdam*, 1962, 20(2), 69-77.—130 university students scoring either high or low on the neuroticism and extraversion scales of the Maudsley Personality Inventory were compared on serial learning tasks paced at different speeds for difficulty. A significant relation between difficulty and neuroticism was found, although for the easier task high and low N's did not differ appreciably. The difficult task hindered the high N but not the low N group. Extraversion showed no significant relation with the learning variables. No systematic differences were found between the shapes of the serial-position curves of any of the groups.—*G. Rubin-Rabson*.

6774. Madigan, Francis C. (Xavier U., Philippines) **Role satisfactions and length of life in a closed population.** *Amer. J. Sociol.*, 1962, 67(6), 640-649.—In a comparative study of an order of Roman Catholic priests and white American males of the general population it was found that, in spite of high life stresses, priests enjoyed a more favorable

mortality experience. This suggests that high role satisfactions, as found among priests, may be related to this favorable mortality experience and it underlines the need for projective, quantitative research on this problem.—*R. M. Frumkin*.

6775. Nuttin, Joseph. **Psychoanalysis and personality: A dynamic theory of normal personality.** (3rd ed.) (Trans. by G. Lamb) New York: New American Library, 1962. 335 p. \$.75 (paper).—Originally published in 1953, this revised edition is now published as one of a series of paperbacks comprising a "treasury of Catholic thought for the modern reader."—*C. T. Morgan*.

Anxiety

6778. Bogen, Iver. (U. Denver) **Some operational definitions of intolerance of ambiguity and their relationship to adaptation and anxiety.** *Dissert. Abstr.*, 1962, 22(10), 3738.—*Abstract*.

6779. Cattell, Raymond, B. (U. Illinois) **Advances in the measurement of neuroticism and anxiety, in a conceptual framework of unitary-trait theory.** *Ann. N. Y. Acad. Sci.*, 1962, 93, 815-839.—The role of factor analysis is explicated via the concept of anxiety. The sources of anxiety are noted. Bound and unbound anxiety, trait and state concepts are compared. Effort stress differentiates from anxiety in its relationship to reality. A simple additive model fits the data and applies across contexts. Factor traits are dynamic concepts. The efficacy of factor scales in diagnosis is stressed as well as their provision of richer understanding of conditions such as sociopathy and neuroticism. Batteries give better measurement than single scales. Factor analysis gives definition to clinical concepts. (24 ref.)—*B. S. Aaronson*.

6780. Diamant, J. (Psychiatrická klinika KU, Praha) **K otázce navozování a zjišťování úzkosti.** [On the question of evoking and determining anxiety.] *Psychol. Stud., Bratislava*, 1961, 3, 211-226.—A review of methodological problems of experimental research on how anxiety influences human behavior. Special regard is given to the diagnosis and psychotherapy of psychiatric patients and in elaborating the fundamental principles of mental hygiene. (Russian & English summaries)—*V. Břicháček*.

6781. Funk, Melvin Frank. (U. Illinois) **Moral judgments and neurosis.** *Dissert. Abstr.*, 1962, 22(10), 3740-3741.—*Abstract*.

6782. Scheier, Ivan H. (Inst. Personality & Ability Testing, Champaign, Ill.) **Experimental results to date from the standpoint of the clinician.** *Ann. N. Y. Acad. Sci.*, 1962, 93, 840-850.—A follow-up to Cattell's paper on neuroticism and anxiety (see 37: 6779). The study of anxiety lacks "coordination, communication, and systematic interrelation of existing information." The way in which tests are built to capture a clinical concept is summarized. Anxiety

is only one of many personality variables. The state and the trait of anxiety is not identical. Anxiety norms are shown by diagnosis and occupation. Anxiety varies among nations with wellbeing. It has a U-shaped distribution with age and is lower in males, hypnotizable Ss, and volunteers for experiments. Extremes of anxiety impair learning and it may be lessened by moderate environmental challenge or psychotherapy. Physiological correlates are noted. (19 ref.)—*B. S. Aaronson.*

Defenses

6783. Breger, Louis. (Ohio State U.) **Conformity and the expression of hostility.** *Dissert. Abstr.*, 1962, 22(10), 3738-3739.—*Abstract.*

6784. Fuchs, Rainer. (Kiel, Diesterwegstr. 20, Germany) **Schmerz als signal für die Bedrohtheit von Leib und Leben.** [Pain as a threat signal in case of danger to life and limb.] *Z. exp. angew. Psychol.*, 1962, 9(3), 361-396.—A pain expectation affect was aroused in 16 Ss by Pavlovian conditioning. Interpretations of a series of unstructured pictures were compared before and after conditioning. A significant increase in responses expressing emotional concern with destruction and physical threat was observed in the postconditioning reports. Within the framework of an organized system of affective reactions pain is interpreted as a signal that the integrity of the body is in danger.—*W. J. Koppius.*

6785. Glass, David C., Horwitz, Murray; Firestone, Ira, & Grinker, Joel. (Research Cent. Human Relations, New York U.) **Birth order and reactions to frustration.** *J. abnorm. soc. Psychol.*, 1963, 66(2), 192-194.—A reanalysis of an experiment on the relation between frustration and aggression, employing 108 male undergraduates from New York University. The findings indicate that later born Ss react with greater annoyance to a frustrating agent than 1st born Ss. These results appear to contradict those reported in a previous study which found that 1st born males from Yale University react more strongly than later born males to frustrating acts by others. This discrepancy between New York and Yale college students in the domain of hostile behavior appears to parallel a similar inconsistency in the domain of affiliative behavior as reported in 2 recent studies. We suggest the consideration of sociocultural factors in any effort to interpret these differences, since we regard birth order, like birthplace, etc., as an "ecological" variable rather than a psychological one.—*Journal abstract.*

6786. Klein, G. S., Gardner, R. W., & Schlesinger, H. J. **Tolerance for unrealistic experiences: A study of the generality of cognitive control.** *Brit. J. Psychol.*, 1962, 53, 41-55.—This was previously abstracted (see 36: 5HL41G), but authorship in the abstract was incorrect.—*Editor.*

6787. Moulton, Robert W., & McNeil, Elton B. (U. Michigan) **The relationship of the socialization process to the handling of aggression in psychiatric patients.** *Pap. Mich. Acad. Sci. Arts Lett.*, 1957, 42, 289-297.—Data from "a continuing investigation of the relationship of the socialization process to the handling of aggression in psychiatric situations" have been obtained on a sample of male psychiatric patients and their mothers. Trends in the

data suggest that a greater proportion of the mothers of Ins (sons who turn their aggressive impulses inward on themselves) were separated from their male child before he was 2 years old than of the Outs (sons who characteristically expressed their aggression toward others). "Our analysis has focused on the internal experience of guilt and on shifts in the level of aspiration under conditions of success and failure."—*S. J. Lachman.*

6788. Waxenberg, Sheldon E., Dickes, Robert, & Gottesfeld, Harry. (Memorial Hosp. Cancer, NYC) **The Poetzl phenomenon re-examined experimentally.** *J. nerv. ment. Dis.*, 1962, 135(5), 387-398.—Poetzl believed that unreported portions of tachistoscopically-presented scenes were not observed because they were connected with repressed conflicting associations. The present experiment was designed to test such a hypothesis. Results did not lend support to it.—*N. H. Pronko.*

PSYCHOANALYTIC THEORY

6789. Bitter, Wilhelm. **Krisis und Zukunft der Frau.** [Crisis and future of woman.] Stuttgart, Germany: Ernst Klett, 1962. 314 p.—In this 10th report of sessions of the Stuttgart association "Arzt und Seelsorger" [Physician and Churchman], 17 papers and 3 discussions of the meetings in September 1961 and February-March 1962 are collected. Experts examine the consequences of the changing role of woman from the aspects of psychotherapy, medicine, sociology, education, and religion.—*E. Katz.*

6790. de Toledo, Luisa G. de Alvarez. **Psicoanálisis de la comunicación verbal.** [Psychoanalysis of verbal communication.] *Acta psiquiat. psicol. Argent.*, 1962, 8(1), 16-24.—The psychoanalytic interpretation of oral activity points to an unconscious identification of such acts with concrete oral, anal, urethral, and genital acts. The voice and spoken or heard words take on the unconscious value of these objects: milk, excrement, children, etc. Either the person listening or the one listened to are objects of the activity. By this analysis of verbal communication, the patient can be brought to the most primitive preverbal fantasies, in which even intrauterine fantasies can be activated.—*W. W. Meissner.*

6791. Feldman, S. S. **Blushing, fear of blushing, and shame.** *J. Amer. Psychoanal. Ass.*, 1962, 10(2), 368-385.—The desire to be the focus of attention is the key drive in blushers. Imposed inhibition of heterosexual drives is responded to in male blushers by assuming a feminine role, which also has to be repressed; the demand to be ashamed is then experienced. Females blush in desiring to have a male organ on the female body and not give up femininity. Female blushers are ashamed when they want attention as females. In therapy the patient establishes a working cooperation between the side of the ego turned toward the id and the side in contact with external reality.—*D. Prager.*

6792. Greenson, R. R. **On enthusiasm.** *J. Amer. Psychoanal. Ass.*, 1962, 10(1), 3-21.—Enthusiasm is differentiated from other varieties of elation. Several types of enthusiasm are distinguished and described. An attempt is made to formulate some of the meta-psychological elements making for the phenomenon of enthusiasm.—*D. Prager.*

6793. Heimann, Paula. *Bemerkungen zur analen Phase*. [Remarks on the anal phase.] *Psyche, Stuttgart*, 1962, 16(7), 420-439.—Narcissism is not simply the earliest libidinal position nor a quasi-physiological condition, but an active orienting attitude (toward experiences) that stems from innate, primordial ego capacities. Anal experiencing is the life historical prototype of creative ego achievements. For the first time an individual experiences his creative ability to obey an urge and at the same time learns to master its fulfillment outside of a dialogue with a partner who shares responsibility. Quite understandably such anal conflicts often reveal themselves as difficulties in writing.—E. W. Eng.

6794. Henry, George W. (Cornell U. Medical School, NYC) *Freud's pathography and psychoanalysis*. *Ann. N. Y. Acad. Sci.*, 1962, 96(3), 823-830.—Freud's views and concerns are traced to early childhood experiences, especially to the primal scene. Feelings about being Jewish and about his family's stability also determined his scientific activities. He suffered from neurosthenia, constipation, anxiety, depression, and migraine. He also had phobic reactions to high places, open spaces, traveling, and dying. His sexual problems and responses to aging are reviewed. The dynamics behind Freud's work and life style are discussed. His success and the subsequent failings of the psychoanalytic movement result from his neurosis and sexual problems.—B. S. Aaronson.

6795. Jung, Carl G. *Symbols of transformation: An analysis of the prelude to a case of schizophrenia*. (Trans. by R. F. C. Hull) New York: Harper (Torchbook), 1962. 2 vols.: xxix, 1-273, \$2.25; ix, 274-557, \$2.25.—A translation of the 4th Swiss edition of *Symbole der Wandlung*. The original version was published in 1912 at the time when Jung broke with Freud. It contains Jung's views on myths and symbols, an anamnesis of the Miller fantasies, and discussions of the libido concept and mother and hero symbols. (31-p. bibliogr.)—T. F. Naumann.

6796. Keiser, S. *Disturbance of ego functions of speech and abstract thinking*. *J. Amer. Psychoanal. Ass.*, 1962, 10(1), 50-73.—Disconnected speech and disturbances in abstract thinking may serve defensive needs and may be rooted in the fantasy of a fused mother-child single body image. There is need to deny separation from mother, to deny the femaleness of the mother, and to deny the nakedness of the over-exhibitionistic psychotic or borderline mother. Failure to incorporate, to introject, and to identify with the mother damages the ego functions of speech and thought processes as they involve abstract thinking.—D. Prager.

6797. Kestenberg, Jean. *A propos de la relation érotomaniaque*. [The erotomanic relationship.] *Rev. Franc. Psychanal.*, 1962, 26(5), 533-604.—This can be defined as a 1-sided love relationship in which the invested person does indeed exist but according to the patient's needs and defense mechanisms. It involves a function of protection through a compromise between narcissistic and objectal libido. The relationship is a move toward repersonalization and reassurance of self-integrity.—G. Rubin-Rabson.

6798. Loch, Wolfgang. *Psychoanalyse und Kausalitätsprinzip*. [Psychoanalysis and causality principle.] *Psyche, Stuttgart*, 1962, 16(7), 401-419.

—Psychoanalysis as a research method is based on the causality principle. But the determination of psychic content is circular and multicausal, not linear and monocausal. Further, causal-genetic reductive determination of behavior, as well as prediction, is limited by the fact that both psychic energy and structure are simultaneously involved in object relations. The micropsychological realm requires Bohr's principle of the complementarity of indeterministic spacetime determinations and statements of deterministic functions.—E. W. Eng.

6799. Loewald, Hans W. (New Haven) *Internalization, separation, mourning, and the super-ego*. *Psychoanal. Quart.*, 1962, 31(4), 483-504.—"The formation of the super-ego . . . is considered in its relation to the phenomena of separation and mourning. Separation is described in its aspect as the occasion for processes of internalization, especially as it is related to mourning. The work of mourning is not confined to a gradual relinquishment of the lost object but also encompasses processes of internalizing elements of the relationship with the object to be relinquished. . . . The concept of degrees of internalization is advanced. This implies shifting distances of internalized 'material' from the ego core and shifting distances within the ego-superego system, as well as transformations in the character of the introjects according to the respective degrees of internalization."—J. Z. Elias.

6800. Neumann, Erich. *Amor and Psyche: The psychic development of the feminine*. A commentary on the tale by Apuleius. (Trans. by Ralph Manheim) New York: Harper & Row (Torchbook), 1962. 181 p. \$1.25 (paper).—The mythological tale of Eros and Psyche from the *Metamorphoses* or *The Golden Ass* of Lucius Apuleius is first presented from the translation of H. E. Butler. Neumann then presents a detailed psychological interpretation of the Latin story according to Jung's basic principles. The initial conflict of Aphrodite and Psyche, the latter's death marriage with Eros, her rejection of him on the advice of her man-hating sisters, the transformation of her love into an active womanhood seeking to be reunited with Eros, her subsequent trials and sacrifices, her overpowering by sleep as a result of her curiosity, and her eventual reawakening by Eros to become his Olympian goddess-wife—these are primordial elements in the development of the feminine and, in fact, of all humanity, and represent "the love mysticism of all times." Further remarks concern the relation of this myth to religious beliefs and practices, to other folk tales, and to probable sources for Apuleius' particular version of this document of feminine psychology.—J. T. Cowles.

6801. Reik, Theodore. *Ritual: Four psychoanalytic studies*. (Trans. by D. Bryan) New York: Grove (Evergreen), 1962. 367 p. \$2.45 (paper).—A paperback edition of a book originally published in 1946, with a preface by Sigmund Freud.

6802. Rola, Edgardo H., & Rolla, Josefina M. de. *Esquema de la percepción de límites*. [Schema of the perception of boundaries.] *Acta psiquiat. psicol. Argent.*, 1962, 8(1), 7-15.—Effective functioning of sensory systems is paralleled by a lessening of anxiety. When a defect of distance perception facilitates projective identification and when distance itself is minimized, the ego supplements defective recognition

by use of proximal receptors of taste, touch, and kinesthetic sense. Basically hexagonal schemata signifying ego-environment interaction in terms of the mediating function of the 6 sensory modalities (including kinesthetic) are employed to depict the following states: prenatal, primary schizophrenia, depressive state, mania, hypomania, neurotic depression, melancholia, autism, social psychopath, acting-out personality, and advanced psychopathic psychosis. This permits conceptualization of personality structure in terms of the permanent interaction of body, mind, and space.—*W. W. Meissner.*

6803. **Schmidl, Fritz.** (Seattle, Wash.) **Psychoanalysis and history.** *Psychoanal. Quart.*, 1962, 31(4), 532-548.—The relationship between the 2 disciplines is examined, and examples are given of psychoanalytic studies of figures in history. It is concluded that "the application of psychoanalysis to problems of history has been casual and often unsatisfactory. The main reason for this is that psychoanalysis requires the cooperation of a living person. . . . Though, basically, this is an insurmountable difficulty, some valuable results could be achieved if workers in the field of history would become familiar with certain typical gestalten known and understood by psychoanalysts for, often, they will find the same gestalten in historical material. In this way they could arrive at an understanding of unconscious motivation in history."—*J. Z. Elias.*

6804. **Tamarin, G. R.** **Die Rolle der personalen und transpersonalen Ich-Definitionen in der Psychopathologie der Identitätsstörungen.** [The role of personal and transpersonal ego definitions in the psychopathology of identity disturbances.] *Confin. psychiat., Basel*, 1962, 5(4), 196-232.—Identity disturbances are expressed by altered self-definitions of the ego and/or pathological redefinition of transpersonal belongingness. Changes in definition of the self occur as: change of one's name, splitting or multiplication of the personality or autoagnosia, delusional redefinition of one's social role, defective ego autonomy, and defective ego integrity. (7 clinical case illustrations).—*E. W. Eng.*

6805. **Wangh, M. (Ed.)** **Fruition of an idea: Fifty years of psychoanalysis in New York.** New York: International Universities Press, 1962. 124 p. \$3.00.—A series of brief articles commemorating the 50th anniversary of the New York Psychoanalytic Society and the 30th anniversary of the New York Psychoanalytic Institute. Contributors include Samuel Atkin, B. D. Lewin, R. M. Loewenstein, V. H. Rosen, Heinz Hartmann, Leo Rangell, L. S. Kubie, J. A. Arlow, and B. E. Moore.—*D. Prager.*

6806. **Wells, Harry Kohlsaat.** **Sigmund Freud: A Pavlovian critique.** New York: International, 1962. 252 p. \$1.65 (paper).—A paper edition of the book originally published in 1961.

6807. **Zilboorg, Gregory.** **Psychoanalysis and religion.** New York: Farrar, Straus & Cudahy, 1962. xi, 243 p. \$4.50.—Edited by Margaret Stone Zilboorg, these writings are taken from previously published work on psychoanalysis, with the exception of 1 previously unpublished chapter. Chapters are: "The Fundamental Conflict with Psychoanalysis," "Psyche, Soul, and Religion," "Psychoanalysis and Religion," "Psychiatric Consideration of the Ascetic Ideal," "Sigmund Freud," "Scientific Psychopathol-

ogy and the Religious Issues," "Love in Freudian Psychoanalysis," "The Sense of Guilt," "Psychiatry's Sphere," and "Freud and Religion."—*G. K. Morlan.*

PHYSIOLOGICAL CORRELATES

6808. **Jenks, R. Stephen, & Deane, George E.** (Coll. Wooster) **Human heart rate responses during experimentally induced anxiety: A follow-up.** *J. exp. Psychol.*, 1963, 65(1), 109-112.—Base-level measurements of cardiac activity were made while Ss watched the sequence of Numbers 1 through 12 appear on a memory drum. Half of the Ss were then told to expect shock and half told to expect an extremely loud tone during Number 8, 9, or 10. Half of the shock Ss received 1 shock and half of the tone Ss received 1 tone. Other Ss received no noxious stimulus. All Ss showed an acceleration in rate during Numbers 1 through 6 and a deceleration during Numbers 8 through 10. The amplitude of the acceleration or deceleration was not dependent upon whether or not the noxious stimulus was received, but the shock-anticipation group showed greater acceleration than the tone group.—*Journal abstract.*

6809. **LeMunyan, Cobert Duane.** (U. Maryland) **The relationship between 17-OH-CS level and rated adjustment of school children.** *Dissert. Abstr.*, 1962, 22(10), 3734.—*Abstract.*

6810. **Malz, S., & Strauss, H.** (Central Hosp., Afula) **Hatismonet shel tekufat hamaabar.** [Menopausal syndrome.] *Dap. refuim*, 1962, 21, 464-488.—500 rural women in the menopause were examined in order to study the physiological and emotional conditions of their life. The average age of menopause was 49 years. The menopause did not limit general physical capacity. No psychological preparation or adequate treatment was found. Only a relatively small number of psychiatric deviations or involuntal psychoses were found to be directly connected with menopause. Mental reaction to the menopause seems to be a matter of personality and individual character. Some physiological observations connected with menopause are included. (English & French summaries).—*H. Ormian.*

THERAPY & GUIDANCE

6811. **Carkhuff, Robert R.** (U. Buffalo) **The MMPI: An outline for general clinical and counseling use.** Buffalo, N. Y.: Author, 1961. 53 p. \$2.00.—A succinct presentation of recent research findings for the 10 MMPI clinical scales plus the 3 validity scales. Data for the 13 scales are organized in outline form under the headings of item content, general scale meaning, clinical interpretations of high and low scores, and educational and vocational findings for both high and low scores. (87 ref.)—*W. L. Barnette, Jr.*

6812. **Group for the Advancement of Psychiatry, Committee on the College Student.** **The college experience: A focus for psychiatric research.** *GAP Rep.*, 1962, No. 52, 713-761.—Past psychiatric research in colleges is reviewed, and areas for further work are delineated. Colleges offer unique opportunities for studying late adolescent personality development, individual emotional illness, the interaction between student and institution, and the nature of educational processes. College psychiatrists' inter-

ests have widened from treatment of troubled individuals to increasing concern with normal student development in the institutional setting. To interdisciplinary research into conditions facilitating full realization of intellectual and personal potential, psychiatrists can contribute valuable clinical data, experience, and theoretical ideas. Practical difficulties in such research are considered. (181-item bibliogr.)—A. E. Wessman.

6813. Hoch, P. H., & Zubin, J. (Eds.) *The future of psychiatry: Proceedings of the 51st Annual Meeting of the American Psychopathological Association*, 1961. New York: Grune & Stratton, 1962. 271 p. \$8.75.—Part I contains 4 articles on the future of the neurophysiologic and neurochemical approaches. Part II contains 4 articles on the future of the psychological, social, and educational approaches. Part III contains 4 articles on the future of conceptual systems. Part IV contains 4 articles on the future of genetic, developmental, and organic approaches.—D. Prager.

MEDICAL THERAPIES

6814. Cantoni, Louis J., & Cantoni, Lucile. (Wayne State U.) *Focusing on the untreatable, emotionally disturbed.* *Med. Times*, 1961, 89(12), 1298-1301.—The role of the family physician in the treatment of patients with psychogenic disorders is discussed. For patients amenable to treatment, the physician can offer reassurance and referral to appropriate agencies. He can also provide sustaining counsel for many who are unable to recognize their chronic disturbance. Examples are given of patients considered not amenable to treatment. The family physician is cautioned to be firm with patients who do not participate in the helping process, or who are actually engaging in destructive behavior.—*Author abstract.*

6815. Newton, Arthur. (Louisiana State U.) *The effects of prefrontal lobotomy on performance of delayed response problems in human psychotic patients.* *Disseri. Abstr.*, 1962, 22(9), 3267-3268.—*Abstract.*

6816. Salesi, Eneas A., & Piedimonte, Rubén C. *El micorén en la electrochoque terapia con barbitúricos.* [Micoren in electroshock therapy with barbiturates.] *Acta psiquiat. psicol. Argent.*, 1962, 8(1), 48-49.—Experience with 322 applications of EST and 102 narcoanalytic sessions is synthesized. Use of micoren with barbiturates has the advantage of less risk, decreased irregularity and apnea, more uniform anesthesia, less sensation of dulling, better recovery of respiratory rhythm, elimination of cyanosis, and more rapid return to consciousness.—W. W. Meissner.

Drug Therapy

6817. Bayliss, S. G., & Gilbertson, Moyna P. (National Hosp. Nervous Disorders, London, England) *Controlled trials of chlorthalidoxepoxide in spastic children.* *Develpm. Med. child Neurol.*, 1962, 4(6), 597-601.—A double-blind cross-over trial on 41 spastic children indicated some improvement in the treated patients, "mainly due to improved sleep and behaviour," but "no significant effect when assessed solely on effect on the motor disability. No

serious side-effects were seen, but emotional upsets and drowsiness were troublesome."—T. E. Newland.

6818. Bobon, J., & Goffioul, F. *L'action antidepressive rapide du G35020, metabolite 3 de l'imipramine (tofranil): Etude pilote de 100 cas.* [The rapid anti-depressive action of G35020, metabolite 3 of imipramine (tofranil): A pilot study of 100 cases.] *Acta neurol. psychiat. Belg.*, 1962, 62(4), 359-373.—Long term patients were treated with G35020 during periods going from 50 to 250 days with mean daily dosage of 100 mg. taken orally. The overall therapeutic results are positive in a high percentage of the patients (76%). The action has been significantly favorable, mainly in psychasthenic patients. The psychotropic effect is potent and appears rapidly within the first 5 days in 47% of the patients. Side effects are minor and similar to those of imipramine (major inconvenience in 10%).—V. Samua.

6819. Delay, Jean, & Deniker, Pierre. *Methodes chimiotherapiques en psychiatrie: Les nouveaux medicaments psychotropes.* [Chemotherapeutic methods in psychiatry: The new psychotropic drugs.] Paris, France: Masson & Cie, 1961. 496 p. NF 65.—This volume constitutes a review of psychopharmacology and of the use of newer drugs in psychiatry and is intended for clinicians or laboratory workers in psychopharmacology. The principal types of drugs, neuroleptics, tranquilizers, and antidepressives are classified and defined according to their properties in the laboratory and in clinical practice. Topics covered include a history of drug therapy in psychiatry; drug classification and characterization of chlorpromazine, rauwolfia, and derivatives; neuroleptics; psychophysiologic characteristics of neuroleptics; tranquilizers; antidepressive chemotherapy; chemotherapeutic methodology in psychiatry; and the influence of chemotherapy upon modern psychiatry.—M. E. Jarvik.

6820. Downing, R. W., & Rickels, K. (U. Pennsylvania School Medicine) *Personality and attitudinal correlates of response to drug treatment in psychiatric outpatients: II. Preliminary investigation and implications for further research.* *J. Psychol.*, 1962, 54(2), 345-361.—In a preliminary study, psychiatric clinic patients were found to be more anxious and less self-accepting than patients of the medical clinic, and there was a trend toward greater compliance in the medical clinic group. This variable appeared to play a different role in patients from the 2 clinics. For psychiatric clinic patients, greater dependency was associated with higher anxiety and with lower self-acceptance, but dependency was not systematically related to our measure of compliance behavior. For medical clinic patients, dependency was not related to self-acceptance, but it was positively related to our measure of compliance behavior. The data would seem to indicate that dependency is directly expressed through compliant behavior when dependency is an acceptable element in one's self-concept, but that their direct expression is not present when one does not accept himself as a dependent individual.—*Author abstract.*

6821. Ey, Henri; Cor-Mordret, M., & Eppe, J.-P. (Hôpital Psychiatrique, Bonneval) *Sur le traitement des psychoses chroniques par la tri-fluopérazine.* [Treatment of chronic psychoses by

trifluoperazine.] *Evolut. psychiat.*, 1962, 27(3), 399-409.—Trifluoperazine, which is trifluoromethyl, was given to 30 chronic psychotics, with 45% good results. Some results are described in case histories. Moreover, the effects are charted in a table in which each patient is grouped under 1 of 6 psychotic states, and the effects are noted in 12 categories. (15-item bibliogr.)—*L. A. Ostlund.*

6822. Fisher, G. W., Murray, F., Walley, M. R., & Kiloh, L. G. (Prudhoe & Monkton Hosp., Northumberland, England) A controlled trial of imipramine in the treatment of nocturnal enuresis in mentally subnormal patients. *Amer. J. ment. Defic.*, 1963, 67(4), 536-538.—Imipramine in the dosage used in this study was ineffective in controlling enuresis in a group of subnormal patients of wide age range.—*V. S. Sexton.*

6823. Lambert, P. A. La thioproperazine: Ses propriétés pharmacodynamiques, sa place parmi les autres neuroleptiques en thérapeutique psychiatrique. [Thiopropazine: Its pharmacodynamic properties, its place among other neuroleptics in psychiatric therapy.] *Acta neurol. psychiat. Belg.*, 1962, 62(5), 441-456.—Thiopropazine was born out of the laboratory research aiming at an original product different from chlorpromazine in at least not having its secondary effects. With the mentally sick, and for the schizophrenic in particular it is incisively active with the weakest doses, but among the most delicate to handle because of neurological intolerances. The rest of the issue is devoted to 10 more articles reporting on the effects of thiopropazine in various mental diseases.—*V. Sanua.*

6824. Oswald, Ian; Berger, Ralph J., Jaramillo, R. A., Keddie, K. M. G., Olley, P. C., & Plunkett, G. G. (U. Edinburgh, Scotland) Melancholia and barbiturates: A controlled EEG, body and eye movement study of sleep. *Brit. J. Psychiat.*, 1963, 109(Whole No. 458), 66-78.—6 patients were compared with 6 controls, with patients showing more wakefulness. Heptabarbital was effective in reduction in paradoxical sleep—a reduction of dreaming.—*W. L. Wilkins.*

6825. Rickels, K., & Downing, R. W. (U. Pennsylvania School Medicine) Personality and attitudinal correlates of response to drug treatment in psychiatric out-patients: I. Theoretical orientation and measuring instruments to be employed. *J. Psychol.*, 1962, 54(2), 331-344.—The personality variables of anxiety, compliance, dependency, manifest hostility, and attitude toward the doctor and parental figures are important factors to be considered in the understanding of such treatment responses as dropping out, side reactions, and placebo effects in the out-patient drug therapy situation. A battery of tests to be used in measuring these factors as well as the rationale for selecting them, is described.—*Author abstract.*

6826. Rosa, Jorge J., Villanueva, Juan R. M., & Campioni, Edmundo L. Un nuevo neuropléjico no fenotiazínico: Su aplicación en el alcoholismo subagudo. 2-cloro, 9-dimetilamino-propiliden)-tio-xanteno. [A new non-phenothiazene neuroplexic agent: Application in subacute alcoholism. 2-chloro, 9-(dimethylamino-propylidene)-thioxanthene.] *Acta psiquiat. psicol. Argent.*, 1962, 8(1), 46-47.—Results

of treatment of 14 chronic cases are reported (age range 30-60 yr., duration of alcoholic habit 12-23 yr.). Dosage of 100-200 mg/day excluded agitation after 16 hr., and showed favorable effects on perceptual disturbances within 48 hr.—*W. W. Meissner.*

6827. Spencer, A. M. (Powick Hosp., Worcester, England) Permissive group therapy with lysergic acid diethylamide. *Brit. J. Psychiat.*, 1963, 109(Whole No. 458) 37-45.—10 female patients of poor prognosis met in group twice weekly for 16 months with a 9-5 LSD group session. Tailor's dummies, dressed, were used as bad parental surrogates in the meetings so doctor, nurse, and patients could act as good parental and sibling surrogates. Aggression toward the paternal dummy is described. 3 patients were considerably helped and 4 somewhat improved.—*W. L. Wilkins.*

Shock Therapy

6828. Özaydin, S. (U. Istanbul) La cause du coma au cours du choc insulinique: Etude basée sur les modifications du volume des liquides extracellulaires. [The cause of coma in the course of insulin shock: A study based on modifications of the volume of extracellular fluids.] *Encephale*, 1962, 51(4), 383-394.—Measures taken on 12 Ss indicate that coma or disturbances of consciousness during insulin shock treatment are due to intracellular hypoglycemia together with the flow of liquid to the extracellular spaces. This latter phenomenon is probably caused by the increase of albumin in the interstitial tissues. Certain substances, like adrenaline, intensify the infiltration of albumin during insulin shock. (42 ref.)—*W. W. Meissner.*

6829. Yvonneau, Michel. (Hôpital Psychiatrique, Bonneval) Placebo et electrochoc. [Placebo and electroshock.] *Evolut. psychiat.*, 1962, 27(3), 393-397.—The variety and methodology of placebos is enumerated briefly. However, pseudo-electroshock treatment is the main subject. The author reports a background of such studies. His own research consisted of telling patients ready to be given narcotics (nesdonal-atropine) that they would get an electric shock. Though no shock was given, the patients submitted to a mean of 3.25 pseudo-electroshock sessions. Out of 17 psychotics, there were 13 failures, 3 were helped, and 1 was cured. Out of 11 neurotics, there were 2 failures, 3 were helped, and 6 were cured. The author attributes the results to a parallelism between biopsychological mechanisms during electroshock and pseudo-electroshock.—*L. A. Ostlund.*

PSYCHOTHERAPY

6830. Aarons, Z. Alexander. (Walnut Creek, Calif.) Indications for analysis and problems of analyzability. *Psychoanal. Quart.*, 1962, 31(4), 514-531.—Estimation of the problems to be met with in an analysis and prediction as to the analyzability of the patient are discussed. "Although it is desirable to predetermine, and with some degree of probability, that the patient is analyzable, this may not be feasible in many instances."—*J. Z. Elias.*

6831. Atkinson, Stuart Emory. (U. Colorado) Social class, interpersonal role orientations, and conceptions regarding psychotherapy. *Dissert. Abstr.*, 1962, 22(9), 3264.—*Abstract.*

6832. Buhler, Charlotte. *Values in psychotherapy*. New York: Free Press Glencoe, 1962. xv, 251 p. \$5.25.—"Values permeate our development and personality to such a degree that they can never be left out of the picture." The book considers 2 problems: (a) "whether, why, and how the psychotherapist has to get involved with the value problems of his patients" and (b) "how the therapist's and the patient's self-development and self-understanding and the role that values play for them in human life must by necessity affect the process of therapy. . . . The basic theme of the book is a discussion of psychotherapy as value-discrimination, either by reduction of generalization or by 'new' seeing."—C. H. Miley.

6833. Cartwright, Desmond S., Kirtner, William L., & Fiske, Donald W. (U. Colorado) *Method factors in changes associated with psychotherapy*. *J. abnorm. soc. Psychol.*, 1963, 66(2), 164-175.—This study investigated the factorial structure of changes concomitant with client-centered therapy. Most of the variables were differences obtained by subtracting the pretherapy scores from the corresponding post-therapy scores of each of 93 clients. The 1st 4 factors seem to reflect: change in favorableness of client self-evaluation, change in adequacy ratings based on the TAT, therapist's perception of change, and change on Hs and Hy from the MMPI. The 5th factor was length of therapy. Of these orthogonal factors, the 1st 4 are seen as method factors, each being associated primarily with an observer-instrument combination. As measured, the changes associated with short psychotherapy cannot be adequately represented by a single global rating or by scores for personality traits defined either broadly or narrowly. (23 ref.)—*Journal abstract*.

6834. Dreyfus, Edward A. (U. Kansas) *Counseling and existentialism*. *J. counsel. Psychol.*, 1962, 9(2), 128-132.—A theoretical discussion of the similarities between existential psychotherapy and the client-centered or nondirective school, the view of man as a "continuously emerging being."—E. R. Oetting.

6835. Duffy, Vernon. *From beside the couch*. New York: Vantage, 1962. 44 p. \$2.00.—Written under a pseudonym, this is a collection of humorous statements made by patients in psychotherapy.—C. T. Morgan.

6836. Ekstein, Rudolf. *Special training problems in psychotherapeutic work with psychotic and borderline children*. *Amer. J. Orthopsychiat.*, 1962, 32(4), 569-583.—The 2 main differences between child psychotherapists and therapists who work with adults are: (a) the motivating forces which make for the choice, and (b) the specific problems in dealing with the child-parent unit. Special training problems in supervising child psychotherapists and especially those dealing with borderline or schizophrenic children have to do with rescue fantasies, countertransference potentials, and parent-hating syndromes. In the discussion, Lester Luborsky emphasizes the fact that motives contained in the therapist's counter-transference may be the very motives which sustain him through the treatment.—R. E. Perl.

6837. Enke, Helmut. (U. Freiburg, Breisgau, Germany) *Die Bedeutung des Körpersymptoms in der klinischen Psychotherapie*. [The significance of bodily symptoms in clinical psychotherapy.] *Prax. Psychother.*, 1962, 7(6), 263-267.—The author dis-

tinguishes between 3 types of mental patients with regard to the presence of physiological symptoms. He states that his patients have an average of 4 psychosomatic symptoms, including a "Leit-Symptom," or "leading symptom." A statistical survey of the symptoms of 273 patients is included. "Symptom confrontation," or confronting the patient with his physiological symptomatology, and the effect of the interpretation of symptoms to patients is discussed briefly.—W. Swartley.

6838. Frankl, V. E. *Die Heimholung der Psychotherapie in die Medizin*. [Bringing psychotherapy back to medicine.] *Acta psychother. psychosom.*, Basel, 1962, 10(2), 99-110.—The doctor, not the technique is important. By its manner of administration, psychotherapy can be dehumanizing, more so than pharmacotherapy or shock treatment. A new neurosis has come into being—a pointlessness to life, an existential vacuum—requiring a new therapy. Psychotherapy must return to medicine, and its return will change both. For psychotherapy, demythologization will prove beneficial; for medicine, re-humanization.—G. Rubin-Rabson.

6839. Holzman, Mathilda Sara. (U. Washington) *The significance of the value systems of patient and therapist for the outcome of psychotherapy*. *Dissert. Abstr.*, 1962, 22(11), 4073.—*Abstract*.

6840. Komor, Peter Paul. (Cornell U.) *A follow up study of "treated" and "untreated" children, from one to four years after termination of psychiatric clinic contact*. *Dissert. Abstr.*, 1962, 22(8), 2876.—*Abstract*.

6841. Meyer, V., & Gelder, M. G. (Maudsley Hosp., London, England) *Behaviour therapy and phobic disorders*. *Brit. J. Psychiat.*, 1963, 109 (Whole No. 458) 19-28.—5 cases of agoraphobia treated by the Wolpe techniques, averaging 80 therapy hours each, had varied success. 2 cases had abatement of symptoms, but 1 became somewhat worse.—W. L. Wilkins.

6842. Parker, Beulah. (U. California) *My language is me: Psychotherapy with a disturbed adolescent*. New York: Basic Books, 1962. viii, 391 p. \$8.50.—This is a conversational record of a therapeutic relationship between a Freudian oriented female psychiatrist and a preschizophrenic youth who was treated as an outpatient for 6½ years. The case material was reconstructed verbatim after each interview. Throughout, the dialogue is interspersed with the therapist's orientation and technique, as well as her feelings. These 230 hours of therapy illustrate the problem of achieving communication with a patient whose idiosyncratic language functions both for defense and for communication. Sequentially, the youth's autistic language provided contact, communication, understanding, and—eventually—change of behavior. The author's maxim is: "If you understand and appreciate my language, you must understand and appreciate me. My language is me."—L. A. Ostlund.

6843. Schachter, Frances F., Meyer, Lucile R., & Loomis, Earl A. *Childhood schizophrenia and mental retardation: Differential diagnosis before and after one year of psychotherapy*. *Amer. J. Orthopsychiat.*, 1962, 32(4), 584-595.—12 schizophrenic, 6 retarded, and 11 normal preschool boys all living at home with intact families were evaluated be-

fore and after a year of therapy (the normals did not receive therapy but were enrolled in a nursery school). Evaluation techniques comprise measures of behaviors in standardized play situations and psychological tests. After a year of psychotherapy the schizophrenic retarded groups improved; the retardates improved even more than the schizophrenics. In the discussion Hyman Spotnitz stresses the importance of attempting psychotherapy with mentally retarded children and suggests that mental retardation in childhood may turn out to be no more a therapeutic impasse than childhood schizophrenia.—*R. E. Perl.*

6844. Shapiro, Stewart B. (Western Psychological Cent., Sherman Oaks, Calif.) **Patient wisdom: An anthology of creative insights in psychotherapy.** *J. Psychol.*, 1962, 54(2), 285-291.—To explore the impact of "patient wisdom" on the therapist, it is first necessary to listen openly without analyzing, categorizing, or reconstructing. 21 "wise" statements were quoted from 10 patients of the writer. The meaning of wisdom, commonalities in the statements, and the essentials of therapeutic change were discussed. Wisdom involves a creative integration of values, nondefensive ego functions and mental soundness. Although highly personal and emotional, the quoted statements retain a kind of universality. One essential to therapeutic change is therapist receptivity to "patient wisdom."—*Author abstract.*

6845. Townsend, Alan H. (U. Michigan) **An empirical measure of ambiguity in the context of psychotherapy.** *Pap. Mich. Acad. Sci. Arts Lett.*, 1956, 41, 349-355.—5 male and 5 female undergraduate college students examined typescripts of sections of therapy interviews after being told that "the experimenter was interested in finding out how well one person could judge the behavior of another. . . . An attempt was made (1) to arrive at an empirical measure of ambiguity in the context of psychotherapy, and (2) to validate a previously established rating method of measurement of the variable. Two measures were employed, one using a series of nine questions and the other a forty-four-item Q-sort. The results show that direct measurement of the variable is possible and also suggest that the alternative method of measurement is valid."—*S. J. Lachman.*

6846. Watts, Alan W. **Psychotherapy East and West.** New York: New American Library, 1963. x, 160 p. \$.60 (paper).—A paperback edition of a book originally published in 1961.—*C. T. Morgan.*

Therapeutic Process

6847. Grooms, Robert Roy. (Pennsylvania State U.) **Extinction of generalized responses as a method of producing response decrement to the original stimulus: An experimental analogue of psychotherapy.** *Dissert. Abstr.*, 1962, 22(11), 4095.—*Abstract.*

6848. Hobbs, Nicholas. (George Peabody Coll.) **Sources of gain in psychotherapy.** *Amer. Psychologist*, 1962, 17(10), 741-747.—Insight is not a cause of change but a possible result of change. "It is not a source of therapeutic gain but one among a number of possible consequences of gain." 5 "major sources of gain, five kinds of experiences that are the well-springs of personality reorganization" are specified. Psychotherapy is a unique life situation designed to

maximize these sources of gain: (a) a sustaining experience of intimacy with another human without getting hurt; (b) divesting verbal and other symbols of their anxiety producing potential; (c) the transference relationship; (d) client opportunities to practice decision making, to learn to be responsible for himself, to develop an improved self-concept; and (e) insight which facilitates repression and symptom elimination, and involves cognitive structure modifications.—*S. J. Lachman.*

6849. Kaiser, Hellmuth. **Emergency: Seven dialogues reflecting the essence of psychotherapy in an extreme adventure.** *Psychiatry*, 1962, 25(2), 97-118.—Views of psychotherapy expressed through the use of dramatic scenes in the case of suicidal risk in a psychiatric colleague.—*H. M. Cohen.*

6850. Luquet, C.-J. **Réflexions sur le transfert homosexuel dans le cas particulier d'un homme analysé par une femme.** [Homosexual transference in the case of a man analyzed by a woman.] *Rev. Franc. Psychanal.* 1962, 26(5), 501-532.—The fact the analyst is female does not change the essential processes of the analysis, specifically, transference. How well transference is utilized, or how easily it is accomplished depends on the neurotic structure of the patient and the relative importance of the pathogenic imago. It is rather the countertransference which can hamper the evolution of cure because of the disturbance of variation and rhythm in transference chronology.—*G. Rubin-Rabson.*

6851. Munzer, Jean. (Columbia U.) **The effect of analytic therapy groups of the experimental introduction of special "warm-up" procedures during the first five sessions.** *Dissert. Abstr.*, 1962, 22(8), 2896-2897.—*Abstract.*

6852. Nelson, Marie Coleman. **Effect of paradigmatic techniques on the psychic economy of borderline patients.** *Psychiatry*, 1962, 25(2), 119-134.—A transcribed session illustrating paradigmatic psychotherapy and its effect on the borderline case. Theoretical background is presented and the advantage of this type of treatment emphasized.—*H. M. Cohen.*

Group Therapy

6853. Ernst, F. H. **Use of transactional analysis in prison therapy groups.** *Correct. Psychiat. J. soc. Ther.*, 1962, 8(3), 120-132.—A method of studying group therapy behavior in terms of stimulus-response phenomena. The behavior of each inmate-patient is handled by the therapist and the group as a response to a stimulus. There was improved attendance after the transactional analysis method was introduced.—*L. R. Witt.*

6854. Heigl, Franz. (Göttingen, Germany) **Ein prognostisch entscheidender Charakterzug bei verwahrlosten jugendlichen.** [A prognostically decisive character trait in neglected youth.] *Prax. Kinderpsychol. Kinderpsychiat.*, 1962, 11(6), 197-201.—In analytic group therapy the understanding and handling of the characteristic wish for revenge in neurotic wayward youth was found very important.—*E. Katz.*

6855. Wilson, Edouard L. (Federation Handicapped, NYC) **Group therapy experience with eight physically disabled homebound students in**

a prevocational project. *Except. Children*, 1962, 29 (4), 164-169.—"... the results gained show that group psychotherapy can be used as a valuable therapeutic tool in assisting high school homebound physically disabled boys and girls to face up to themselves and the world of work."—J. Z. Elias.

Special Therapies

6856. Daly, Dennis Charles. (St. Louis U.) *Psychodrama as a core technique in milieu therapy. Dissert. Abstr.*, 1962, 22(9), 3266.—*Abstract.*

6857. Eysenck, H. J. (U. London, England) *Behaviour therapy, extinction and relapse in neurosis. Brit. J. Psychiat.*, 1963, 109 (Whole No. 458) 12-18.—Neurotic disorders of a dysthymic sort should be distinguished from those where the patient's behavior is of a socially disapproved nature. For the 1st, extinction operates well and can be helped by reinforcement approaches; for the 2nd type of patient, relapse could be predicted when such approaches are used. Partial reinforcement, with aversion therapy, seems indicated for the 2nd variety of neurosis.—W. L. Wilkins.

6858. Gálfi, Béla. *A munkaterápia a pomázi munkaterápiás intézetben.* [Labor therapy in the Institute for Labor Therapy at Pomáz.] *Magyar pszichol. Szle.*, 1961, 18(2), 173-183.—A new program serving the rehabilitation of mentally sick patients is described. Within the overall framework of milieu therapy, labor therapy plays a very important role in reconstructing the disturbed dynamic stereotype. In a well structured work situation, mostly farming, patients receive an intensive experience of social interaction and integration, as well as monetary compensation for performed productive work.—E. Friedman.

6859. Garland, James A., Kolodny, Ralph L., & Waldfogel, Samuel. *Social group work as adjunctive treatment for the emotionally disturbed adolescent: The experience of a specialized group work department. Amer. J. Orthopsychiat.*, 1962, 32(4), 691-706.—2 cases are presented to illustrate the way in which social group work can be used effectively in conjunction with individual psychotherapy of disturbed adolescents in cases of severe character problems, including acting out, withdrawal, isolation because of physical handicap, and tenuous reality testing.—R. E. Perl.

6860. Horányi, Béla. *A gyógyító hallgatásról.* [Healing silence.] *Magyar pszichol. Szle.*, 1961, 18 (2), 153-156.—Most psychotherapies are based on the theory that once a feeling is created in an individual in connection with a life experience, this feeling never loses its potency in the shaping of the individual's actions and attitude toward the world in general and individuals in particular. Through speaking (psychotherapy), the disturbing and already submerged affect-conflicts could be brought to the surface and eliminated. It is felt that there is no need for this due to the fact that emotions are subject to inactivity atrophy in the same degree as any other function of the nervous system. To eliminate conflicts one needs to further the process of atrophication. This can be achieved by the "never-speak-about-it" method. The patient trains himself through a technique described by author, not even to think about his problems.—E. Friedman.

6861. Široký, H. (Psychiatrická léčebna, Opava, Czechoslovakia) *Diagnostické aspekty psychodramatu.* [Diagnostic aspects of psychodrama.] *Českoslov. Psychol.*, 1962, 6(2), 154-165.—A brief history of psychodrama and its use in Czechoslovakia. Diagnostic possibilities are demonstrated from the author's own material. Reconstruction of life situations and analysis of patient's behavior extends the diagnostic methods and is useful for clinical practice. (English & Russian summaries, 73 ref.)—V. Břicháček.

HYPNOSIS

6862. Abraham Henry H. L. *The suggestible personality: A psychological investigation of susceptibility to persuasion. Acta psychol., Amsterdam*, 1962, 20(2), 167-184.—To determine the relation between sensory and verbal susceptibility to suggestion and which tests might predict susceptibility to different types of persuasive communications, 101 students, age 17 to 42 years, were administered the Edwards Personal Preference Schedule, a heat test, an odor test, and a persuasibility test. From the findings emerges a syndrome of suggestible and non-suggestible personality. Persuasibility is not an isolated but a general trait, contributing to consistent individual differences in susceptibility to suggestion in diverse sensory and verbal areas of influence. Strength, specific nature of stimuli, setting, media of communication, cultural, and social factors remain to be investigated.—G. Rubin-Rabson.

6863. As, Arvid. (U. Oslo, Norway) *Hypnotizability as a function of nonhypnotic experiences. J. abnorm. soc. Psychol.*, 66(2), 142-150.—The relationship between various subjective experiences and susceptibility to hypnosis was studied in 2 samples of female college students, totalling 102. The subjective experiences were registered by the Experience Inventory, a questionnaire developed earlier for this purpose. Hypnotizability was determined by administering objective hypnotic scales individually. Correlations between hypnotizability and the total Experience Inventory score as well as a composite score of selected items were significant in both samples, but the latter failed in predicting hypnotizability better than the total score. Items of subjective experiences significantly related to hypnotizability in the total sample were analyzed in terms of the personality dimensions implied. (17 ref.)—*Journal abstract.*

6864. Barber, Theodore Xenophon, & Calverly, David Smith. (State Hosp., Medfield, Mass.) *"Hypnotic behavior" as a function of task motivation. J. Psychol.*, 1962, 54(2), 363-389.—4 experiments are presented assessing response to test-suggestions in a hypnotic group and in one or more control groups under varying levels of induced motivation. A conventional trance induction procedure was no more effective than brief instructions designed to produce personal involvement in a test-of-imagination situation in (a) facilitating response to suggestions of amnesia, "posthypnotic-like" behavior, body immobility, sensory hallucination, etc., and in (b) eliciting subjective reports that the suggested effects were experienced. The results suggest that many "hypnotic-like" phenomena can be elicited without the administration of a procedure traditionally termed a "trance induction" provided that Ss are motivated to perform well on the criterion tasks and disbeliefs con-

cerning the possibility of experiencing the phenomena have been minimized.—*Author Abstract.*

6865. Gibson, H. B. (U. London) **Furneaux's discussion of extraversion and neuroticism with regard to suggestibility: A criticism.** *Int. J. clin. exp. Hypn.*, 1962, 10(4), 281-287.—Hypotheses suggested by Furneaux (see 36: 41195F) are criticized on the grounds that his basic assumption that extraverts attend more closely in the interpersonal situation is unwarranted. It is maintained on the contrary that introverts are the less distractible and it is shown that the data published earlier by Furneaux and Gibson (see 36: 31167F) accord with a theoretical model derived from Spence. The results are also discussed in terms of an alternative interpretation. It is further contended that Furneaux's treatment of the data leads to other inconsistencies.—*C. S. Moss.*

6866. **Group for the Advancement of Psychiatry. Medical uses of hypnosis.** *GAP Symp.*, 1962, No. 8, 641-708.—Brief papers by M. Ralph Kaufman and Lewis R. Wolberg summarize the historical background and classical clinical uses of hypnosis. Harold Rosen discusses and illustrates technical modifications in trance induction and treatment techniques necessitated by various diagnostic and therapeutic considerations. Martin T. Orne discusses the problems of research in hypnosis, particularly the implicit demand characteristics of experiments; and from his research on the simulation of hypnosis he concludes that beside usual emphasis on increased motivation, role playing, and altered behavior, particular attention should be given to subjective experience, altered consciousness, and logical incongruities in the trance. The appendices contain official policy statements of the American Medical Association and American Psychiatric Association on the medical use of hypnosis and recommendations for adequate training programs.—*A. E. Wessman.*

6867. Hallaji, Ja'Far. **Hypnotherapeutic techniques in a central Asian community.** *Int. J. clin. exp. Hypn.*, 1962, 10(4), 271-274.—The semimonastic Sufi practitioners of Afganistan treat physical as well as psychosomatic disorders by a method which is reminiscent of Mesmerism, and they claim cures even for illnesses such as tuberculosis and cancer. A treatment session for 18 patients is described.—*C. S. Moss.*

6868. Raginsky, Bernard B. (376 Redfern Ave., Montreal 6, Quebec, Canada) **Sensory hypnoplasty with case illustrations.** *Int. J. clin. exp. Hypn.*, 1962, 10(4), 205-219.—Sensory hypnoplasty is a technique in hypnoanalysis in which the hypnotized patient models clay to which various sensory stimuli (e.g., temperature, texture, color, smell) have been added to stimulate basic primitive memories, associations, sensations, and conflicts. This allows the patient to give plastic expression to repressed and suppressed material which is then followed by verbalization of the conflicts. The therapeutic process is reputed to be greatly accelerated. This technique has been used in the successful treatment of diverse pathological conditions.—*C. S. Moss.*

6869. Reyher, Joseph. (Michigan State U.) **A paradigm for determining the clinical relevance of hypnotically induced psychopathology.** *Psychol. Bull.*, 1962, 59(4), 344-352.—4 principles, or criteria, are suggested for the hypnotic induction of psycho-

pathology: the induced process must not include cues as to how E expects the S to respond in any other respect; (b) the induced process must be response-producing, (c) some of the produced responses must fit the criteria for inclusion in some classification of psychopathology; and (c) some of the Ss must be asked by a co-experimenter, unknown to the E, to fake hypnosis in order to determine the demand characteristics of the research.—*W. J. Meyer.*

6870. Rose, J. T. (St. James' Hosp., Leeds, England) **The use of relevant life experiences as the basis for suggestive therapy.** *Int. J. clin. exp. Hypn.*, 1962, 10(4), 221-229.—A brief, directive method of hypnotherapy is described which combines limited insight therapy with hypnotic suggestions based on relevant life experiences of the patient. By integrating suggestions and experiences familiar to the patient, the former are more likely to have greater meaning to the patient and are therefore more effective.—*C. S. Moss.*

6871. Rosenhan, David, & London, Perry. (Educational Testing Service, Princeton) **Hypnosis in the unhypnotizable: A study in rote learning.** *J. exp. Psychol.*, 1963, 65(1), 30-34.—This study was concerned with the effects of hypnosis on the memorization of nonsense syllables. 32 undergraduates, 16 relatively susceptible and 16 relatively unsuspceptible, were individually presented 10 nonsense syllables on a memory drum under counterbalanced hypnotized and un hypnotized conditions. Findings demonstrated that hypnosis facilitates the performance of the relatively unsuspceptible Ss, and impairs the performance of the very susceptible ones. Hypnosis was thus seen as having potentially variable effects which interact with susceptibility and with the specific experimental measure which is used.—*Journal abstract.*

6872. Stachowiak, James Gregory. (U. Kansas) **Hypnosis, the principle of congruity, and attitude change.** *Dissert. Abstr.*, 1962, 22(11), 4107.—*Abstract.*

6873. Sutcliffe, J. P., & Jones, Jean. (U. Sydney, Australia) **Personal identity, multiple personality, and hypnosis.** *Int. J. clin. exp. Hypn.*, 1962, 10(4), 231-269.—The concept of multiple personality is critically examined in the light of its historical development. Various conceptions of multiple personality are considered: as a diagnostic fashion, as a product of shaping in therapy, as a product of hypnotic suggestion, as simulation, and as an extension of characteristics found in "normal" personalities. These considerations lead to the conclusion that the significant alterations of personality characterizing the syndromes are loss of self-reference memories, and confusions and delusions about particular identity in time and place. The parallels in multiple personality and hypnotic phenomena lead to the heuristic hypothesis that degrees of proneness to multiple personality are predictive of degrees of hypnotizability. (76 item bibliogr.)—*C. S. Moss.*

6874. Webb, Robert A. (Alabama State Hosp., Tuscaloosa) **Suggestibility and verbal conditioning.** *Int. J. clin. exp. Hypn.*, 1962, 10(4), 275-279.—Evidence is advanced that postural sway suggestibility is positively correlated with verbal conditioning. No S below 100 mm. of body sway showed any indication of conditioning. The lowest suggestibility group appeared to be counter-conditioning.—*C. S. Moss.*

DREAMS

6875. Bernstein, Isidor. Dreams and masturbation in an adolescent boy. *J. Amer. Psychoanal. Ass.*, 1962, 10(2), 289-302.—Clues regarding the form of masturbation and the content of masturbation fantasies were obtained from dreams. This assisted in analysis of method of control and discharge of tension in this boy. The element of motion, specifically riding, in the manifest dream content refers to masturbation. Such riding dreams are included in a group of typical dreams incompletely described by Freud.—D. Prager.

6876. Diamond, Edwin. The science of dreams. Garden City, N. Y.: Doubleday, 1962. 264 p. \$4.50.—This book includes discussions on the human use of dreams to maintain sanity, the influence of suggestions on future dreams, the relationship of sexuality and dreams, the role of dreaming in primitive societies, the topics of the dreams of both normals and schizophrenics, physiological correlates of sleep and dreaming, and the effects of sensory and sleep deprivation.—J. B. Thompson.

6877. Dittborn, Julio M. (U. Chile) Experimental recollection of dreams. *J. Psychol.*, 1963, 55(1), 39-41.—Reports of experiments where the author played the phrase "to awake while dreaming" during his sleep. This sentence was transmitted from a tape recorder specially adapted with a closed loop which permitted the phrase to be continuously played 6-7 times per minute. A meaningless phrase was played as control on some nights. S awoke on all experimental nights no matter which phrase was played. However, dreams were remembered only on those nights on which the meaningful phrase was played. Other facts observed were the following: a) after awakening on 2 different nights when the meaningful phrase was played, the text of it was heard completely distorted; and (b) the dreamer executed in a dream the task which he was to perform during the awakening on an experimental night.—Author abstract.

6878. Fodor, Nandor. New approaches to dream interpretation. New York: Citadel, 1962. xvi, 368 p. \$1.95 (paper).—A paperback edition of a book originally published in 1951.—C. T. Morgan.

6879. Fromm, Erika, & French, Thomas M. (U. Chicago) Formation and evaluation of hypotheses in dream interpretation. *J. Psychol.*, 1962, 54(2), 271-283.—Dream interpretation is conceived of in this paper as an artistic as well as a scientific process. The interpreter forms intuitive hypotheses about the meaning of a dream either through a fully illuminating flash about the dream as a whole or through a gradual chain-reaction understanding of separate clues. In either case he must subject his hypotheses to an honest, rigorous, and detailed critical evaluation in order to be sure that he faithfully and sensitively translates into secondary process thinking the total gestalt of the patient's unconscious wish, fear, and dream thoughts. The processes of arriving at hypotheses in the interpretation of individual dreams, different methods of approaching a dream, causes for failure in dream interpretation, and indicators for the correctness of the interpretative hypothesis are outlined. Examples are given.—Author abstract.

6880. Furman, E. Some features of the dream function of a severely disturbed young child. *J. Amer. Psychoanal. Ass.*, 1962, 10(2), 258-270.—When the waking ego relaxed its defenses, the child remembered more of his dreaming. The study of the boy's dreams revealed that his ego was capable of functioning on a much less primitive level than one would assume from his waking defensive symptoms. When the drive content of dreams became too threatening the ego detached both the content and the whole function of dreaming. This defense derived from his early relationship with his mother.—D. Prager.

6881. Harley, M. The role of the dream in the analysis of a latency child. *J. Amer. Psychoanal. Ass.*, 1962, 10(2), 271-288.—The dream provided a safety valve for discharge of excessive excitations and a means to substitute reflective thought for impulsive action. As the ego gained increasing relief from her drive urgencies, the dream material gradually faded from the analysis and reappeared with her renewed tensions at prepuberty. Dreams play a dominant role in a minority of latency children in analysis.—D. Prager.

6882. Root, N. N. Some remarks on anxiety: Dreams in latency and adolescence. *J. Amer. Psychoanal. Ass.*, 1962, 10(2), 303-322.—Latency children are more unwilling than adolescent children to bring anxiety dreams into analysis. The anxiety dream is an attempt to achieve orgasmic discharge which fails. These children seem to become addicted to anxiety excitement. The anxiety dream may also be viewed as a sadomasochistic discharge like a temper tantrum. Anxiety inhibits full discharge which is hungered for but fantasied as total destruction. Being overwhelmed by anxiety in the dreaming or waking state represents failure of mastery over the excessively stimulated sexual and aggressive drives.—D. Prager.

CASE HISTORIES

6883. Field, P. B., Maldonado-Sierra, E. D., Wallace, S. E., Bodarky, C. J., & Coelho, G. V. (Puerto Rico Inst. Psychiatry) An other-directed fantasy in a Puerto Rican. *J. soc. Psychol.*, 1962, 58(1), 43-60.—A TAT story in which the hero decided to adjust himself to the peer group's wishes is the starting point of a culturally-oriented case study of Puerto Rican college student. This student's unsatisfying formal, hierarchical, and impersonal family relationships lead him to seek instead the informal, personal, loosely-organized relationships of a peer group. He tries to achieve success through dependency, conformity, obedience, and conciliation rather than through independent self-assertion.—Author abstract.

6884. Fraiberg, S. Technical aspects of the analysis of a child with a severe behavior disorder. *J. Amer. Psychoanal. Ass.*, 1962, 10(2), 338-367.—The analysis showed how the aggressive and destructive behavior was used defensively. The ego spared itself anxiety thru identification with the aggressor and thru a shift from passive to active. Connections between masturbation fantasies and impulsive acting out provided insights into the defensive role of isolation of affects. The most important part of the analytic work was that which dealt with defenses against affects.—D. Prager.

6885. Sachs, L. J. A case of castration anxiety beginning at eighteen months. *J. Amer. Psychoanal. Ass.*, 1962, 10(2), 329-337.—"What is noteworthy about the case reported here is not only that an oedipal conflict appears to produce castration anxiety at eighteen months, but that there are, in addition, defenses already created against the anxiety."—D. Prager.

PSYCHIATRIC SERVICES

6886. Berkowitz, Norman M., Malone, Mary F., & Klein, Malcolm W. (Human Relations Cent., Boston U.) Patient care as a criterion problem. *J. Hlth. hum. Behav.*, 1962, 3(3), 171-176.—3 independent estimates of the quality of patient care in outpatient departments were collected: (a) difficulty of illness for patient, (b) size of clinic, and (c) medical manageability of illness. Physicians in 53 clinics were questioned, 24 administrators were interviewed, observations of nurse-patient teaching interactions were obtained for 62 nurses, and follow-up data on 3800 patients were collected. Of the many findings, the following are clearest: there is a negative relationship between difficulty of illness for the patient and the amount of follow-up. Clinics dealing with illnesses of high difficulty for the patient have lower levels of patient compliance. However, each aspect of patient care was differentially sensitive to the nature of the clinics.—L. A. Ostlund.

6887. Goodrich, Wells, & Ifund, Boris. (National Inst. Mental Health) Staff perceptions and reality in clinical behavior reporting. *Hum. Relat.*, 1962, 15(4), 351-363.—Behavior reports of child-care workers were evaluated and ranked by the psychiatric and child-care staffs for frequency of desired appearance and impression of appearance in reports. The respective staffs showed significant agreement on the 17 categories. Significant correlations between staff rankings were found in regard to the ideal note, and between the ideal note of the psychiatric staff and the actual note of the child-care staff. The discrepancy between what the psychiatric staff wanted and what it thought was there was larger than the real discrepancy. Causes of displaced dissatisfaction were discussed.—W. W. Meissner.

6888. Hárđi, Istvan. Megfigyelesek az ápolás pszichológiájáról. [Observations concerning the psychology of nursing.] *Magyar Pszichol. Szle.*, 1961, 18(1), 53-60.—The importance of the psychological effects of good nursing care is stressed. In hospitals, where the doctor-nurse-patient relationship is disturbed this can hinder the otherwise perfect physiological treatments. The relationship of the nurse and patient depends greatly upon the personality and attitude of the nurse. The mechanical, the neurotic, and the play-acting nurse are described and their effect on the patients assessed. The most important area of patient-nurse relationship is the technique and style of ward management and the mutual relationship among the ward personnel. Introspection, and the observation of the psychological influence of the nurse's behavior on the patient could help a great deal to correct prevailing faulty and harmful interactions.—E. Friedman.

6889. Rushing, William A. (Florida State U.) Social influence and the social-psychological function of deference: A study of psychiatric nursing.

Soc. Forces, 1962, 41(2), 142-148.—Interviews with 16 psychiatric nurses reveal the use of deferential actions in the attempt to influence the decisions of, as well as to maintain a relationship with, the physicians with whom they work. Discussion centers around these actions, termed "power strategies," which are seen both as actions oriented to a normative order but not in conformity with that order and as reactions to a power order.—A. R. Howard.

Institutional Care

6890. Bloom, Samuel W., Boyd, Ina, & Kaplan, Howard B. (Baylor U. Coll. Medicine) Emotional illness and interaction process: A study of patient groups. *Soc. Forces*, 1962, 41(2), 135-141.—The focus is on the mental hospital as an institution of socialization. The specific aim "is to identify and describe informal patient groups, and to discuss the reciprocal effects of the socialization process in such groups upon the more formal structures and functions of the psychiatric ward." Informal (friendship clique) and formal (group psychotherapy) groups are sampled, and some functions of each are described.—A. R. Howard.

6891. Cortner, Robert Harold. (St. Louis U.) The relation between morale and informal group structure in hospitals. *Dissert. Abstr.*, 1962, 22(11), 4072-4073.—Abstract.

6892. DeLange, Walter H. (U. Houston) Conceptions of patient role by patients and staff in a state mental hospital. *Dissert. Abstr.*, 1962, 22(7), 2461-2462.—Abstract.

6893. Gard, John Griffin. (U. Pittsburgh) Fundamental interpersonal relations orientations in clinical groups. *Dissert. Abstr.*, 1962, 22(11), 4080.—Abstract.

6894. Hutton, Geoffrey. (U. Edinburgh) Management in a changing mental hospital. *Hum. Relat.*, 1962, 15(4), 283-310.—The results of a 9-month study of changes in the authority structure of a hospital under social pressures are presented. "Emphasis upon active treatment, rapid turnover, and greater involvement of doctors in the actual lives of patients began to impose strain on the system. The system was initially a fairly stable but not necessarily efficient juxtaposition of a nurse-directed community and a number of medical practices. . . . Greater activity of the doctors lead to an unstable equilibrium . . . with an occasional breakdown in differentiation to a system of direct control by a divisional consultant." The system analysis is presented in terms of enterprise, viewed as an open system, and a hierarchy of tasks.—W. W. Meissner.

6895. Hutton, Geoffrey. (U. Edinburgh) Managing systems in hospitals: The implications of a case study. *Hum. Relat.*, 1962, 15(4), 311-333.—The implications of the results of a previously published case study (see 37: 6894) are analyzed for hospital management at different levels of the hierarchy. Implications of 3 models of administration are discussed: nursing direction, medical direction, and joint medical-nursing direction. The factors involved in the appropriate choice of alternative are presented in terms of control of the hierarchy of systems and operations.—W. W. Meissner.

6896. Jones, Maxwell. (Oregon State Hosp., Salem) Settings for treatment and training in social psychiatry. *Ment. Hosp.*, 1962, 13(12), 646-650.—Staff education, with particular reference to psychiatric residents, can be furthered by daily ward meetings of the therapeutic community. The author dissents from contemporary emphasis on the general hospital as necessarily the best setting for psychiatric treatment and cites advantages of a progressive mental hospital.—L. Gurel.

6897. Laybourne, Paul C., & Miller, Herbert C. Pediatric hospitalization of psychiatric patients: Diagnostic and therapeutic implications. *Amer. J. Orthopsychiat.*, 1962, 32(4), 596-603.—Short-term hospitalization of emotionally disturbed children on a pediatric ward can help to clarify diagnosis, interrupt symptomatology, and be particularly useful in the treatment of psychosomatic illnesses. Case material is presented to illustrate situations in which pediatric hospitalization has resolved problems which otherwise might not have been resolved on an outpatient basis.—R. E. Perl.

6898. Müller-Küppers, M. (Blumenstr. 8, Heidelberg, Germany) Aufbau, Funktion und Arbeitsergebnisse für das Jahr 1961 einer kinderpsychiatrischen Abteilung. [Structure, function, and results of work for the year 1961 of a child psychiatry department.] *Prax. Kinderpsychol. Kinderpsychiat.*, 1962, 11(5), 167-171.—Statistics of the patients in this clinic with 24 beds for 3-15 year old children and in the outpatient clinic (524 patients) as to medical and psychological symptoms, illnesses, referring agencies, number of contacts, and results of treatments are given.—E. Katz.

6899. Noshpitz, Joseph D. A smoking episode in a residential treatment unit. *Amer. J. Orthopsychiat.*, 1962, 32(4), 669-681.—The details of staff upheaval in a residential treatment center is described. The problem of granting permission to smoke to 2 14-year-old boys was at the base of the difficulty. A meeting was held 15 months after the event to attempt to discover how a well-trained, sophisticated staff could have handled the issue as awkwardly as it did. The author feels that there is something in the right to smoke, as in the right to drive, that is similar to a puberty rite—a sacred mystery to be tampered with at your peril.—R. E. Perl.

6900. Pearlin, Leonard I. (National Inst. Mental Health) Sources of resistance to change in a mental hospital. *Amer. J. Sociol.*, 1962, 68(1), 325-334.—The resistance of nursing personnel to proposed changes in the care of hospitalized mental patients is examined from questionnaires and from information about the wards to which personnel are assigned. Among those in higher positions, resistance is aroused when the changes are seen as interfering with desired relations with patients. Lower placed personnel view change from a different framework; this group opposes change when it is seen in conflict with the performance of ward maintenance functions. Resistance is least likely to be found on those wards where there is some advanced patient-care policy coupled with a leadership friendly to change.—R. M. Frumkin.

6901. Pitt, Brice, & Markowe, Morris. (St. Clement's Hosp., London, England) A new pattern in day hospital development: The West Middlesex Hospital. *Brit. J. Psychiat.*, 1963, 109(Whole No.

458), 29-36.—Admission policies, regime, treatment procedures, rehabilitation and after care emphases, and results are described.—W. L. Wilkins.

6902. Rosenberg, Morris, & Pearlin, Leonard I. (National Inst. Mental Health) Power-orientations in the mental hospital. *Hum. Relat.*, 1962, 15(4), 335-349.—Power attitudes in the interaction among personnel and patients in the mental hospital were studied by questionnaire method. Relations are discussed in the order of preference in terms of persuasion, benevolent manipulation, legitimate authority, contractual power, and coercion.—W. W. Meissner.

6903. Rosengren, William R. The hospital careers of lower-and-middle-class child psychiatric patients. *Psychiatry*, 1962, 25(1), 16-22.—A study of the behavior of child psychiatric patients from different social classes, who were treated at a residential treatment center. The 20 Ss were selected from discharge files and had been diagnosed as passive-aggressive personality, aggressive type. Conclusions were based upon case records which included case-work interviews, psychiatric referrals, psychological and neurological examinations, teacher reports, and staff conference reports.—H. M. Cohen.

6904. Rubin, Eli Z. (Lafayette Clinic, Detroit, Mich.) Special education in a psychiatric hospital. *Except. Children*, 1962, 29(4), 184-190.—The philosophy inherent in this educational setting is discussed. A description is then given of the school program at the Lafayette Clinic, a psychiatric hospital.—J. Z. Elias.

6905. Scofield, John B. Adolescent treatment in an adult hospital. *Amer. J. Orthopsychiat.*, 1962, 32(4), 660-668.—Some aspects of the treatment of 46 adolescent patients in the Menninger Memorial Hospital designed for adults are discussed. If adequate school and recreational facilities can be provided together with intensive individual treatment, it seems that older adolescent patients can be integrated into an adult hospital. Some advantages are the stabilizing influence of adults, the possibility of exploiting adult environment to encourage maturation and to minimize the destructive influence of peer group formation during the early phase of treatment.—R. E. Perl.

6906. Snow, Herman B. (Hudson River State Hosp., Poughkeepsie, N. Y.) The hospital we opened: Some comments in retrospect. *Ment. Hosp.*, 1962, 13(11), 573-579.—The former superintendent of St. Lawrence State Hospital, Ogdensburg, New York, describes the process and results of conversion to a system of unlocked wards and increased patient freedom.—L. Gurel.

6907. Stumpf, John Cecil. (U. Utah) Communication abilities of Veterans Administration nurses. *Dissert. Abstr.*, 1962, 22(9), 3268-3269.—Abstract.

6908. Toobert, Saul; Scott, Frances G., & Lewis, John D. (California Dept. Mental Hygiene) Relation of various indicators of ward management to measures of staff attitudes in a large mental hospital. *J. Hlth. hum. Behav.*, 1962, 3(3), 185-193.—The Levinson Custodial Mental Illness Ideology Scale (CMI) and California Authoritarianism Scale (F Scale) were used to relate measures of staff custodialism and staff authoritarianism to 13 ward manage-

ment indicators. "Low custodialism and low authoritarianism, as well as medium concordance, of staff attitudes were found related to more patients (1) having privilege cards, (2) having off-ward details, (3) having some kind of work detail, (4) attending rehabilitation therapy dances." Likewise, low custodialism was found related to certain types of patients.—*L. A. Ostlund.*

Community Services

6909. Bellows, Helen Elizabeth. (Washington U.) A study of concepts used on community organization, group work, and casework. *Dissert. Abstr.*, 1962, 22(8), 2894-2895.—*Abstract.*

6910. Dinsfriends, Robert. (Jewish Family Service, Worcester, Mass.) Meeting the needs for psychiatric services in the smaller community: A Jewish family agency role. *J. Jewish communal Serv.*, 1962, 39(1), 79-82.—The importance of meaningful cooperation and communication as well as a full awareness of available resources by and among all social agencies in a community is stressed. Worcester, Massachusetts, is used as an example of successful efforts in this direction with particular attention to how the psychiatric needs of the community are being met and the specific role which the Jewish Family Service has been and will continue to play.—*M. A. Seidenfeld.*

6911. Hes, Yosef. (Dept. Social Psychiatry, Talbiye, Jerusalem) Tokhnit kehilatit liveriut hanefesh shel holim psikhotiyim. [Community program of mental health for psychotic patients.] *Dap. refuim*, 1962, 21, 519-523.—Psychotic and postpsychotic patients should be examined to select those suited for a day hospital or family care. Many show more improvement in such a milieu than in a closed institution. A family care system is described and its value stressed on the basis of experiences of the Amsterdam municipal psychiatric service and of studies carried out in the States. A research project was initiated in Israel. (English & French summaries)—*H. Ormian.*

6912. Himmelfarb, Cynthia, & La Pan, Richard. (Hebrew Educational Society, Brooklyn, N. Y.) An experience in serving deviant young adults in a Jewish community center. *J. Jewish communal Serv.*, 1962, 38(4), 398-406.—A description of 2 years experience in serving the needs of socially inept and mentally retarded young males have resulted in the conclusion that deviant and normally functioning young adults can and should be served in a Jewish community center.—*M. A. Seidenfeld.*

6913. Levy, Charles S. (Yeshiva U.) The Jewish community center as milieu therapy. *J. Jewish communal Serv.*, 1962, 39(1), 60-67.—The Jewish community center is viewed as a multidimensional social agency which is capable of serving as a psychotherapeutic modality which follows the objectives of milieu therapy if effecting psychosocial modifications and growth in its members.—*M. A. Seidenfeld.*

6914. Maclay, W. S. Plan para un servicio de salud mental. [A plan for a mental health service.] *Acta psiquiat. psicol. Argent.*, 1962, 8(1), 2-3.—Recommendations for improvement of mental health facilities based on experience in England and 2 underdeveloped nations: (a) the service should be directed

by the same administrators of the general health service and should not be made a separate department; (b) a nucleus of well-trained psychiatrists, psychologists, and nurses should be formed to instruct and assist larger numbers of less well-trained personnel; (c) a large psychiatric unit should be established in the principal city with at least 100 beds plus outpatient facilities; and (d) as soon as possible after the previous suggestions have been realized, the existing psychiatric hospital should be replaced by an occupational village for chronic and geriatric patients.—*W. W. Meissner.*

6915. Samora, Julian; Saunders, Lyle, & Larson, Richard F. (U. Notre Dame) Knowledge about specific diseases in four selected samples. *J. Hlth. hum. Behav.*, 1962, 3(3), 176-184.—The level of knowledge concerning many aspects of 10 diseases was compared for patients in Denver, Reading, South Bend, and New York. Information about tuberculosis was most known, whereas leukemia rated lowest. Sex, age, and ethnicity were not significant variables, but education and socioeconomic position were. "In conclusion, it is evident from this report that the level of health knowledge among the respondents sampled is sufficiently low to be a potential barrier to effective physician-patient communication. Awareness of this generally low level of knowledge and the social factors with which it is associated may be important in effective communication between patients and physicians."—*L. A. Ostlund.*

Case Work

6916. National Conference on Social Welfare. The social welfare forum: 1961. New York: Columbia Univer. Press, 1961. xvi, 325 p.—This consists of the papers delivered at the 88th annual forum. The papers are classified under 4 main categories: "Toward Elimination of Poverty," "Social Work Practice," "International Social Welfare," and "Perspectives."—*G. Elias.*

6917. Waltuck, Murray. (Jewish Family Service, NYC) Diagnostic criteria and treatment methods in averting child placement. *J. Jewish communal Serv.*, 1962, 38(4), 376-384.—Waltuck reports on a tri-partite study of the effect of intensive casework services in aiding families with manifest ambivalence to placement of their child or in which potential to remain intact was considered likely by the child care worker. Emphasis is placed upon the observation that placement of a child should be viewed as a serious symptom of more profound family emotional illness. Treatment of this illness must be undertaken if the child-family disturbance symptom is to be cured.—*M. A. Seidenfeld.*

COUNSELING & GUIDANCE

6918. Adams, James F. (Temple U.) Problems in counseling: A case study approach. New York: Macmillan, 1962. 164 p. \$2.25 (paper).—25 summaries of cases—varying in complexity of problem presented, in technique of approach to the counseling process, and in the level of progress attained both in the counseling relationship and in the solution of the problem—are presented as a supplementary text to stimulate discussion in a course in counselor training. Preceded by a concise survey of counseling theories

and techniques which determine the role of the counselor in the counseling process, the book terminates with a chapter discussing the counselor's ethical responsibilities regarding the welfare of the counselee. Cases presenting problems in educational, vocational, and personal counseling were drawn from elementary school, secondary school, and university counseling and from private agency and private practice sources.—*I. Linnick.*

6919. Baurenfeind, Robert H. (National Coll. Education, Evanston, Ill.) The matter of "ipsative scores." *Personnel Guid. J.*, 1962, 41(3), 210-217.—"Free-response interest scores can be interpreted in a straightforward way, whereas ipsative scores cannot. Free-response scores have more potential for predicting free-response and power-of-performance behaviors than do ipsative scores. And, free-response scores can be readily converted to ipsative scores if one wants to. Alerted to the issues presented in this article, however, we wonder how many counselors will want to." (32-item bibliogr.)—*S. Kavruck.*

6920. Campbell, Robert Edward. (Ohio State U.) Influence of the counselor's personality and background on his counseling style. *Dissert. Abstr.*, 1962, 22(10), 3739-3740.—*Abstract.*

6921. Drechsler, Robert J., & Shapiro, Marvin I. A procedure for direct observation of family interaction in a child guidance clinic. *Psychiatry*, 1961, 24(2), 163-170.—This paper describes a procedure by which direct observations of samples of family interaction in cases of child pathology were made of 5 families in a child guidance clinic.—*C. T. Morgan.*

6922. Kemp, C. Gratton. (Ohio State U.) Influence of dogmatism on the training of counselors. *J. counsel. Psychol.*, 1962, 9(2), 155-157.—Counselor-trainees scoring high on dogmatism change in a permissive and supportive direction on Porter's Test of Counselor Attitudes but toward evaluation and diagnostic responses in actual counseling. Low scorers change less, and there are no differences between actual and hypothetical situations.—*E. R. Oetting.*

6923. Landy, Edward, & Scanlan, Edward. Relationship between school guidance and psychotherapy for adolescents. *Amer. J. Orthopsychiat.*, 1962, 32(4), 682-690.—The school guidance program and psychotherapy should be collaborative and complementary. This is possible only in those guidance situations that provide professional personnel with training and competence. Ego counseling in the schools as the core of guidance focuses on work. The capacity to love is a problem that guidance leaves to the psychotherapist.—*R. E. Perl.*

6924. McNeil, Elton B., & Cohler, J. Robert, Jr. (U. Michigan) The effect of personal needs on counselor perception and behavior. *Pap. Mich. Acad. Sci. Arts Lett.*, 1957, 42, 281-288.—The Ss were 18 male and 15 female counselors who participated in the 1955 session of the University of Michigan Fresh Air Camp. The MMPI, Personal Preference Scale, Elias Family Opinion Survey, and a self-rating inventory were accomplished at time of application for position. Data on hostility and aggression were later obtained. "Under-reporters" of aggressive themes on 4 TAT cards were "our most

successful counselors . . . in handling hostile interpersonal relations with disturbed boys." An "exploratory model for the analysis of data referring to the personal characteristics of our subjects is provided. Finding are considered preliminary."—*S. J. Lachman.*

6925. Pepinsky, Harold B. (Ohio State U.) Some further observations on inference. *J. counsel. Psychol.*, 1962, 9(2), 180-183.—Comments on Milgram's article "Nationality and Conformity" (see 36: 4GB45M). Inadequate cultural considerations are stressed.—*E. R. Oetting.*

6926. Schröter, Ursula. (Fürth, Bavaria, Germany) Die Tätigkeit des Sozialarbeiters im Team der Erziehungsberatungsstelle. [The work of the social worker in the team of the child guidance clinic.] *Prax. Kinderpsychol. Kinderpsychiat.*, 1962, 11(6), 222-226.—General education, special training, tasks and team interaction, and special contributions of the social worker in the agency are described.—*E. Katz.*

6927. Schwebel, Milton. (New York U.) Some missing links in counseling theory and research. *Personnel Guid. J.*, 1962, 41(4), 325-331.—The causes of problems in counseling are the important missing links. When the causes of school failure are known, the counselor will not need to resort to unstable theories about the unconscious or about native dullness. Research into causation is essential.—*S. Kavruck.*

6928. Stearns, Jane Alice. (Washington U.) Clients' perceptions of selected attitudes of social workers as an influence on continuance in counseling. *Dissert. Abstr.*, 1962, 22(8), 2879-2880.—*Abstract.*

6929. Strean, Herbert S. A means of involving fathers in family treatment: Guidance groups for fathers. *Amer. J. Orthopsychiat.*, 1962, 32(4), 719-727.—Work with a group of fathers, each of whom refused to participate in 1-to-1 treatment, yielded both negative and positive results. Some men withdrew because a fathers' group aroused more homosexual anxiety or aggression than could be tolerated. For others the group was a means for uniting a weak, passive, threatened father with his family, giving him some strength to cope with the burdens of being a parent, and helping him to enjoy some of its pleasures.—*R. E. Perl.*

6930. Tyler, Leona E. (U. Oregon) Research on instruments used by counselors in vocational guidance. *J. counsel. Psychol.*, 1962, 9(2), 99-105.—Aptitude tests aid in counseling but not prediction. Interest tests show both validity and limitations. We need developmental data and new approaches.—*E. R. Oetting.*

6931. Wigell, W. W., & Ohlsen, M. M. To what extent is affect a function of topic and referent in group counseling? *Amer. J. Orthopsychiat.*, 1962, 32(4), 728-735.—A content analysis was made of the interactions within a counseling group of 8 9th-grade, gifted underachievers, in terms of topic, referent, and affect. Referent seemed to contribute little to the understanding of the counseling process, but the other 2 should be studied further. Combining interactions for either a group of clients or a group of sessions seems to disguise significant results. Significant interactions are missed without a record of nonverbal as well as verbal behavior.—*R. E. Perl.*

MARRIAGE & FAMILY PROBLEMS

6932. Eysenck, S. B. G., & Eysenck, H. J. (Inst. Psychiatry, U. London, England) **Rigidity as a function of introversion and neuroticism: A study of unmarried mothers.** *Int. J. soc. Psychiat.*, 1962, 8(3), 180-184.—A comparative study of 100 married and 100 unmarried mothers indicates that they did not differ in their rigidity and intelligence scores, but unmarried mothers were significantly more extraverted and more neurotic than married mothers.—R. M. Frumkin.

6933. Goode, W. J. (Columbia U.) **Marital satisfactions and instability: A cross-cultural analysis of divorce rates.** *Int. soc. Sci. J.*, 1962, 14(3), 507-526.—The author presents both theoretical and empirical evidence of an inverse relationship between social class and divorce rates, higher divorce rates being observed among lower-class marriages. Cross national analysis of available divorce statistics tends to confirm this hypothesis.—A. Barclay.

6934. Honoré B. (Centre National Pédagogie Familiale) **La formation en psycho-pédagogie familiale.** [Formation in family psychopedagogy.] *Hyg. ment.*, 1962, 51(4), 202-212.—Discussion of steps which have been taken to provide a "school for parents" in which psychological and educational problems can be studied. The necessity of a coordinating service to bring the various aspects and agencies of the social, psychological, and educational dimensions of family life to bear on concrete problems is discussed.—W. W. Meissner.

6935. Kharchev, A. G. (Acad. Sciences, Leningrad, USSR) **Problems of the family and their study in the USSR.** *Int. soc. Sci. J.*, 1962, 14(3), 539-549.—A discussion of the differences between Soviet and Western approaches to sociology, emphasizing that the study of the family unit is of primary importance to Soviet sociologists.—A. Barclay.

6936. Kiser, Clyde V. (Ed.) **Research in family planning.** Princeton, N. J.: Princeton Univ. Press, 1962. xv, 662 p. \$12.50.—35 papers concerned with the problem of population expansion presented at an interdisciplinary research conference sponsored jointly by the Milbank Memorial Fund and the Population Council in 1960. Problems of family planning in different parts of the world are analyzed, including India, Japan, and other Asiatic countries; the Middle East; Latin America; Europe; and the United States. Major topics covered include: attitudes toward family planning, effectiveness of specific birth control devices and techniques, motivational and educational aspects, and future research problems.—D. G. Brown.

6937. Loesch, John G., & Greenberg, Nahman H. **Some specific areas of conflicts observed during pregnancy: A comparative study of married and unmarried pregnant women.** *Amer. J. Orthopsychiat.*, 1962, 32(4), 624-636.—A group of graduate student wives who were pregnant were compared with a group of unwed pregnant girls living in an institution. The unwed mothers usually suffered some object loss just prior to pregnancy and at least $\frac{1}{2}$ of them expressed a conscious wish for pregnancy as a possible way of forcing continuation of a threatened relationship. Their major concerns were with giving up the infant and with the wish to have a dependent

relationship with a man. The married mothers' main concerns were over bodily changes and apprehension about the pain of labor, whether the infant would be normal, an increased feeling of dependency and irritation toward the husband, and how they might function as a mother. For both groups pregnancy seemed to be a period of mixed feelings with underlying moods of anxiety and depression.—R. E. Perl.

6938. Nakano, T. (Tokyo Kyoiku U.) **Recent studies of change in the Japanese family.** *Int. soc. Sci. J.*, 1962, 14(3), 527-538.—An analysis of social changes and their impact on Japanese family organization.—A. Barclay.

6939. Schlesinger, Benjamin. (Cornell U.) **Development of interspousal participation in decision making of college educated couples.** *Dissert. Abstr.*, 1962, 22(11), 4074-4075.—Abstract.

6940. Schorr, Alvin. (Washington, D. C.) **Family policy in the United States.** *Int. soc. Sci. J.*, 1962, 14(3), 452-467.—"In brief, we have reviewed a number of deep-rooted traditions . . . which have influenced the development of policies affecting families. . . . At present, the family is taking on new significance. . . . Individuals find value in themselves in their families in a way that is . . . rare in other-institutions. As this trend continues we may . . . have a situation in which individual and family goals are fully consistent. We may, therefore, anticipate increasing evidence in national policy of the importance of the family."—A. Barclay.

6941. Talmon-Garber, Y. (Hebrew U., Jerusalem, Israel) **Social change and family structure.** *Int. soc. Sci. J.*, 1962, 14(3), 468-487.—Analysis of the impact of social change on Israeli family life suggests that such changes tend to bring about conflicting foci of identification such that divided loyalty may occur; i.e., the community itself vies with the family members for their support. The operation of this phenomenon is investigated among families in the Kibbutzim and the Moshavim as well as in isolated refugee families.—A. Barclay.

6942. Tharp, Roland George. (U. Michigan) **A factor analytic study of marriage-roles: Expectations and perceived enactments.** *Dissert. Abstr.*, 1962, 22(7), 2470-2471.—Abstract.

MENTAL HEALTH & REHABILITATION

6943. Allinsmith, Wesley, & Goethals, George W. **The role of schools in mental health.** New York: Basic Books, 1962. (Jt. Commission Ment. Illness Hlth. monogr. Ser., No. 7) xiv, 337 p. \$7.50.—An interpretive commentary, based on a survey of 5000 books and articles, on the broad range of mental health problems and practices from nursery schools through universities. Part II is a technical report by W. Cody Wilson and G. W. Goethals exploring sources of tension suggested in the literature. Implications for mental health are discussed in terms of values and norms as perceived by teachers and students. The questionnaire, statistical tables, and a 17 page bibliography are appended.—H. P. David.

6944. Bank Street College of Education. **Integration of mental health concepts with the human relations professions.** New York: BSCE, 1962. x, 132 p. \$2.00.—Proceedings of a lecture series memorializing the late Ruth Kotinsky. 9 contributors from

the fields of education, medicine, psychology, law, religion, nursing, social work, and dentistry attempt to provide answers to the question which her work raised: how can psychodynamic theory and psychiatric research findings be put to use by practitioners other than psychotherapists? The contributors maintain that the professions may better approach their own independent goals through a deeper understanding of human behavior and its motives. The powerful force of emotion affects what an individual believes, how he learns, what crimes he commits, his physical well-being, and how he responds to help.—C. H. Miley.

6945. Brooks, George W., & Deane, William N. (Vermont State Hosp., Waterbury) Rehabilitation of severely disabled hospitalized mental patients. *J. Rehabil.* 1962, 28(5), 13-14.—A description of the comprehensive social psychiatric program for schizophrenic patients at Vermont State Hospital.—M. A. Seidenfeld.

6946. French, John R. P., Jr., Kahn, Robert L., & Mann, Floyd C. (Eds.) Work, health and satisfaction. *J. soc. Issues*, 1962, 18(3), 1-129.—"This issue of the Journal is devoted wholly to the work of a new research program on mental health. . . . The primary objective of the program . . . is to develop a research approach and a body of theory which treats fully the influences of the contemporary environment on mental health. . . . The initial article by French and Kahn . . . proceeds to examine its approach to the self, to the organizational environment, and to criteria of mental health. The article by [Alvin] Zander and [Robert] Quinn . . . is a thorough review of findings from earlier work . . . which have relevance to problems of mental health." The remaining articles are: "The Effects of Occupational Status on Physical and Mental Health" (S. V. Kasl & French), "Some Effects of the Changing Work Environment in the Office" (Mann & L. K. Williams), "A Study of Tensions and Adjustment under Role Conflict" (D. M. Wolfe & J. D. Snoek), and "A Summary and Some Tentative Conclusions" (Kahn & French).—A. Barclay.

6947. Lefton, Mark; Angrist, Shirley; Dinitz, Simon, & Pasamanick, Benjamin. (Ohio State U.) Social class, expectations, and performance of mental patients. *Amer. J. Sociol.*, 1962, 68(1), 79-87.—The influence of social class and expectations on the post-hospital performance of 62 married female mental patients is examined. Both class and expectations were posited as interrelated determinants of performance. The results indicate that this thesis is highly questionable. Social class did not correlate significantly with performance. Patient expectations, on the other hand, were related to such performance in the working class but not in the middle class. The findings suggest that for these cases, disease manifestations are more significant than class and expectations as criteria of post-hospital adjustment.—R. M. Frumkin.

6948. McCann, Richard V. The churches and mental health. New York: Basic Books, 1962. (Jt. Commission Ment. Illness Hlth. Monogr. Ser., No. 8) x, 278 p. \$6.00.—An exploration of the changing roles and concepts among 235,000 clergymen of all faiths, the work of mental hospital chaplains, trends in pastoral counseling, and mental health aspects of theological education. Survey findings on demo-

graphic and personal factors related to church membership are considered along with recommendations on how churches can strengthen their contributions to mental health. A list of 73 pastoral counseling centers is appended. (117 ref.)—H. P. David.

6949. Mahlman, Richard William. (U. Minnesota) Assessing vocational interests of mental patients. *Dissert. Abstr.*, 1962, 22(8), 2876-2877.—Abstract.

6950. Newstrom, Charles Neil. (U. Minnesota) An outcome study of emotionally disturbed and physically disabled veterans rehabilitated at the professional level of education. *Dissert. Abstr.*, 1962, 22(11), 4074.—Abstract.

6951. Nigam, K. P. (Mental Hosp., Agra, India) Mental illness: It is preventable? *Agra U. J. Res.*, 1962, 10, 119-123.—A review of various studies shows that the problem of prevention can be tackled with joint enforcement of suitable measures by the various social sciences.—U. Pareek.

6952. Patterson, C. H. (U. Illinois) Selection of rehabilitation counseling students. *Personnel Guid. J.*, 1962, 41(4), 318-324.—No perfect selection procedure appears to be immediately in sight. Consideration should be given to continued use of tests of scholastic aptitude and to a practicum and work sample approach in evaluation. The use of rigid procedures involving personality tests is not recommended; however, the interview, supplemented with data from personality and interest tests may have value. Selection is not a single event, but a process.—S. Kavruck.

6953. Patterson, C. H. (U. Illinois) Test characteristics of rehabilitation counselor trainees. *J. Rehabil.* 1962, 28(5), 15-16.—The Miller Analogies Test, Edwards Personal Preference Schedule, the MMPI, Strong Vocational Interest Inventory, and the Kerr-Speroff Empathy Test were administered to approximately 550 students enrolled in graduate work in rehabilitation counseling in 20 colleges and universities. Analysis of the data leads Patterson to conclude that the institutions training rehabilitation counselors are selecting students who give evidence of characteristics generally considered desirable in counselors. They seem to have patterns of interest in the helping, social welfare, and psychological professions. Personnel administration is also an area of interest. Rehabilitation counselors seem to have above average empathy, interest in people, and in understanding them. They are self-confident, without undue guilt-feelings, and willing to listen to others and accept suggestions.—M. A. Seidenfeld.

6954. Rothaus, Paul, & Morton, Robert. (VA Hosp., Houston, Tex.) Problem-centered versus mental illness self-descriptions. *J. Hlth. hum. Behav.*, 1962, 3(3), 198-203.—The effect of negative public attitudes toward mental patients upon the patients themselves was investigated. "Participants in the Fourth Human Relations Training Laboratory at the Houston Veterans Administration Hospital took part in a role-playing exercise concerning job interviews. Sixteen participants took the role of employers and rated two job applicants; each of whom described himself and his hospitalization in either problem-centered or mental illness terms. Reactions were considerably more positive toward problem-

centered self-descriptions. Three reasons for the results were considered: (a) the criteria for selecting the participants; (b) the value orientation of the laboratory; (c) stereotyped semantic reactions to the concept of mental illness."—*L. A. Ostlund.*

6955. Thompson, Everett Frederick. (U. Denver) *The Clinical Word Association Test as a quantitative measure of social remission.* *Dissert. Abstr.*, 1962, 22(10), 3742-3743.—*Abstract.*

6956. Tooth, G. C. (Ministry Health, London, England) *Progresos en salud mental.* [Progress in mental health.] *Acta psiquiat. psicol. Argent.*, 1962, 8(1), 4-7.—An account of psychiatric progress in England in the last 3 years. The emphasis on preventive psychiatry in the development of services to the community, growth in facilities for the care of the aged, particularly in terms of mobilization of community resources, increased cooperation between mental hospital and the community, development of facilities for short-term treatment, and establishment of special hospitals for "psychopaths," are singled out for comment. The most significant single event was passage of the Mental Health Act in 1959.—*W. W. Meissner.*

6957. Whitehouse, Frederick A. (American Heart Ass., NYC) *Barriers to rehabilitation.* *Amer. J. occup. Ther.*, 1962, 16(5), 236-240.—A discussion of rehabilitation as a philosophy and the factors which the author considers create pseudo-barriers to the advancement of the rehabilitation process. These he concludes to be largely ignorance, lack of courage, or lack of willingness to set higher level of commitments to the task.—*M. A. Seidenfeld.*

6958. Yeracaris, Constantine A. (State U. New York, Buffalo) *Social factors associated with the acceptance of medical innovations: A pilot study.* *J. Hlth. hum. Behav.*, 1962, 3(3), 193-198.—Interviews with 1/3 of 1647 Buffalo high school students' parents were used to determine barriers to health programs. Among the conclusions are: "The conditions for the effectiveness of programs of public health undertaken to induce our citizens to adopt health measures deemed desirable are: consensus on health values, attitudes, and practices and compatibility between these and the new health measures. Given a heterogeneous society with groups of different and often conflicting norms, values, and practices, health programs must be planned in such a way as to appeal to different social and cultural segments of our society."—*L. A. Ostlund.*

ABNORMAL PSYCHOLOGY

6959. Astigueta, Fernando D. *Psiquiatría y sociología.* [Psychiatry and sociology.] *Acta psiquiat. psicol. Argent.*, 1962, 8(1), 41-45.—Freudian and adaptational influences on sociology are contrasted. The psychoanalytic orientation explains human behavior and social institutions as products of the operation of defense mechanisms (repression) on instincts. The libidinal adaptation of each cultural group depends on the level of fixation reached in the course of libidinal development, and the edipal complex is postulated as a constant in all cultural maturation. The adaptational orientation, however, emphasizes the interaction between individual and environ-

ment. Both variables are operative in the integration of the personality.—*W. W. Meissner.*

6960. Boisen, Anton T. *The exploration of the inner world: A study of mental disorder and religious experience.* New York: Harper (Torchbook), 1962. x, 322 p. \$1.75 (paper).—First published in 1936, this book on the relation of mental illness to religious experience is reissued in a paperback edition. In Part I, "A Journey of Exploration," the author and his students examine the environmental influences, sexual and vocational adjustments, social relations, religious concerns, and the thought content during acute disorders of 173 mental patients who had been evaluated for physiological causation by a group of endocrinologists in the chapter entitled "The Wilderness of the Lost." Other chapters in Part I are "Some Successful Explorers," and "George Fox Among the Doctors." In Part II, "Theoretical Implications," the chapters are entitled: "The Messianic Consciousness," "The Battleground of Character," "The Problem of Right and Wrong," and "The Queen of the Sciences." Part III, "Practical Applications," deals with religion as an attempt to grapple with the realities of life. Chapters are "Where Priest and Physician Meet," "The Church in Action," "Clinical Experience in the Service of the Mentally Ill," "The Distinctive Task of the Minister of Religion," and "The Interrelationship of Individual and Social Salvation."—*G. K. Morlan.*

6961. Brain, R. (86 Harley St., London, England) *The languages of psychiatry.* *Brit. J. Psychiat.*, 1963, 109 (Whole No. 458), 4-11.—A description of the data of psychiatry includes language from anatomy, physiology, psychopathology, learning theory, pharmacology, and typology. Complexity of causality adds an additional difficulty. Because of the legal aspects of responsibility, which means answerable to the law, and the fact that such responsibility is determined by psychiatrists in complicated cases, there is a problem in translation from one of these languages to another, but since no one of these languages is sufficient for the problems described, psychiatry needs all of them.—*W. L. Wilkins.*

6962. Cammer, Leo. (New York Medical Coll.) *Outline of psychiatry.* New York: McGraw-Hill, 1962. xi, 398 p. \$5.95.—Developed in a sequential style, the outline presents a historical review, etiologic and biologic considerations, fundamentals of psychoanalysis and ecology, psychopathology and classification of mental disorders, and a summary of psychiatric therapies. The extensive appendices include an outline for taking psychiatric histories, principles of psychodiagnosis, synopses of frequently encountered clinical syndromes, a review of forensic aspects, and a listing of early contributors to psychiatric history. (60 ref., 8-p. bibliogr.)—*H. P. David.*

6963. Meyer, Ruben; Levitt, Morton; Falick, Mordecai L., & Rubenstein, Ben O. (Wayne State U.) *Essentials of pediatric psychiatry.* New York: Appleton-Century-Crofts, 1962. x, 208 p.—The purpose of this volume is to provide the pediatrician with psychological and psychiatric concepts about children, and to clarify his role with patients. Highlighted is the trend away from physiological to psychological problems and/or preventive psychiatry. The authors admit bias in restricting the psychotherapeutic activities of pediatricians. Psychoanalytic

and developmental concepts dominate, while group and cultural aspects are minimized. Key chapters are entitled: "Psychic Development," "Infancy and Childhood: Normal Development and its Problems," "Emotional Reactions to Trauma and Hospitalization," "Serious Disorders of Development," "The Brain Damaged and Mentally Defective Child," and "Diagnosis and Treatment." Suggestions concerning diagnosis and treatment include examples.—*L. A. Ostlund.*

PHYSICAL HANDICAPS

6964. Garrett, James F., & Levine, Edna S. (Eds.) *Psychological practices with the physically disabled.* New York: Columbia Univer. Press, 1962. xi, 463 p. \$8.75.—The rehabilitation of the physically disabled has become a matter of great concern, particularly in regards to its psychological aspects. The book covers the psychological practices in 12 disability groups. Each chapter deals with the major influences, problems, and procedures in terms of (a) the medical-physical aspects; (b) the psychological implications both in regard to the individual as well as to the family, the community, and the sociocultural and vocational milieu; (c) special considerations in psychological appraisal, such as test modification; (d) special considerations in psychological treatment and rehabilitation; and (e) research findings and needs. The book deals with the following disabilities: amputation (S. Fishman), arthritis and rheumatism (M. A. Seidenfeld), cardiovascular disability (F. A. Whitehouse), hemiplegia (L. Diller), cerebral palsy (R. M. Allen), language disorders (J. M. Wepman), cancer (B. Cobb), facial disfigurement (R. Madan), auditory disability (E. S. Levine), visual disability (N. J. Raskin), deaf-blindness (J. Rothschild), and severe chronic illness (F. C. Shontz).—*V. Sanua.*

Blindness

6965. Ashcroft, Samuel C. (George Peabody Coll. Teachers) *Programmed instruction in braille.* *Int. J. Educ. Blind*, 1961, 11(2), 46-50.—To teach basic mastery in reading and writing Braille in 5 weeks, a specialized text was developed incorporating the principles of programed instruction as used in teaching machines. The Braille code is divided into 8 units for instructional purposes. After adequate mastery at each unit level is attained, as ascertained by a unit test, the next unit is undertaken. 16 students were enrolled in a course using this text. None failed; none dropped out. Validity of the text as a teaching technique is indicated from the correlation of unit test scores with proficiency test scores (.90) and the correlation of final examination scores with proficiency test scores (.77). Correlation of scores from the unit tests and the final examination was .73. A limiting feature of the text is that it can be used only with those who are able to read and write in print.—*J. E. Morris.*

6966. Bateman, Barbara. (U. Illinois) *Sighted children's perceptions of blind children's abilities.* *Except. Children*, 1962, 29(1), 42-46.—232 sighted children in Grades 3 through 8 were asked whether blind children their own age could perform certain activities. Ss with limited contacts with blind children tended to under-rate them.—*J. Z. Elias.*

6967. Bauman, Mary K., & Strausse, Susan H. (Personnel Research Cent., Philadelphia, Pa.) *A*

comparison of blind children from day and residential schools in a camp setting. *Int. J. Educ. Blind*, 1962, 11(3), 74-77.—79 Ss, 36 from day schools and 43 from residential schools, were rated on 15 traits to ascertain their social competency. Ratings represented pooled opinions of the counseling staff. Correlation between all social competency scores with age was .36 and with IQ was .41. Comparison of the scores for the 2 groups favored the children from residential schools; however, the T score was only 2.06.—*J. E. Morris.*

6968. Davis, Carl J., & Nolan, Carson Y. (Perkins School for the Blind) *A comparison of the oral and written methods of administering achievement tests.* *Int. J. Educ. Blind*, 1961, 10(3), 80-82.—Braille adaptations of the Stanford Achievement Tests require that the administration be partially by having the S read the text and partially by having the text material read by the examiner. Subtests administered by the latter method enable Ss to attempt each item. To determine whether the use of sighted norms is appropriate with this modification of administration, 336 Braille-reading Ss, Grades 5-9, were given the appropriate word meaning subtest; Form M by written means, Form K orally. Results of an analysis of variance showed that, "the difference between scores obtained by written and oral methods was significant. The oral method produced the higher scores. However, these differences were significant only in the case of the lowest grade at each level of the test."—*J. E. Morris.*

6969. Foulke, Emerson; Amster, Clarence H., Nolan, Carson Y., & Bixler, Ray H. (U. Louisville) *The comprehension of rapid speech by the blind.* *Except. Children*, 1962, 29(3), 134-141.—"It was felt that those losses in comprehension that were statistically significant were not at all educationally important, especially when the time saved in presenting the material was considered."—*J. Z. Elias.*

6970. Jordan, John F., & Hunter, William F. *Counseling the blind.* *Int. J. Educ. Blind*, 1961, 11(1), 4-9.—A discussion of "some of the theoretical assumptions, practical problems, procedures, and methodology involved in counseling the blind and . . . an operational approach to guide the counselor in helping such individuals to adjust to the world at large."—*J. E. Morris.*

6971. Morris, June E., & Nolan, Carson Y. (American Printing House for the Blind) *Discriminability of tactual patterns.* *Int. J. Educ. Blind*, 1961, 11(2), 50-54.—96 legally blind Ss, Grades 4-12, judged a randomized paired-comparison arrangement of 12 areal type tactual patterns produced in Virkotype (a printing process utilizing plastic ink to achieve an embossed effect) in order to determine which were highly discriminable. 5 patterns qualified, being confused less than 10% of the time with any other pattern or themselves. Differences between grade placement and sex and their interaction were not significant. Correlation of scores with CA was not significant; however, correlation of scores with IQ was. The need for an adequate tactual symbolism for graphic communication to be used in combination with Braille is noted.—*J. E. Morris.*

6972. Nolan, Carson Y. (American Printing House for the Blind) *Legibility of ink and paper color combinations for readers of large type.* *Int.*

J. Educ. Blind, 1961, 10(3), 82-84.—12 partially sighted boys in Grades 5-11 judged the direction of openings in Landolt rings printed in "job black" or "lustre blue" ink on the following 5 paper colors: white, off-white, light buff, ivory, and canary. The rings were successively diminished in size so that the openings decreased from $1\frac{3}{4}$ in. in width to $\frac{3}{4}$ in. in steps of $\frac{1}{4}$ in., the direction of the openings being varied randomly through 8 equally spaced circular positions. The stimuli were exposed at a distance of 175 cm. from the plane of the eye. No significant differences in legibility was found among the 10 paper-and-ink-color combinations.—*J. E. Morris*.

6973. **Weiner, Lawrence H.** (New York State School for the Blind) **Educating the emotionally disturbed blind child.** *Int. J. Educ. Blind*, 1962, 11(3), 77-79.—Assuming that the educable but emotionally disturbed blind child is either consciously or unconsciously manipulating his disturbance in a way enabling him to avoid reality, his teacher must "enforce reality" upon him by "making the child aware of expectations and leading him to them, and not allowing any retreat from those expectations deemed important for life adjustment." 5 steps for achieving this goal are presented.—*J. E. Morris*.

Deafness

6974. **Butterfield, Gail.** (Mansfield State Training School, Conn.) **A note on the use of cardiac rate in the audiometric appraisal of retarded children.** *J. speech hear. Dis.*, 1962, 27(4), 378-379.—3 retarded children and 2 college students were used as Ss, all of whom had apparently normal thresholds for speech sounds. There was no alteration in the heart rate of mentally retarded children during the presentation of the 40 db. tones, but a significant change in the heart rate of normal Ss. The effect of such sounds on the heart rate cannot be used in cases of mentally retarded children with mental ages below 3 years.—*M. F. Palmer*.

6975. **Farrant, Roland Harvard.** (Northwestern U.) **A factor analytic study of the intellectual abilities of deaf and hard of hearing children compared with normal hearing children.** *Dissert. Abstr.*, 1962, 22(8), 2870-2871.—*Abstract*.

6976. **Henderson, Sara Cook, & Francis, Doris H.** (Eds.) **The meaning of deafness: Report of a workshop for audiologists.** *Amer. Ann. Deaf.*, 1962, 107(5), 464-596.—Among the reported contributions of the participants in this Gallaudet and Office of Vocational Rehabilitation conference on audiological, psychoeducational, and vocational aspects of deafness, the most relevant are: "Audiometric Evaluation and Its Relation to Habilitation and Rehabilitation" (D. Robert Frisina); "Special Audiometric Tests: Their Educational Significance" (Robert Goldstein); "Auditory Training" (Shirley P. Stein); "Lipreading" (Shirley A. Cranwill); "Methods of Communication in Teaching the Deaf" (Powrie V. Doctor); "Special Curriculum Needs of the Deaf-Primary Level" (Marjorie E. Magner), secondary level (Edward L. Scouten), and college level (George E. Detmold); "Differential Educational Needs in the Habilitation and Rehabilitation of the Deaf" (Margaret S. Kent); "Psychological Considerations in Early Profound Deafness" (Edna S.

Levine); "Problems Encountered by Parents of Deaf Children" (Robert D. Adams); "Psychiatric Considerations in the School Age Deaf and Psychiatric Considerations in the Adult Deaf" (Kenneth Z. Altshuler); "Counseling Needs and Services for the Adult Deaf" (Howard L. Roy); "Vocational Guidance for the Adult Deaf" (Richard M. Phillips); "Religious Guidance for the Deaf" (Douglas Slasor); "Occupational Status of the Deaf" (Stanley K. Bigman); "The Adult Deaf in Professions" (Alan B. Crammatte); and a section of brief reports on "Organizations: National Efforts Related to Deafness."—*T. E. Newland*.

6977. **Kowalsky, Majorie H.** (Coll. St. Catherine, St. Paul, Minn.) **Integration of a severely hard of hearing child in a normal first-grade program: A case study.** *J. speech hear. Disord.*, 1962, 27(4), 349-358.—Report of a case of a child with a hearing loss of 87 db. in the better ear who was enrolled in a district school and followed carefully throughout one year in order to define the problems attributable to the hearing loss and similar items. At the year's end her academic achievement was satisfactory, she was socially well-adjusted, and her communicative skills had improved significantly.—*M. F. Palmer*.

6978. **Lerea, L., & Yarden, P.** (Noise Control Inst., Tel Hashomer) **Havhanat likuyey shemia etsel yeladim vetinokoto.** [Diagnosis of hearing defects among children and babies.] *Dap. refuim*, 1962, 21, 227-230.—Case histories; clinical observation; and ear, nose, and throat examinations are used for the diagnosis of hearing defects. The Picture-Sound Hearing Test, which measures the hearing threshold of 3-year-old children, is recommended. Instructions are given by pantomime. The stimuli used are of low, middle, and high frequency. (English & French summaries)—*H. Ormian*.

SPEECH DEFECTS

6979. **Carp, F. M.** (Trinity U.) **Psychosexual development of stutterers.** *J. proj. Tech.*, 1962, 26(4), 388-391.—Stutterers did not display any more anal retentiveness in the Blacky than did nonstutterers. Higher scores in castration anxiety (males) and penis envy (females) were found as predicted among stutterers. In general, higher oral erotic and oral sadistic scores were found among stutterers, and these results are consistent with psychoanalytic theory.—*A. F. Greenwald*.

6980. **Holland, Audrey L., & Matthews, Jack.** (Emerson Coll.) **Application of teaching machine concepts to speech pathology and audiology.** *ASHA*, 1963, 5(1), 474-482.—Development of experimental teaching machine programs for discrimination of the [s] phoneme. 4 programs were used with 27 children: 18 males and 9 females between the ages of 8 and 11 with a grade range of 2nd through the 5th grade. Program I based on Powers was the most successful. The authors come to the general conclusion that improvement of [s] discrimination in children is amenable to teaching machine programming.—*M. F. Palmer*.

6981. **Kanizsai, Dezsö.** **Afaziások terapiájának pszichológopédiája.** [Psychologopedics in therapy of aphasia.] *Magyar pszichol. Szle.*, 1961, 18(2), 163-172.—The basis of the psychologopedic therapy

is the complete understanding of the cortical insult. The therapist has to assess the lacking or transformed brain mechanics and the influence that somatic, psychological, and intellectual symptoms have on each other. The collapsed world of the patient has to be rebuilt with the restoration of all faculties. Phonetics alone will not bring restored speech. Therefore, therapy is aimed at the renewing of the patient's mental and physical integrity which then brings about changes in the cortical organization and accelerates restitution.—*E. Friedman.*

6982. Klinger, Herbert. (VA Hosp., NYC) **Imitated English cleft palate speech in a normal Spanish speaking child.** *J. speech hear. Disord.*, 1962, 27(4), 379-381.—Report of a case who had an older brother with a cleft palate who imitated the English of his older brother with marked characteristics of cleft palate speech. In Spanish this boy replied without a trace of cleft palate speech. In order to avoid contact with the already established poor speech influence, the younger brother was kept away from the older one, the parents were advised to speak only English and asked to return for a checking. In a year and a half the case had forgotten how to speak Spanish, and his English was normal.—*M. F. Palmer.*

6983. Peters, Henry N. (VA Hosp., Jefferson Barracks, Mo.) **Interaction of delayed speech feedback, metalingual factors, and chronic schizophrenia.** *J. speech hear. Disord.*, 1962, 27(4), 359-367.—8 schizophrenics and 1 epileptic are compared with a group of 7 nonpatients. 2 13 word sentences were used plus a random arrangement of the words of each and 3 systematized vs. random arrangements of digits. 25-, 10-, 5-noun wordlists made a 3rd experiment. These Ss were then studied for the effect of such material on speech when reading on delayed feedback. There seems to be a positive relationship between systematization of such material and the disrupting effect of such feedback with this relationship being much more marked in the schizophrenic group.—*M. F. Palmer.*

6984. Wingate, M. E. (U. Washington) **Evaluation and stuttering: III. Identification of stuttering and the use of a label.** *J. speech hear. Disord.*, 1962, 27(4), 368-377.—Review of the literature concerning the identification of stuttering and the use of labels. This is the final article of a series of 3 which tend to show that the bulk of research in 3 areas of (a) speech characteristics of young children, (b) conditions of stress in the backgrounds of stutterers, and (c) critical evaluation of speech is either equivocal or contradictory to the evaluation theory as a general explanation of stuttering.—*M. F. Palmer.*

6985. Wyatt, Gertrud L., & Herzan, Helen M. **Therapy with stuttering children and their mothers.** *Amer. J. Orthopsychiat.*, 1962, 32(4), 645-659.—It is believed that the stuttering child has had a crucial disruption of the primary feedback circuit between mother and child which results in aggression-anxiety and that the mother of a stutterer suffers feelings of helplessness and anger. Therapy with the child consists in age-appropriate teaching of patterns of communication, and with the mother, consists in explanation of how she is involved in the child's communication disorder. Both have to undergo a learn-

ing experience. A pilot study shows marked improvement, or a return to normal speech within treatment periods ranging from 4 to 12 months, for 10 out of 12 children under 7 years of age and 5 out of 8 over 7 years of age.—*R. E. Perl.*

NEUROLOGICAL DISORDERS

6986. Hagberg, Bengt. (University Hosp., Uppsala, Sweden) **The sequelae of spontaneously arrested infantile hydrocephalus.** *Develpm. Med. child Neurol.*, 1962, 4(6), 583-587.—In the cases of 26 apparently normal children and adults, "many" had been late in motor and mental development (especially in the early years), signs of ataxia were present in 12, squint was present in 11, Terman-Merrill test results showed more than expected falling in the 70-90 IQ range, and "behavior deviations were common especially in the lower IQ groups and in children with neurological abnormalities."—*T. E. Newland.*

6987. Johnson, Laverne C., Davidoff, Robert A., & Mann, Stuart H. **Brain activity, seizure discharges and behavior.** In San Diego Symposium for Biomedical Engineering, *Proceedings*. La Jolla, Calif.: SDSBE, 1962. Pp. 233-244.—"As part of a continuing study of the relationship between paroxysmal EEG activity and behavior, data from 24 patients have been presented. Of primary interest were the possible changes in autonomic activity during paroxysmal activity and the effect of paroxysmal activity on motor and cognitive performance. During subclinical paroxysmal activity there was no change in autonomic activity and in most patients no impairment in functioning. Clinical discharges were associated with autonomic changes and with impairment in one or more tasks. In petit mal patients, of particular interest was the drop in skin resistance after the cessation of the discharge even though other autonomic changes occurred during the discharge."—*C. T. Morgan.*

6988. Jones, I. Pierce. (Royal Perth Hosp., Western Australia) **Psychomotor epilepsy.** *Develpm. Med. child Neurol.*, 1962, 4(6), 612-619.—"In nearly 80% of cases, psychomotor seizures are associated with epileptogenic foci in the temporal lobes, but in the remainder the focus is in other cortical areas (frontal or Sylvian)." The underlying lesion, psychological accompaniments, and diagnosis are discussed. "By use of thiopental-sleep activation and sphenoidal electrodes a positive diagnosis has been obtained in 95% of cases."—*T. E. Newland.*

6989. Knehr, Charles A. (Cornell U. Medical Cent.) **Differential impairment in multiple sclerosis.** *J. Psychol.*, 1962, 54(2), 443-451.—The performances of controls, multiple sclerotics, and non-MS patients with cerebral damage were compared on the same battery of tests. The multiple sclerotics showed a significant preservation of general intellectual ability compared to other organics while showing equal or greater impairment in the remaining functions measured.—*Author abstract.*

Brain Damage

6990. Allison, R. S. (Royal Victoria Hosp., Belfast, Ireland) **The senile brain: A clinical study.** Baltimore, Md.: Williams & Wilkins, 1962. vi, 288 p. \$10.00.—". . . in the cortical realm of function the

views held by protagonists of the old schools are being criticized by the experimental psychologist, who seeks to delineate some factor or factors in brain injured persons which may influence and determine the varied disturbances of intellectual function shown by them. It is for these reasons that the aim has been to make the book primarily descriptive and to concentrate on details of clinical observations made in individual cases." The clinical materials were 198 patients, ages below 40 to over 70, who showed "impairment of memory and intellect" and "persistent signs of mental disorder." Topics covered include general physical examination, neurological examination, organic mental testing, acute disturbances of consciousness, chronic amnesic syndromes, disorders of speech and language, disorientation, apraxia and agnosia, and differential diagnosis and treatment. (300 ref.)—*D. T. Herman.*

6991. Bechtoldt, H. P., Benton, A. L., & Fogel, M. L. (U. Iowa) An application of factor analysis in neuropsychology. *Psychol. Rec.*, 1962, 12, 147-156.—An exploratory attempt to develop explicitly and empirically defined behavioral concepts for evaluating the relationship between cerebral disease and performance deficits. 100 patients given 18 tests, "defects in which have been related on clinical observational grounds to disease of the parietal and occipital lobes in man." Results of a modified centroid analysis (graphic rotation) yielded 5 factors. Coupled with subsequent multiple regression analysis, these techniques resulted in the selection of 6 variables which "appear to be a useful set for further empirical work."—*R. J. Seidel.*

6992. Benton, A. L., Sutton, S., Kennedy, J. A., & Brokaw, J. R. (State U. Iowa) The crossmodal retardation in reaction time of patients with cerebral disease. *J. nerv. ment. Dis.*, 1962, 135(5), 413-418.—With serial presentation of stimuli, will brain damaged patients show changes in simple reaction time as a function of changes in the stimulus, and, if so, will these changes differ from those shown by non-cerebral-damaged Ss? It was found that "both patients with cerebral disease and schizophrenic patients show excessive susceptibility to the cross-modal [sensory] retardation effect in simple high speed performance tasks."—*N. H. Pronko.*

6993. Fantalova, V. L. (USSR Acad. Medical Sciences, Moscow) Nekotorye osobennosti tehnii sledovykh reaktsii v sfere zritel'nogo analizatora pri lokal'nykh porazheniiakh zatylochnoi doli bol'shikh polusharii cheloveka. [Some features of the course of trace reactions in the sphere of the visual analyzer of patients with local lesions in the occipital lobe.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(6), 1034-1041.—During the elaboration of motor CRs to optic stimuli with verbal reinforcement, intensive visual afterimages ("pathological after-images") were observed in 9 out of 25 patients. The afterimages are usually of a light-blue, dark-blue, or grey color, appear in a wave-like manner, and are so intense that S perceives them as real. Conditioned connections can be formed between afterimages and movement. These afterimages are explained as Purkinje afterimages distorted and intensified due to the action of the pathological focus on the occipital visual area.—*A. Cuk.*

6994. Joynt, R. J., Benton, A. L., & Fogel, M. L. (U. Iowa) Behavioral and pathological correlates of motor impersistence. *Neurology*, 1962, 12(12),

876-881.—Motor impersistence (MI) denotes inability of some brain-damaged individuals to sustain certain voluntary motor acts. It "is rather specifically associated with lesions of the nondominant hemisphere and might be due to cortical involvement." The authors first determined what degree of MI existed in a sample of control patients and utilizing these norms, ascertained the incidence of excessive MI in brain-damaged patients. The results of psychological testing were "correlated with the history, neurological examination, and pathologic findings in an effort to determine the clinical significance and essential nature of the phenomenon of MI. . . . our findings indicate that it would be wise to assign a specific localizing value to MI on the basis of the data now available. The phenomenon is perhaps best classified as still another example of the oscillation in level of function which is so frequently shown by patients with cerebral disease, and which may be expressed in diverse forms such as short attention span, emotional lability, and fluctuation of sensory thresholds."—*R. Gunter.*

6995. Kinsbourne, M., & Warrington, Elizabeth K. (National Hosp., Queen Square, London, England) A variety of reading disability associated with right hemisphere lesions. *J. Neurol. Neurosurg. Psychiat.*, 1962, 25(4), 339-344.—"Six right-handed patients with right (minor) hemisphere disease and reading disability were shown to make paralexical errors predominantly limited to the beginning of the word. They made similar errors when confronted with letter groups or words presented tachistoscopically in the intact right half field. The reading disability, unassociated with dysphasia and dysgraphia, was the result of an abnormality of perception, not only of words but also of other visual forms. This abnormality was determined by an abnormal distribution of visual attention. Its presence provided evidence of neglect of the left side of space and thus of a right parietal lesion." (21 ref.)—*M. L. Simmel.*

6996. Pevzner, S., Bornstein, B., & Loewenthal, M. (Municipal Hosp., Tel-Aviv, Israel) Prosopagnosia. *J. Neurol. Neurosurg. Psychiat.*, 1962, 25(4), 336-338.—Brief recapitulation of previously published (see 34: 6452) clinical findings in a 64-year-old patient with prosopagnosia, topographical disorientation, simultanagnosia, achromatopsia, and left homonymous hemianopsia. In the succeeding 4 years most of the symptoms gradually disappeared, leaving only the prosopagnosia and a left upper quadrant scotoma. As originally predicted, necropsy demonstrated 2 lesions, one in the region of the left angular gyrus and another at the lower lip of the right calcarine fissure.—*M. L. Simmel.*

6997. Pollack, Cecelia. (Levittown, N. Y.) Sleep-learning as an aid in teaching reading to a brain-injured boy. *J. ment. Defic. Res.*, 1962, 6(2), 101-107.—"This study was designed to test whether sleep-learning could be productive as a supplement to conscious learning in teaching a brain-injured boy . . . the blending of short vowel sounds into words. . . . The results of the study indicate that learning of auditory material does occur during partial sleep."—*A. Barclay.*

Cerebral Palsy

6999. Skatvedt, Marit. **Cerebral palsy in Norway.** *Develpm. Med. child Neurol.*, 1962, 4(6), 663-664.—Presented briefly are the service developments for children which started in 1951. The present 12 residential treatment homes, 4 outpatient centers, and 10-15 other hospital and treatment centers provide services so that all such children who need them can get them. "The cost of such treatment is met by the State Health Insurance system."—T. E. Newland.

7000. Twitchell, Tomas E., & Ehrenreich, Donald L. **The plantar response in infantile cerebral palsy.** *Develpm. Med. child Neurol.*, 1962, 4(6), 602-611.—In such patients, "the plantar response as generally elicited (e.g., by key drag) may yield seemingly paradoxical results and its interpretation may be difficult." The possible ambiguities and confusions in diagnosis and neurological implications are discussed.—T. E. Newland.

7001. Yanagi, Garret Honoru. (U. Tennessee) **An appraisal of psychologic deficit in children with cerebral palsy.** *Dissert. Abstr.*, 1962, 22(11), 4088-4089.—Abstract.

MENTAL RETARDATION

7002. Appell, M. J., Williams, C. M., & Fishell, K. N. **Significant factors in placing mental retardates from a workshop situation.** *Personnel Guid. J.*, 1962, 41(3), 260-265.—Using a Work Evaluation Report (WER), an attempt was made to distinguish between retardates considered long-term trainees in a workshop and those who have achieved competitive employment after exposure to a workshop. On the WER, 16 items were found significantly higher for the long-term group. Time in workshop and Wechsler nonverbal scores further distinguished the employed from the long-term group. Workshop goals and purposes should be studied.—S. Kavruck.

7003. Appleton, M. D., & Pritham, G. H. (Pennsylvania State U.) **Biochemical studies in mongolism: II. The influence of age and sex on the plasma proteins.** *Amer. J. ment. Defic.*, 1963, 67(4), 521-525.—This paper, following upon the previous one by the same authors (see 37: 7024), explores age and sex differences. The findings reported are as follows: (a) No significant differences exist between the sexes within or between the mongoloid and control samples for any of the protein fractions studied. (b) Total protein values show no variation for sex and age when the samples are compared either within or between groups. (c) There is a definite tendency for the concentrations of albumin to decrease and of gamma-globulin to increase with increasing age. The most significant results are the persistently high concentrations of gamma-globulin and the low concentrations of albumin in mongoloids. (d) Significant differences in the relative percentages of albumin, alpha₁- and alpha₂-globulins, and the albumin/globulin ratio, as well as the mobilities of the gamma-globulin fractions, were found between the total mongoloid and control samples and between corresponding age groups within each sample.—V. S. Sexton.

7004. Barsch, Ray H. (Jewish Vocational Service, Milwaukee) **Learning disorders of handicapped children.** *J. Rehabil.*, 1962, 28(5), 10-12.—The processing mode hierarchy is the concept used

in analyzing the factors involved in the learning disorders of handicapped children. This analysis is focussed upon the child's visual, auditory, kinesthetic, motor, and tactual deficits which contribute to his underachievement in learning. These factors are considered from the standpoint of the total learning demand and provide a basis for determining the hierarchical relationship of these capacities and the nature of the etiological sources of deficit involved. This process is a systematic way of analysis and points the way to needed corrective procedures applicable to the specific child.—M. A. Seidenfeld.

7005. Baumeister, Alfred A. (George Peabody Coll. Teachers) **The dimensions of abilities in retardates as measured by the Wechsler Intelligence Scale for Children.** *Dissert. Abstr.*, 1962, 22(9), 3270.—

7006. Beolchini, P. E., Bencini Bariatti, A., & Morganti, G. **Indagini genetico-statistiche sulle fratrie di 432 soggetti mongoloidi.** [Genetic and statistical surveys on the sibships of 432 mongol propoiti.] *Acta genet. med. gemellolog.*, Rome, 1962, 11(4), 430-449.—A statistical analysis has been made on the clinico-anamnestic information concerning 432 mongol propoiti, taking into particular consideration the age of parents, the order of birth, and the reproductive features observed in the families of the propoiti. The authors furthermore examine the possibility of making an eugenical counseling concerning the probability of a new occurrence of the syndrome.—*Journal abstract.*

7007. Blackman, L. S., & Holden, E. A. (Edward R. Johnstone Training & Research Cent., Bordentown, N. J.) **Support vs. non-support in an autoinstructional word program for educable retardates.** *Amer. J. ment. Defic.*, 1963, 67(4), 592-600.—2 equated groups of educable, nonreading, retarded adolescents were compared in their performance on a Support (prompting) and a Non-Support (confirmation) program designed to teach 4 words. The number of responses required to complete 16 test frames, the number of these 4 words successfully read from cards immediately after training, and the number of words successfully read 24 hours after training were the dependent variables. An automated self-instructional device was the means of program presentation. No differences were reliable, although learning resulted and differences between the 2 groups were consistently in the direction of better performance under the Support program. The hypothesized inverse relationship between IQ and number of responses required to complete the program, with this inverse relationship greater for the Non-Support than the Support program appeared but was not significant. As expected, there was no significant difference between the mean number of responses on the various full support, reduced support, and test frame categories of the Support program. Significant differences were obtained between analogous categories of the Non-Support program.—V. S. Sexton.

7008. Castets, Bruno, Lefort, R., & Reyns, M. (Cent. Psychiatric Infantile, Rue Albert-de-Mun, Armentières) **Note critique sur la notion d'arriération mentale et quelques notion connexes.** [Critical note concerning mental retardation and connected phenomena.] *Evolut. psychiat.*, 1962, 27(3), 379-391.—A survey of the literature indicates

that mental retardation is not attributable to neurological lesions. "On the other hand, experience in our department has shown us that a simple change of organisation or of atmosphere has led to a considerable improvement in the behaviour of children thought to be ineducable and semi-educable imbeciles. Thus out of 50 children deemed imbeciles it was possible to teach 48 of them satisfactorily. These elements along with the relationship of clinical symptomatology of the states known as mental backwardness and of numerous psychotic states in the child lead us to put forward the hypothesis of a psychogenesis of mental backwardness which, in the great majority of cases would appear as the expression of a psychotic structure."—*L. A. Osilund.*

7009. Clark, E. T. (St. John's U.) Sex role preference in mentally retarded children. *Amer. J. ment. Defic.*, 1963, 67(4), 606-610.—A projective test of sex role preferences, the It Scale for Children, was administered to 66 male and 50 female retardates enrolled in educable and trainable public school classes. "Significant differences were found between the sex role preferences of male and female Ss. Masculine sex role preferences in both male and female Ss are most highly correlated with M.A. No exclusively feminine patterns of sex role preferences were found in either male or female Ss, but exclusive male patterns of sex role preferences are found in both male and female retardates."—*V. S. Sexton.*

7010. Cochran, Irene L., & Cleland, C. C. (Abilene State School, Tex.) Manifest anxiety of retardates and normals matched as to academic achievement. *Amer. J. ment. Defic.*, 1963, 67(4), 539-542.—This study employing a small sample of retarded Ss supports the hypothesis that retarded 4th-grade Ss have more manifest anxiety than normals achieving academically at the same level and more than normal Ss of their own chronological age. According to the CMA Scale Lie scale, retarded and normal 4th graders tend to lie significantly more than normal teenagers.—*V. S. Sexton.*

7011. Dentler, Robert A., & Mackler, Bernard. (U. Kansas) Mental ability and sociometric status among retarded children. *Psychol. Bull.*, 1962, 59(4), 273-283.—"A review of representative studies of the relation between ability and sociometric status among normal children, institutional retarded children, and noninstitutional retarded children, indicated high agreement with the generalization that individual ability is positively and significantly associated with choice status. . . . Studies that attend exclusively to the relation between intelligence and status should be avoided, while efforts to predict status within groups undergoing formation or change should be increased."—*W. J. Meyer.*

7012. Ellis, N. R., Hawkins, W. F., Pryer, Margaret W., & Jones, R. W. (George Peabody Coll. Teachers) Distraction effects in oddity learning by normal and mentally defective humans. *Amer. J. ment. Defic.*, 1963, 67(4), 576-583.—To test the effects of 2 types of distraction upon oddity learning by normal and mentally defective Ss of MAs 6, 7, and 8, 288 Ss were assigned to a design consisting of 24 cells. The latter derived from the 6 normal and defective groups studied under 4 conditions. In 1 condition Ss performed before a large mirror in which they observed their own movements. A black

cloth covered the mirror for a control group for this treatment. A 2nd treatment involved the attention value of the stimulus objects. 10 with high distracting value and 10 with low were used. The central hypothesis, that the defective S would be more adversely affected by distraction than the normal, was not confirmed.—*V. S. Sexton.*

7013. Gage, Ruth M., & Wolfson, I. N. (Letchworth Village, Thiells, N. Y.) Four years of experience with day work program at Letchworth Village. *Amer. J. ment. Defic.*, 1963, 67(4), 563-568.—A review of the day work program established at Letchworth Village in 1957 to give patients part-time work experience before permanent placement out of the institution is presented. After a 4 year period the follow-up indicates that 376 patients have taken part. Of these, 189 were placed out of permanent work placement under supervision of the social service department or were returned to their families. 111 patients in the program had IQs from 41 to 50. 110 resided in the institution from 21 to 40 years and 83 were 41 years of age or older. Of the 189 who were placed in the community, 44 had IQs from 41 to 50, 52 resided in the institution from 21 to 40 years, and 37 were 41 years of age or older. Those returned to their families were somewhat younger and lived in the institution for shorter periods than those placed in employment under social service department supervision. All of the 13 patients who escaped from the program were under 23 years of age.—*V. S. Sexton.*

7014. Girardeau, F. L., & Spradlin, J. E. (U. Kansas) Gestural cues in discrimination learning by retarded children. *Amer. J. ment. Defic.*, 1963, 67(4), 584-588.—36 mental retardates in 3 groups of 12 were given a spatial successive discrimination learning task in which the cue for solution was either the color of the background, a gesture by the E, or a combination of these 2 cues. All were given 500 trials during a 10-day period. Performance was rated in terms of change in performance over the 500 trials. For the 3 groups there was a significant increase in correct responses. No significant differences were found among the groups and there was no significant interaction between trial blocks and groups. A retention test of 50 trials was run 3 months later. Over the 3-month interval, retention was nearly perfect, with no significant differences among the groups in retention performance.—*V. S. Sexton.*

7015. Gorlow, L., Butler, A., & Guthrie, G. M. (Pennsylvania State U.) Correlates of self-attitudes of retardates. *Amer. J. ment. Defic.*, 1963, 67(4), 549-555.—164 institutionalized female retardates were administered the Laurelton Self-Attitude Scale. Scores on the subtests of this scale were correlated with several measures in the areas of achievement early experience, and personality. Small but significant positive relationships were found between self-acceptance and measures of intelligence, school achievement, success in the institutional training program, and success on parole. The authors affirm that the finding that retardates who were separated from their parents at an early age express more negative self-attitudes is congruent with the expectation that self-attitudes are formulated at an early age and are influenced by family stability. Self-acceptance also was observed to be associated with certain dimensions of social needs and certain modes of response

to hostility. Those expressing high degrees of self-acceptance tend to express less need for the support of others and to accept their own hostility.—V. S. Sexton.

7016. Guskin, S. L. (George Peabody Coll. Teachers) **Measuring the strength of the stereotype of the mental defective.** *Amer. J. ment. Defic.*, 1963, 67(4), 569-575.—The "strength" of the stereotype of the mental defective was studied on 2 different samples and with 2 different measurement procedures. Employing a more traditional methodology, the author asked the Ss to rate the qualities of an average 18-year-old boy and also one who had been in a training school for the retarded. Those adjectives which most clearly differentiated between the 2 sets of ratings were regarded as the stereotype of defective and the degree of agreement among the Ss in attributing these traits to the defective was termed the "strength" of the stereotype. In the 2nd method the same Ss were presented with typewritten sketches of 2 "persons" and the Ss were asked to rate these persons on a set of traits. For $\frac{1}{2}$ of the Ss the critical group membership information was included within one of the sketches and for the other $\frac{1}{2}$ within the other sketch. The Ss were 40 college students responding to a questionnaire and 50 persons of different social and educational background who were interviewed. There was agreement in both samples on attributed assigned to defectives and little difference between samples in nature of ratings. The consensus indicated considerable stereotype "strength." This is seen to agree with other studies in the fact that stereotypes are not indiscriminate in their effects upon judgment.—V. S. Sexton.

7017. Guthrie, G. M., Butler, A., & Gorlow, L. (Pennsylvania State U.) **Personality differences between institutionalized and non-institutionalized retardates.** *Amer. J. ment. Defic.*, 1963, 67(4), 543-548.—3 inventories were administered to female Ss in an institution and to groups of retardates who were still at home. The groups were matched on IQ and age and were comparable with respect to socioeconomic background. The authors conclude that girls who have been placed in an institution have a much more negative set of self-attitudes than those who remain in their homes. They see themselves as of less value and as more dominated by their own needs. The institutionalized are less able to acknowledge angry feelings in the face of frustration than are those who have succeeded in the community. Some evidence is presented which indicates that these reactions are not the result of the loss of freedom. According to the investigators, it is probable that these attitudes play a significant role in the failure of these girls to adjust to society's demands.—V. S. Sexton.

7018. Kaufman, M. E. (U. Wisconsin Medical School, Madison) **The formation of a learning set in institutionalized and noninstitutionalized mental defectives.** *Amer. J. ment. Defic.*, 1963, 67(4), 601-605.—96 object-quality discrimination learning problems were presented to 2 matched groups of 14 cultural-familial mentally retarded children, ranging in age from 9.3 to 16.9. The experimental group consisted of institutionalized Ss and the controls lived with their families in marginal community dwellings. During 12 experimental days and after 96 problems, the home group had a higher mean number of correct

responses than the institution group and these differences were significant. All the Ss in the community showed significant amounts of learning after 96 problems, whereas $\frac{1}{2}$ of the institution group still functioned at chance level. Chronological age had a significant influence on initial learning scores. The older retarded children made more correct responses during the early phase of the experiment. As learning continued, both younger and older children living at home learned more rapidly than institutional Ss. The younger institutional children were most adversely affected, giving the poorest performance of any group within the study.—V. S. Sexton.

7019. McKinney, J. P., & Keele, Tina. (Columbus State School) **Effects of increased mothering on the behavior of severely retarded boys.** *Amer. J. ment. Defic.*, 1963, 67(4), 556-562.—Previous investigations of maternal deprivation have been inconsistent in their conclusions concerning the behavioral effect in children. This study reevaluated the independent variable of mothering and its effects in the light of more recent studies of sensory deprivation in animals. This research differs from the previous in its emphasis on the sensory aspects of mothering as well as in its multidimensional approach to the dependent variable of behavioral change in the child. 24 severely retarded boys were the Ss. Mothering was defined as increased physical attention, given by a group of older, mildly retarded women. Behavior changes in the boys were measured in terms of scores on 8 orthogonal factors known to be relevant to this sample. Significant improvement in 4 of these factors was found for the experimental group when compared to a matched control group. Most significant changes were in purposive behavior and language communication.—V. S. Sexton.

7020. McKinney, John Paul. (Montreal Children's Hosp., Canada) **A multidimensional study of the behavior of severely retarded boys.** *Child Developm.*, 1962, 33(4), 923-938.—The time-sampling observations of 48 severely retarded boys were factor analyzed in an effort to discover the independent dimensions relevant to a description of the group. 13 independent behavioral factors emerged of which 8 appeared to be group factors and accounted for better than 50% of the variance. The 8 factors are: Purposefulness, Lack of Restraint, Self (Bodily) stimulation, Age, Social Interaction, Neuromuscular Control, Verbal, and Emotional Maladjustment. Studies suggested by theoretical interpretations of the various factors are presented.—W. J. Meyer.

7023. Pevzner, M. S. **Oligophrenia: Mental deficiency in children.** New York: Consultants Bureau, 1961. xiii, 406 p. \$15.00.—The author, senior psychiatrist in the Moscow Institute of Defectology, presents a discussion of the findings of Soviet clinical investigations of retarded children. The work is concerned with identifying the behavioral manifestations

and concomitant physiological substrates which characterize the mental retardate. A theory engendered by these investigations is offered, and implications are drawn for conceptualizing the nature of the psychological deficit arising from retarded mental development. (232 ref.)—*A. Barclay.*

7024. Pritham, G. H., Appleton, M.D., & Fluck, E. R. (Pennsylvania State U.) **Biochemical studies in mongolism: I. The influence of environment on the concentration and mobilities of plasma proteins.** *Amer. J. ment. Defic.*, 1963, 67 (4), 517-520.—Concentrations and mobilities of albumin; α_1 , α_2 , β , and gamma-globulins; and of fibrinogen were determined in the blood of institutionalized and noninstitutionalized mongoloids, institutionalized nonmongoloid retardates, and normal controls. Statistical analysis revealed that institutionalized mongoloids have significantly higher concentrations of gamma-globulin, significantly lower concentrations of albumin, and significantly lower mobilities of gamma-globulin than either the normal controls or the institutionalized nonmongoloid retardates, but that these parameters are not significantly different for the noninstitutionalized mongoloids. It is indicated that the institutional environment induces significant aberrations in the concentrations of certain plasma proteins. Highly significant or significant differences for albumin/globulin ratios and for the concentrations of α_2 -globulin were found when institutionalized mongoloids were compared with the normal controls or with the institutionalized nonmongoloid retardates. In general, differences among all 4 groups were not significant for the concentrations or mobilities of other plasma proteins.—*V. S. Sexton.*

7025. Ring, Elizabeth Jane McLaughlin. (U. Minnesota) **The relationship of paired-associate learning and retention in retarded and normal children to length of anticipation interval and selected ability measures.** *Dissert. Abstr.*, 1962, 22 (11), 4100.—*Abstract.*

7026. Silverstein, A. B., Fisher, G. M., & Owens, E. P. (Pacific State Hosp., Pomona, Calif.) **The altitude quotient as an index of intellectual potential: III. Three studies of predictive validity.** *Amer. J. ment. Defic.*, 1963, 67 (4), 611-616.—3 studies were done to test the predictive validity of the altitude quotient (AQ). They were concerned with the prediction of the IQ of retardates after hospitalization, the prediction of their release from the hospital, and the differentiation of retardates from pseudo-retardates. The results of the 3 studies were similar: (a) both AQ and IQ were valid predictors, although IQ tended to have greater predictive validity; (b) the validity of the optimally weighted combination of the 2 measures was about the same as the validity of IQ alone; and (c) AQ, independent of IQ, was no longer a valid predictor, whereas IQ, independent of AQ, still possessed predictive validity. The authors note that the 3 studies were interrelated and so the negative findings with respect to AQ do not have the same weight as would the results of 3 independent studies. They feel that their results raise the fundamental question of whether AQ is measuring anything at all that is not measured by IQ.—*V. S. Sexton.*

Retardation. **Mental retardation: Activities of the U. S. Department of Health, Education and Welfare.** Washington, D. C.: USDHEW, CMR, 1962. viii, 77 p. \$.50.

BEHAVIOR PROBLEMS

7028. Bier, William C. (Ed.) **Problems in addiction: Alcoholism and narcotics.** New York: Fordham Univer. Press, 1962. 247 p. \$.50.—Proceedings of the Institute on Pastoral Psychology held at Fordham University in June 1959. The following topics are reviewed: the extent of the problem (Yvelin Gardner, R. J. Campbell, Raymond H. H. Kennedy, Ruth Fox, Christopher Sower, Joseph Hirsh, & Eva Rosenfeld); viewpoints typical of concerned professional groups, such as the church (John C. Ford & Norman C. Eddy), the police (Arthur M. Grennan), medicine (Kenneth W. Chapman), and the law (John M. Murtagh); and advances in treatment (Adele C. Streeseman, Frederick Lawrence, Herbert Berger, Rafael R. Gamso, Leon Brill, & John J. Pasciutti). Attitudes toward these behavioral deviations change most slowly, but therapy and education rather than penal approaches are helping provide new solutions.—*W. L. Wilkins.*

7029. Hauck, A. **Beitrag zur Psychoendokrinologie des Masochismus.** [Contribution to the psychoendocrinology of masochism.] *Acta psychosom. psychosom.*, Basel, 1962, 10 (4), 265-279.—In a 60-year-old male, masochism is shown to be a complex interaction of heredity, constitution, disposition, and exogenous and psychological factors. The infantile-feminine habitus, and deficient androgen and excess estrogen metabolism suggest a secondary pituitary hypogonadism. Without normal development, fixation occurred in the polymorph perverse stage.—*G. Rubin-Rabson.*

7030. Reger, R. (Wayne County Training School, Northville, Mich.) **Eye-hand coordination, peer acceptance and emotional disturbance.** *Amer. J. ment. Defic.*, 1963, 67 (4), 589-591.—25 boys from a special unit of the Wayne County Training School were ranked on several characteristics. No significant relationship was found between sociometric peer rankings and eye-hand coordination. Between peer rankings and rankings on degree of emotional disturbance there was a positive relationship. Those accepted by their peers tended to be considered less disturbed while isolated children tended to be considered as more disturbed.—*V. S. Sexton.*

7031. Reik, Theodor. **Masochism in sex and society.** New York: Grove, 1962. vi, 439 p. \$.95 (paper).—A pocketbook edition, originally published in 1941 as *Masochism in Modern Man*.—*E. Borrowman.*

7032. Sharma, P. N. **A study of detection and treatment of behavior disorders in children.** *Indian J. soc. Wk.*, 1962, 23 (1), 25-29.—A plan for forming a table of behavior norms to distinguish the divergent from the normal is discussed. So far the study has been confined to children from a locality which has slum houses and mainly comprises the low income group.—*R. Schaeff.*

Alcoholism

7033. Almeida, Manuel. **Investigación clínica sobre la evolución del alcoholismo.** [Clinical in-

vestigation on the evolution of alcoholism.] *Rev. Neuro-Psiquiat.*, 1962, 25(1), 98-123.—A study of the development of alcoholism in 181 patients of the Anti-alcoholic Dispensary in Lima, Peru. The frequency and age of onset of different symptoms are considered, taking Jellinek's nomenclature as a frame of reference. In this sample of patients, alcoholism starts around the age of 25; loss of control occurs about age 28; between the ages of 31 and 33 there emerge such manifestations as abstinence and withdrawal symptoms, blackout, etc.; between 34 and 35 tolerance decreases. The author also presents a study of 763 cases of alcoholic psychosis and finds that the psychosis appears at the average age of 43. The findings are compared with those of other studies of alcoholism.—*R. M. Frumkin.*

7034. Clancy, John. (Psychopathic Hosp., Iowa City) Procrastination: A defense against sobriety. *Quart. J. Stud. Alcohol*, 1961, 22(2), 269-276.—The procrastination defense is described in terms of the drinker's decision to abstain from alcohol without setting a date. Denials, rationalizations, and projections permit him to justify further drinking and avoid the conflict of whether to drink or not to drink. The author is of the opinion that a determination of this procrastination defense and its supporting rationalization system should be made at the outset of psychotherapy; and if present, it should be dealt with before other areas of uncovering or reeducation are undertaken.—*D. E. Walton.*

[The bases of biochemical pathogenesis and treatment of acute alcoholic deliria.] *Encephale*, 1962, 51(4), 361-382.—Hydroelectrolytic disturbances, disturbances in energy metabolism, avitaminoses, intermediate metabolism, and parenchymatous shock (liver, kidney, heart, endocrines, and nervous system) are discussed in relation to delirium tremens. Therapeutic indications are considered for metabolic and drug interference.—*W. W. Meissner.*

Sex Deviation

7040. Fox, J. R. (Exeter U.) Sibling incest. *Brit. J. Sociol.*, 1962, 13(2), 128-150.—An exploration of hypotheses (as suggested by the theories of Westermarck and Freud) on incestuous behavior in siblings of the opposite sex. Central to these hypotheses is the factor of propinquity, that is, physical (bodily, tactile) interaction, during sexual immaturity, especially in terms of resultant motivations and associated sanctions. Intracultural evidence was used to test hypotheses. Incestuous behavior patterns in an Israeli Kibbutz and among the Chiricahua Apache, Tallensi, Trobriand Islanders, Pondo, Mountain Arapesh, and Tikopia are reviewed. The single resulting hypothesis is as follows: "The intensity of heterosexual attraction between co-socialized children after puberty is inversely proportionate to the intensity of heterosexual activity between them before puberty." It is suggested that this hypothesis supports the general thesis that the amount of propinquity between any close relatives is inversely related to the amount of incestuous behavior. Thus, father-daughter relations show the greatest actual occurrence and mother-son the least.—*R. M. Frumkin.*

7041. Krich, A. M. (Ed.) The homosexuals: As seen by themselves and 30 authorities. New York: Citadel, 1962. 342 p. \$1.95 (paper).—A paperback edition of a book originally published in 1954.

7042. McCord, William; McCord, Joan, & Verden, Paul. (Stanford U.) Family relationships and sexual deviance in lower class adolescents. *Int. J. soc. Psychiat.*, 1962, 8(3), 165-179.—The evidence suggests that adolescent sexual deviation results from a familial environment characterized by authoritarian punishment of heterosexual behavior and certain experiences which weaken the child's desire to adopt the masculine role (as it is represented in the father's example). Other variables in the child's en-

vironment direct the unique form of sexual deviation. Specifically, it appears that: (a) A feminine identification, homosexual in nature, occurs when a child's father is absent or a rejecting person forces the child to view masculinity as an unattractive role. (b) Sexual perversion, untinted by homosexuality, results when parental behavior intensifies the child's sexual conflicts and, thereby, his sexual drive. (c) Total repression of sexuality occurs when parents consistently punish the child's sexual urges.—*R. M. Frumkin.*

7043. Wiedeman, G. H. Survey of psychoanalytic literature on overt male homosexuality. *J. Amer. Psychoanal. Ass.*, 1962, 10(2), 386-409.—Before Freud homosexuality was mainly considered as constitutional. In 1905 Freud stated that the homosexual leaves the early strong mother fixation, identifies with mother, and then takes himself as his love object. In 1915 Freud discussed archaic mechanisms and aggressive impulses in homosexuality. Since that time structural concepts and ego psychology have been applied more and more to homosexuality, e.g., deficient neutralization of drives and libidinalization of certain defenses. More reports are needed on classification, transference, course, and results with homosexual patients. Psychoanalytic research is moving in the direction of increasing our understanding of homosexuality.—*D. Prager.*

Drug Addiction

7044. Chessick, Richard D., Loof, David H., & Price, Hazel G. (United States Public Health Hosp., Lexington, Ky.) The alcohol-narcotic addict. *Quart. J. Stud. Alcohol*, 1961, 22(2), 261-268.—Using interviews by a psychiatric team, 29 persons who changed from addictive drinking to narcotic addiction were compared with a control group matched for race, sex, and area of residence. The shift from alcohol to intravenous opiates was explained in these psychodynamics: "In general, there was a loss of psychic equilibrium due to the loss of a love object on whom they were dependent for 'mother love.' This led to an increase in aggressive fantasies which threw the psychic structure off balance by threatening the ego with disintegrating amounts of violent affect changed with magical omnipotent power. The shift . . . represented an additional regressive step when the patient was unable to gain stability through previous defenses, and warded off deep repression or paranoid psychosis."—*D. E. Walton.*

7045. Eldridge, William B. Narcotics and the law: A critique of the American experiment in narcotic drug control. New York: New York Univ. Press, 1962. xiv, 204 p. \$5.00.—This book is an evaluation of America's controversial program of narcotics control, a program based on the assumption that increasingly severe penalties constitute an adequate solution to the problem. The author finds that statistics are so unreliable that there is uncertainty in regard to the scope of the problem as well as the results of the program. Recommendations are made for modification of present practices entailing realignment of responsibilities between the professions involved. The appendix includes state penalties for narcotics violations.—*S. Yudin.*

7046. Lawton, M. Powell. (Norristown State Hosp.) Psychosocial aspects of cigarette smoking.

J. Hlth. hum. Behav., 1962, 3(3), 163-170.—The problems of why people smoke and why it is so difficult to stop smoking are highlighted by a summary of research. "Initiation of smoking is seen as largely a social and psychological phenomenon, mediated by the mechanisms of curiosity, imitation, identification, status striving, and rebellion. The continuance of habitual smoking on the other hand, is seen as an even more complex phenomenon." (26-item bibliogr.)—*L. A. Ostlund.*

7047. Maurer, D. W., & Vogel, V. H. Narcotics and narcotic addiction. (2nd ed.) Springfield, Ill.: Charles C Thomas, 1962. xii, 339 p. \$9.00.—Opiates and their synthetic equivalents, addicting nonopiate sedatives, and stimulant drugs are used by addicts, neither to induce sleep nor to reduce the need for it, but for the sense of euphoria and drug intoxication. No set of criteria can identify a narcotic addict on sight. Drug addiction is a symptom of disease rooted in social and economic conditions which tend to create dissatisfaction, unhappiness, conflict, tension, and strife in the minds and souls of human beings. The individual may consciously or unconsciously seek relief in neurosis, psychosis, or in drugs. The only permanent cure is psychiatric treatment; the surest prevention is widespread mental hygiene.—*S. M. Dominic.*

Suicide (& Homicide)

7048. Taragano, Fernando. Psicodinamismos del suicidio diurno y nocturno en el arterioescleroso cerebral. [The psychodynamics of day and night suicide in cerebral arteriosclerosis.] *Acta psiquiat. psicol. Argent.*, 1962, 8(1), 33-36.—Diurnal suicide is characterized by: (a) conscious intention of suicide; (b) serious psychotic process; (c) unconscious motivation of aggression directed toward internal persecuting objects, located within the mental space or in the body image; and (d) experience of profound internal division producing regression to levels of magical thinking, omnipotence, and a manic denial of death. Nocturnal suicides are characterized by: (a) no intention of suicide without flight, (b) less serious psychosis manifested in confuso-oniric states, and (c) the suicide itself should be considered more accurately as an accidental complication. The possibility of mixed syndromes is discussed.—*W. W. Meissner.*

CRIME & DELINQUENCY

7049. Duffy, Clinton T., & Hirshberg, Al. 88 men and 2 women. Garden City, N. Y.: Doubleday, 1962. 258 p. \$4.50.—The experiences of the senior author, who presided over many executions while warden of San Quentin Prison. A vigorous attack on the institution of capital punishment is made.—*H. M. Cohen.*

7050. Henrikson, Lars V. (Augusta State Hosp., Me.) Risk-taking and the behavior disorders. *Correct. Psychiat. J. soc. Ther.*, 1962, 8(3), 133-143.—Criminal and immoral behavior is viewed as part of a pattern of compulsive gambling, i.e., a pattern of self-exposure to unnecessary risk and ultimate loss. The author concludes that for the compulsive gambler, the unsuccessful habitual criminal, and the chronic emotionally ill, behavior is directed toward the unconscious objective of losing. (21 Ref.)—*L. R. Witt.*

7051. Herbert, W. L., & Jarvis, F. V. **Dealing with delinquents.** New York: Emerson, 1962. 208 p. \$3.75.—Treatment of the delinquent in his own home environment is considered from the viewpoint of the social worker in relation to the feelings of the delinquent (juvenile or adult), his family, and society. Delinquency is a symptom of emotional disturbance, and hence is to be treated primarily by relationship therapy. The emotional interactions of the social worker, parents, and society are dealt with in detail. Techniques of interviewing, recording, and home visiting are handled in a practical manner. Work with the delinquent is seen as challenging, difficult, and not always rewarding.—S. M. Dominic.

7052. Lewicki, Andrzej. **Psychologiczna problematyka resocjalizacji więźniów.** [Psychological problems in the resocialization of prisoners.] *Psychol. wych.*, 1962, 5(3), 290-305.—The main problem confronting prison psychologists is one of appropriate diagnostic procedures. The lack of an adequate "scale of socialization" hampers the appraisal of the degree of progress being made in the rehabilitation of a prisoner. Politeness, kindness, and helpfulness are key factors in resocializing a prisoner.—H. Kaczkowski.

7053. Mizushima, Keiichi, & Jenkins, Richard L. (Tokyo Child Guidance Clinic) **Treatment needs corresponding to varieties of delinquents.** *Int. J. soc. Psychiat.*, 1962, 8(2), 91-103.—This study of juvenile delinquents in Tokyo suggests that: (a) psychopathic traits, identification with delinquency and crime, and habitual delinquency are unfavorable for successful treatment; (b) authoritarian treatment is likely to do more harm than good; and (c) a therapeutic kind of treatment is generally best. There seem to be 2 important causes for delinquent behavior. The adaptive delinquent is typically a product of normal motivation, parental neglect and exposure to delinquent patterns. The maladaptive delinquent is typically a product of extreme frustration and, specifically, parental rejection and family conflict.—R. M. Frumkin.

7054. Panakal, J. J. **Juvenile delinquency.** *Indian J. soc. Wk.*, 1961, 22(3), 263-266.—A radio talk tracing the history of legislation pertaining to juvenile delinquency and reviewing existing programs.—R. Schaefer.

7055. Reifen, David. (Tel Aviv, Israel) **Protection of the child in Israeli courts in sex assault cases.** *J. Jewish communal Serv.*, 1962, 38(4), 351-360.—A new Israel law aimed at protecting children under age 14 who are victims and witnesses of sex offenses is reviewed. The most significant innovations of this new law are: (a) provision that a child under 14 years of age who was involved in a sex offense may be interrogated only by a person appointed for this specific purpose; (b) the child concerned may not give evidence in court unless permitted to do so by the youth interrogator, and (c) the corroborating evidence is necessary for conviction.—M. A. Seidenfeld.

7056. Rothstein, Edward. (City Coll. New York) **Attributes related to high social status: A comparison of the perceptions of delinquent and nondelinquent boys.** *Soc. Probl.*, 1962, 10(1), 75-83.—A comparative study of the way 163 delinquent and 439 nondelinquent teenaged boys perceive attributes

related to high social status. Nondelinquent boys place the greatest stress on loyalty and trustworthiness as contributing to high social status. A much higher proportion of delinquent boys than nondelinquent boys perceive toughness, popularity with girls, fearlessness, notoriety, power to get revenge, shrewdness, wealth, influential contacts, and ancestry as contributing to high social status; however, not one of these attributes is given heavy weight in status rating even by delinquents. Differences between delinquent and nondelinquent boys should be considered relative rather than absolute since they were not attributable to socioeconomic status.—R. M. Frumkin.

7057. Seeley, John R. (York U., Toronto, Canada) **Guidance and the youth culture.** *Personnel Guid. J.*, 1962, 41(4), 302-310.—"We face essentially now, for all children very nearly, what had to be faced for lower-class children in reference to delinquency a generation ago: the fact that, without access to the all-coercing, and all-rewarding structure of the gang, the likelihood of securing any sensible change in delinquent attitudes and activities is as close to zero as anyone could desire."—S. Kavruck.

7058. Shulman, Harry M. (City Coll. New York) **Juvenile delinquency in American society.** New York: Harper, 1961. xi, 802 p. \$8.00.—Chapters are devoted to a wide range of specific topics, such as: "Minority Groups," "Intelligence and Delinquency," and "Juvenile Training Schools and Reformatories." Part II on "Fields, Methods, and Problems of Scientific Delinquency Research" is a concise development of causal theories.—R. W. Deming.

7059. von Hentig, Hans. (U. Bonn, West-Germany) **Das Verbrechen: II. Der Delinquent im Griff der Umweltkräfte.** [Crime: II. The power of the environment over the delinquent.] Berlin, Germany: Springer, 1962. 524 p. DM 59.—Social factors are ambivalent, they prevent and they foster crime. Numerous statistics and excerpts from famous cases illustrate hypotheses on the influence exerted on crime by inflation, economic depression, war, social organizations and groups (including the family groups), and by news and entertainment media. The victim also plays an important role in the influence of the environment upon crime. (This is volume 2 of a demographic trilogy on crime.)—R. Kaelbling.

7060. Wendt, Miriam, & Gerjuoy, Herbert. (Educational Testing Service) **Work attitudes of ward attendants for the criminally insane.** *J. Psychol.*, 1963, 55(1), 43-47.—The Attendants' Attitude Questionnaire (AAQ), with an attached personnel information blank, was administered to ward attendants at the Lima (Ohio) State Hospital for the criminally insane. A significant multiple correlation was obtained, with ward type, age, education, length of hospital service, and length of ward service as the predictor variables, and AAQ scores as dependent variable. However, only age and length of hospital service were predictor variables with significant regression weights. Attendants' attitudes did not depend upon experience on a particular ward type. Considering the low magnitude of the significant multiple correlation, the practical usefulness of the significant predictor variables was questioned. Over-all, attendant morale was much lower at Lima State Hospital than it was found to be by Gerjuoy, et al. (1962) at a general psychiatric hospital.—Author abstract.

PSYCHOSES

7061. Creak, E. Mildred. (Hosp. Sick Children, London, England) **Childhood psychosis: A review of 100 cases.** *Brit. J. Psychiat.*, 1963, 109 (Whole No. 458), 84-89.—Among the 100, strictly selected according to the 9 criteria of childhood psychosis of the *British Medical Journal* 1961 report, were 12 epileptics and 2 cases with cerebral lipidosis. Therapy with the noncommunicating child is difficult.—*W. L. Wilkins.*

7062. Ehrentheil, Otto F., & Davis, Edward T. (VA Hosp., Boston, Mass.) **Degree of fixation of thought content in relation to withdrawal versus nonwithdrawal in hospitalized mental patients observed over 30 years.** *J. nerv. ment. Dis.*, 1962, 135 (5), 455-459.—The hypothesis was tested that in chronic mental patients "the degree of change in present thought content from that of 30 years earlier (at time of admission) is in reciprocal relationship to the degree of withdrawal from environment." Results from a study of 135 patients support the hypothesis.—*N. H. Pronko.*

7063. Perry, John W. (U. California Medical School, San Francisco) **Reconstitutive process in the psychopathology of the self.** *Ann. N. Y. Acad. Sci.*, 1962, 96(3), 853-873.—Psychosis involves a total disruption of the self and its imagery provides insight into the self. The sequence of images among 18 schizophrenics followed a characteristic course, which suggests the archetypes of the sacred kings. Psychotics have the same relations to archetypes as normals but are overwhelmed by them. The relation between the personal and archetype self determines the course of the schizophrenic process. The function of therapy is to restore the capacity for love. (88 ref.)—*B. S. Aaronson.*

7064. Slater, Eliot; Beard, A. W., & Glithero, Eric. (Middlesex Hosp., London, England) **The schizophrenia-like psychoses of epilepsy.** *Brit. J. Psychiat.*, 1963, 109 (Whole No. 458), 95-150.—69 patients with symptomatic schizophreniform psychoses of purely epileptic causation, genetically distinguishable from the nuclear schizophrenias, were followed up for a mean time of 7.8 years. While social interests for those out of hospital were severely impaired, personal and work records were fairly good for almost half. This is an illness with a stormy course leading to general impairment of an organic type affecting both intellectual functions and affective aspects of personality.—*W. L. Wilkins.*

7065. Thorne, Frederick C. (Journal Clinical Psychology, Brandon, Vt.) **Self-consistency theory and psychotherapy.** *Ann. N. Y. Acad. Sci.*, 1962, 96(3), 877-888.—Disorders of self-functioning may be primary disorders of the self or arise from psychopathology at other levels of personality organization. In a study of 100 psychiatric patients, 78 complained of fear of disintegration of self function, 67 of loss of impulse control, 61 of disturbing mental contents, 57 of excessive preoccupation with self awareness, 38 of feelings of self depreciation, 31 of fears of what others might think of one, and 30 of preoccupation with ego competition. Many of these factors can be dealt with directly in psychotherapy in terms of self-consistency theory.—*B. S. Aaronson.*

7066. Wilcox, Katherine W. (Traverse City State Hosp., Mich.) **The pattern of cognitive reorientation following loss of consciousness.** *Pap. Mich. Acad. Sci. Arts Lett.*, 1956, 41, 357-366.—Observations were made on 41 psychotic female patients. The process of cognitive reorientation during recovery following a period of loss of consciousness due to electroconvulsive treatment involves first awareness of the self and "is nearly synonymous with giving one's own name. Correct time orientation is the last to return. There is evidence in the literature that recovery of neurological function and perception during return of consciousness follow a pattern in which the latest phylogenetic developments are restored after the more primitive functions. The post-convulsive sequence of cognitive reorientation as found in this experimental study follows the pattern of the ontogenetic development of orientation in the child."—*S. J. Lachman.*

Schizophrenia

7067. Baxter, James C., Arthur, Sonya; Flood, Constance G., & Hedgepeth, Betty. (U. Kentucky Coll. Medicine, Lexington) **Conflict patterns in the families of schizophrenics.** *J. nerv. ment. Dis.*, 1962, 135(5), 419-424.—Both parents of a group of 12 male and of 6 female patients were interviewed and tested in an effort to evaluate intrafamilial variables. Results indicate that "reliable differences exist between groups of male and female schizophrenics, while the relative amounts of conflict in the two groups can be considered comparable."—*N. H. Pronko.*

7068. Bryant, Arthur Russell. (U. Utah) **An investigation of process-reactive schizophrenia with relation to perception of visual space.** *Dis. sert. Abstr.*, 1962, 22(7), 2460-2461.—*Abstract.*

7069. Davidson, S. I. **Auto-enucleation of the eye: A study of self-mutilation.** *Acta psychother. psychosom.*, Basel, 1962, 10(4), 286-300.—An acutely catatonic schizophrenic male patient enucleated his right eye and made other self-mutilating attempts. Without satisfactory father-relationship and with an intense mother-relationship, incestuous drives released self-punishing behavior. Psychotherapy drugs, and surgery proved equally ineffectual.—*G. Rubin-Rabson.*

7070. Flitsos, George V. (Purdue U.) **Schizophrenics' vs. normal's learning of low vs. high association paired associates.** *Dissert. Abstr.*, 1962, 22(7), 2463.—*Abstract.*

7071. Gromoll, Henry Fred, Jr. (U. Illinois) **The process-reactive dimension of schizophrenia in relation to cortical activation and arousal.** *Dis. sert. Abstr.*, 1962, 22(10), 3741.—*Abstract.*

7072. Herron, William G. (St. Bonaventure U.) **The process-reactive classification of schizophrenia.** *Psychol. Bull.*, 1962, 59(4), 329-343.—Research on the process-reactive classification of schizophrenia indicates there are 2 groups of schizophrenic patients differing in prognostic and life-history variables. It is also possible to demonstrate differences between the 2 groups in physiological measures and psychological dimensions. The evidence does not support a process-organic vs. a reactive-psychogenic formulation of schizophrenic etiology.—*W. J. Meyer.*

7073. King, H. E. (U. Pittsburgh School Medicine) **Reaction-time as a function of stimulus in-**

tensity among normal and psychotic subjects. *J. Psychol.*, 1962, 54(2), 299-307.—Simple lift reaction-time responses to stimuli of varied intensity have been observed among normal and schizophrenic Ss to examine features of the typically retarded psychomotor response of psychotic Ss. 30 normal and 30 chronic schizophrenics performed RT measures at 3 levels of auditory stimulation following extended practice. The observation of a marked discrepancy in group mean latency and variation was replicated. Both groups showed decreases in latency and intrasubject variability to stimuli of greater intensity, being reactive to the same relative extent. The greater absolute reduction in latency by psychotic Ss appears to be a consequent of the initially longer latencies of this group. The findings are related to the ratio of simple to disjunctive RT among comparable subject groups.—*Author abstracts.*

7074. Kodman, F., Jr., Griffith, R., & Sparks, C. (Lexington, Ky.) Wakefulness in catatonic schizophrenia. *Confin. psychiat.*, 1962, 5(4), 189-195.—Measurements of auditory threshold during deep sleep were sought from a sample of catatonic schizophrenic patients. A deep sleep pattern was secured from 1 patient and later replicated. Whereas Kleitman et al. found the auditory threshold for normals during sleep to be elevated approximately 40 db. above audiometric zero, this single patient, on 2 different occasions, showed an elevation of 90 db.—*E. W. Eng.*

7075. Malis, G. YU. Research on the etiology of schizophrenia. (Trans. by Basil Haigh) New York: Consultants Bureau, 1961. xi, 195 p. \$9.50.—This volume, with a preface by Hudson Hoagland, is primarily a report of the author's research on his hypothesis that schizophrenia is produced by a virus. Malis was able to take the position that some of the work on possible endogenous toxic factors is consistent with his hypothesis. More specifically, he tried to determine if a virus or the protein coat of a virus was the source of the toxic factor. The research program is incomplete in that there was no demonstration of the infectious nature of the proposed virus. Citation of European and American literature prior to 1940 is extensive, but there are few such references later than 1940.—*C. L. Winder.*

7076. Marks, John; Stauffacher, James C., & Lyle, Curtis. (Mental Health Research Inst., Ft. Steilacoom, Wash.) Predicting outcome in schizophrenia. *J. abnorm. soc. Psychol.*, 1963, 66(2), 117-127.—Schizophrenic patients leaving a VA hospital for independent life in the community were followed up for a year after departure. They had been rated on ward and at activities, had been interviewed, and had been extensively tested. By 1 year 33 of 78 had returned, but there was little difference in the predeparture measures or in a 1-month home visit between these and those who stayed out. For those staying out, 35 of 111 predictors correlated significantly with at least 1 of 2 year-end adjustment criteria. Social assets predicted no better positively (and may have predicted worse), than psychopathology predicted negatively. Demographic variables, such as time since 1st mental hospitalization, predicted at least as well as tests; and factorially pure test scales predicted no better than empirical scales. (33 ref.)—*Journal abstract.*

7077. Meehl, Paul E. (U. Minnesota) Schizotaxia, schizotypy, schizophrenia. *Amer. Psychologist*, 1962, 17(12), 827-838.—"I hypothesize that the statistical relation between schizotaxia, schizotypy, and schizophrenia is class inclusion: All schizotaxics become on all actually existing social learning regimes, schizotypic in personality organization; but most of these remain compensated. A minority, disadvantaged by other . . . constitutional weaknesses, and put on a bad regime by schizophrenogenic mothers . . . are thereby potentiated into clinical schizophrenia. What makes schizotaxia etiologically specific is its role as a necessary condition. . . . It is my strong personal conviction that . . . schizophrenia, while its content is learned, is fundamentally a neurological disease of genetic origin."—*S. J. Lachman.*

7078. Rosenberg, Larry. (U. Chicago) Social status and participation among a group of chronic schizophrenics. *Hum. Relat.*, 1962, 15(4), 365-377.—Participation in a "patient council" was analyzed. The following hypotheses were formulated: (a) as the degree of mental disorder increases, the salience of socio-economic status decreases as a factor in role differentiation; (b) the more totalistic an institution, the less relevant will socio-economic status be as a factor in the role differentiation of its inmates; (c) degree of participation in a group is a function of the relative status increment resulting from such participation; (d) participation by low-status members will tend to increase as requirements of literacy and verbal fluency are diminished; (e) low-status persons will participate to a greater extent in a group with an "open" opportunity structure; (f) as the degree of sociability increases, the salience of status characteristics as factors in role differentiation decreases. (29 ref.)—*W. W. Meissner.*

7079. Rosenthal, David. (National Inst. Mental Health, Bethesda, Md.) Familial concordance by sex with respect to schizophrenia. *Psychol. Bull.*, 1962, 59(4), 401-421.—"The literature regarding concordance rates with respect to schizophrenia among relatives of both sexes is reviewed. These rates are generally found to be higher for female than male pairs and higher for same-sexed than opposite-sexed pairs of relatives in primary family groups, but not among collateral relatives. The possible role of sampling errors, genetic contributions, and psychological factors in generating such sex-concordance ratios is examined."—*W. J. Meyer.*

7080. Searles, H. F. The differentiation between concrete and metaphorical thinking in the recovering schizophrenic patient. *J. Amer. Psychoanal. Ass.*, 1962, 10(1), 22-49.—Concrete or undifferentiated thinking of severe schizophrenics can exist only in proportion as there is fluidity of the ego boundaries and can be resolved only in proportion as these boundaries become firmly established with therapy. Such boundaries become established by degrees as the patient becomes able to face the intense and conflictual emotions against which the schizophrenic illness system was designed to shield him. The dissolution of ego boundaries is an energetic defense mechanism that is part of the schizophrenic process. Etiology, treatment course, and technique of this schizophrenic thought disorder are discussed.—*D. Prager.*

7081. Spohn, Herbert E., & Wolk, William. (VA Hosp., Montrose) Effect of group problem solving experience upon social withdrawal in chronic schizophrenics. *J. abnorm. soc. Psychol.*, 1963, 66(2), 187-190.—It was hypothesized that chronic schizophrenics exposed to sustained group problem solving experience would tend to improve their levels of social participation on criterion tasks socially more challenging and complex. It was further hypothesized that such improvement would generalize to task performance with total strangers and to social behavior on the ward. All predictions except the one about ward behavior were confirmed by experimental findings with 32 chronic schizophrenic patients. It is suggested that sustained social experience in situations which elicit social participation permit factors to become operative which reduce anxiety associated with socially more challenging, complex situations and thus facilitate participation in such situations.—*Journal abstract.*

7082. Staritsyn, A. S. (Psychoneurological Research Inst., Odessa, USSR) Osobennosti sosudistykh uslovykh i bezuslovykh refleksov u bol'nykh shizofreniei na raznykh etapakh razvitiia zabolnavaniia. [Characteristics of vascular CR and UR in schizophrenics at various stages of the disease development.] *Zh. vyssh. nervn. Deiatel.*, 1962, 12(4), 593-601.—Ss were 43 catatonics (18-25 yr.) and 57 paranoid schizophrenics (26-40 yr.), sick between 3 mo. and more than 3 yr. US was cold water, CS were sounds and words. Recordings were done by means of plethysmograms. Catatonics during the initial period of the disease, showed enhanced reflex excitability in the zones of the cortical and subcortical control of the vascular system. This decreased with the protraction of the disease. Paranoids schizophrenics exhibited at early stages inhibition of the CR and UR. As the disease continued, the inhibition weakened and the excitatory processes increased.—*A. Cuk.*

7083. Syřiřtová, E. (Charles U., Prague, Czechoslovakia) Historický přehled psychoterapie schizofrenního onemocnění. [Historical survey of psychotherapy of schizophrenia.] *Českoslov. Psychol.*, 1962, 6(1), 79-94.—An outline of the historical development of ideas, theories, and practices of psychotherapy of schizophrenia. (Russian & English summaries, 57 ref.)—*V. Bricháček.*

7084. Tate, George Thomas. (U. Kentucky) An Experimental study of two aspects of schizophrenic interpersonal relationships. *Dissert. Abstr.*, 1962, 22(11), 4088.—*Abstract.*

7085. Weakland, John H., & Fry, William F. Letters of mothers of schizophrenics. *Amer. J. Orthopsychiat.*, 1962, 32(4), 604-623.—Several letters to schizophrenic patients from their mothers are presented. The letters all exhibit pervasive patterns of incongruent communication, alternating come-but-go or affection-but-hostility message. There is a pattern of concealed incongruence between closely related messages. No statement is allowed to stand clearly and unambiguously. The type of communication and its effect on the recipient agree closely with the concept of the double bind.—*R. E. Perl.*

7086. Zlotowski, Martin, & Bakan, Paul. (Michigan State U.) Behavioral variability of process and reactive schizophrenics in a binary guessing

task. *J. abnorm. soc. Psychol.*, 1963, 66(2), 185-187.—Process and reactive schizophrenics differ in run producing behavior when attempting to generate a random binary series of heads and tails. Reactive schizophrenics manifest more response variability than process schizophrenics. Evidence for this is a lower correlation for reactives between number of runs in the 1st and 2nd ½ of a series of 300 binary responses. It is of interest to note that reactives are more variable than a normal undergraduate sample whereas process schizophrenics are not (see 34: 7320). The process group produced significantly more runs than the reactive group. This difference appears due to a greater tendency for process schizophrenics to produce runs of 1 (simple alternations), a form of response stereotypy.—*Journal abstract.*

Affective Disorders

7087. Prange, Arthur J., Jr., & Vitols, M. M. (U. North Carolina School Medicine) Cultural aspects of the relatively low incidence of depression in southern Negroes. *Int. J. soc. Psychiat.*, 1962, 8(2), 104-112.—The southern Negro has available to him certain characteristic defenses that tend to mitigate loss of prestige, self-esteem, real goods, and love objects. Basic attitudes include stoicism and subtle defiance. His fundamentalistic religion insists that he actively mourn his losses. The extended family relationship is such that he can share his losses and replace his lost objects. The fact of his oppression, and his sensitivity to it, facilitate the unconscious selection of projection, rather than introjection, as a defensive technique. Depression in the United States could be called the white man's malady. As the Negro comes to share more fully in the white man's culture, he will also share his malady.—*R. M. Frumkin.*

Physiological Correlates

7088. Rubin, Leonard S. Patterns of adrenergic-cholinergic imbalance in the functional psychoses. *Psychol. Rev.*, 1962, 69(6), 501-518.—Effective "adjustments to emergency situations require a maximal, generalized sympathetic response; to attain a maximal level of sympathetic activity, it is not only necessary that increased levels of adrenergic outflow follow the emergency but that the level of cholinergic activity decrease; the neurohumoral dysfunctions that characterize the psychoses represent significant departures from the adrenergic-cholinergic states that characterize the normal individual at rest and during stress; and the varieties of dysfunction represent discrete levels of activity of interacting adrenergic and colinergic mechanism. That is, each pattern of neurohumoral imbalance represents an impairment of function of either the adrenergic or colinergic mechanism or both."—*C. T. Morgan.*

PSYCHONEUROSES

7089. García-Barros Bernabeu, Enrique. (Madrid, Spain) Experiencias de dibujo automático en neurosis. [Cases of automatic drawing in neurosis.] *Rev. Psicol. gen. apl.*, 1961, 16(Whole No. 59), 526-537.—16 neurotic Ss were instructed to read literary works in a loud voice while their right hand held pencil against unseen paper. Later drugs were used for greater disinhibition. 4 Ss produced "auto-

matic, unconscious" drawings with content unrelated to reading material but closely related to their individual anguish or guilt.—E. B. Page.

7090. Laforgue, René. *De la nevrose familiale*. [Family neuroses.] *Evolut. psychiat.*, 1962, 27(3), 313-325.—Family neuroses result from a mental contagion that the individual contracts from his family or social milieu. This theme is elaborated historically and illustrated by case studies. Pursuing the viewpoint of Pavlov and renouncing Freud, the author believes that the self of each individual in the family becomes conditioned by the family milieu to the point where he can no longer function effectively. Concerning treatment, the author states that it is best to work with one individual up to a certain point, and then to treat the other members of his family.—L. A. Ostlund.

7091. Pankow, Gisela. *Das Körperbild bei einem entwurzelten Wahnkranken*. [The body image of an uprooted delusional patient.] *Psyche, Stuttgart*, 1962, 16(7), 440-463.—The psychoanalysis of a previously psychotic African of partial European parentage and background. In contrast to the classical neurosis technique, neither object relations nor interpretations of interpersonal features were stressed, but the aim was to provide the patient with a body he could live in. To this end the therapist concentrated on filling in the gaps in the patient's experienced body image.—E. W. Eng.

PSYCHOSOMATICS

7092. Brown, L. B. Social and attitudinal concomitants of illness in pregnancy. *Brit. J. med. Psychol.*, 1962, 35(4), 311-322.—Ss were 148 consecutive primiparae, who were interviewed and given an inventory including a check-list of body symptoms. "Whether or not pregnancy is found difficult, a time of sickness or unpleasant in some other way appears to depend upon attitudinal factors, rather than on actual experiences—except that experiences in the nuclear family appear to lay a basis for later illness during pregnancy."—C. L. Winder.

7093. Cain, Jacques. (359, rue Paradis, Marseille, France) *Essai de comprehension psycho-somatique de l'état allergique*. [The psychosomatic concept of allergy.] *Evolut. psychiat.*, 1962, 27(3), 339-363.—A historical resume of psychosomatic concepts of allergy indicates diverse theories. Successively, the emotional origin of allergic crises was highlighted by Slaver, Flower, Miller, and Baruch. Next, neurophysiological mechanisms were studied by Reilly, Ziwar, and Courchet. More recently, research focused upon psychoanalytic assessment of the effect of maternal rejection and the allergic type of relationships with objects. The latest phase explores the parallel between emotion, hysteria, and psychosomatics. "It sets the problem on the level of the mother's desire envisaged as a structuring factor of the child's organic disease."—L. A. Ostlund.

7094. Carballo, J. R. (Madrid, Spain) *Influencia de las ideas psicósomáticas en la medicina interna*. [The influence of psychosomatic concepts in internal medicine.] *Rev. Psicol. gen. apl.*, 1961, 16 (Whole No. 60), 765-775.—"The strange thing is not the resistance to or incomprehension of psychosomatic medicine but, to the contrary, how it is able in spite

of all to develop with growing vigor." (20 ref.)—E. B. Page.

7095. Čermák, M., & Dornič, S. (Liečebna pre tuberkulózu, Štola) *Experimentálny výskum emocionálnych reakcií u chorých na tuberkulózu*. [An experimental research of emotional reactions of TB patients.] *Psychol. Stud., Bratislava*, 1961, 3, 195-210.—A reflection of tuberculosis in the emotional sphere of patients was examined by an association experiment, simultaneously recording breathing and intentional and spontaneous motor reactions. The most emotionally effective words were those which did not refer directly to the disease but to its personal and social consequences for the patient. (Russian & English summaries)—V. Bricháček.

7096. Engel, George L. *Fainting*. (2nd ed.) Springfield, Ill.: Charles C Thomas, 1962. x, 196 p. \$7.50.—This 2nd edition has been completely rewritten, and the types of syncope have been reclassified. Physical etiology of fainting is discussed in detail separately for peripheral circulatory inadequacy and cardiac, respiratory-pulmonary, and cerebral disorders. Psychological causation and symptomatology receive scant attention. They are discussed under the headings of hysterical fainting, psychic fainting with acute stress, and fainting with neurotic or psychotic illnesses.—J. C. Brengelmann.

7097. Fennell, George. (Hosp. Sick Children, London, England) *Psychogenic factors in vasomotor rhinorrhoea*. *Brit. J. Psychiat.*, 1963, 109 (Whole No. 458), 79-80.—In a series of 45 patients treated with librium, 20 had full psychiatric examinations. The drug helped few and the psychiatric examination revealed no great incidence of mental disturbance. It is suggested that assumptions about the extent of psychogenic causation need reassessment; tensions are present for all in contemporary urban life. The use of leading questions to show that emotional factors are present does not prove the potency of psychogenic factors.—W. D. Wilkins.

7098. Graber, G. H. *Zyklus und seelische Reaktionen der Frau*. [The menstrual cycle and emotional reactions in women.] *Acta psychother. psychosom., Basel*, 1962, 10(4), 280-285.—A 37-year-old woman in deep psychotherapy showed slight cycle-connected somatic changes, but profound emotional changes grounded in her frustrated desire for a child.—G. Rubin-Rabson.

7099. James, William H. (Dalhousie U., Halifax, Nova Scotia, Canada) *Control data for evaluating the efficacy of psychotherapy in habitual spontaneous abortion*. *Brit. J. Psychiat.*, 1963, 109 (Whole No. 458), 81-83.—Data from the Indiana Institute for Sex Research and from T. E. Reed and E. L. Kelly are analyzed to show the probability of another spontaneous abortion when a woman has had 2 or 3 such. As psychotherapy has been shown beneficial for pregnant habitual aborters—perhaps doubling the possibility of successful term—these data provide control information for series of women obtaining psychotherapy.—W. L. Wilkins.

7100. Knapp, Peter H. (Boston U., School Medicine, Boston) *Models and methods: A psychodynamic predictive approach to bronchial asthma*. *J. nerv. ment. Dis.*, 1962, 135(5), 440-454.—A psychodynamic model and a method for testing some aspects

of the model are described as used predictively in a study of bronchial asthma.—*N. H. Pronko.*

7101. Nagi, Saad. (Ohio State U.) **Socioeconomic stress and arteriosclerotic heart disease.** *Rural Sociol.*, 1962, 27(4), 428-437.—Social and economic factors are related to the incidence of heart disease.—*H. K. Moore.*

7102. Rosengren, William R. (Brown U.) **The sick role during pregnancy: A note on research in progress.** *J. Hlth. hum. Behav.*, 1962, 3(3), 213-218.—Hour-long interviews with 76 female Ss were designed to elicit the nature of their role expectations during pregnancy and background information. About 30 variables were studied statistically. Concerning the sociocultural variables, "the sick role score was negatively correlated with the subject's education, family income, ways-of-life, and positive aspirations, the husband's education, and his occupational status. It was positively correlated with the subject's sick role expectations, her material and negative aspirations, labor-time, and the month of pregnancy at the time of the interviews."—*L. A. Ostlund.*

7103. Sines, J. O. (Washington University, St. Louis) **Strain differences in activity, emotionality, body weight and susceptibility to stress induced stomach lesions.** *J. genet. Psychol.*, 1962, 101(2), 209-217.—144 males and females of 5 different strains of laboratory rats were studied. Results indicate that there are strain differences in all variables studied, and these are more pronounced (and more often statistically significant) among males. Incidence of immobilization-induced stomach lesions was found to be positively related to level of activity and amount of defecation in the open field. The higher mean activity level of the susceptible animals suggested that such animals are less fearful than resistant animals under novel stimulus conditions. This latter interpretation seemed to be consistent with findings of previous studies relating to this area.—*Author abstract.*

EPIDEMIOLOGY

7104. Constantinidis, J., Garrone, G., & de Ajuriaguerra, J. **L'hérédité des demences de l'ade avancé.** [The heredity of senile dementias.] *Encephale*, 1962, 51(4), 301-344.—A review of the literature on senescence, cerebral arteriosclerosis, senile dementia, Alzheimer's disease, and Pick's disease shows a common supposition of constitutional factors in these disturbances of the aged. A study of 814 cases (½ female) revealed 188 related cases which could be located on 88 genealogical trees. 74 other patients had relatives who had suffered from senile dementia, but without hospitalization. The rate of incidence in these families was far greater than in the general population: atrophicodegenerative dementias more so than cerebral arterio-sclerotic dementias. Cerebral vascular fragility seems to be transmitted as a dominant with variable expressivity (penetrance in these cases, 40%). (140 ref.)—*W. W. Meissner.*

7105. Enright, J. B., & Jaeckle, W. R. **Ethnic differences in psychopathology.** *Soc. Process*, 1961-62, 25, 71-77.—Japanese paranoid schizophrenic patients differ from Filipino patients with the same diagnosis in being more restrained and inhibited with more autoplasmic behavior. "In view of anthropological descriptions of Japanese culture as putting tremendous pressures toward conformity and self-control

on the individual, these symptoms are what would be expected if cultural factors contribute to symptom formation." In comparison of psychopathology of different ethnic groups, reliance on standard diagnostic labels concealed clear and important differences in actual symptoms.—*E. L. Gaier.*

7106. Ikeda, Kiyoshi; Ball, Harry V., & Yamamura, Douglas S. (Oberlin Coll.) **Ethnocultural factors in schizophrenia: The Japanese in Hawaii.** *Amer. J. Sociol.*, 1962, 68(2), 242-248.—This study of differential risk in schizophrenia among the Okinawan and Naichi Japanese in Hawaii directs attention to possible links between ethnicity and types of personality disturbances. Although both subgroups within the Japanese are similar in in-hospital diagnoses of schizophrenia, the Okinawans are disproportionately higher in risk. Further research to determine the effects of ethnicity and other socio-cultural influences seems warranted.—*R. M. Frumkin.*

7107. Kleiner, Robert J. Tuckman, Jacob, & Lavell, Martha. (Philadelphia Dept. Public Health) **Mental disorder and status based on Protestant subgroup membership.** *J. soc. Psychol.*, 1962, 58(2), 345-348.—In the present study, with Episcopalians and Presbyterians designated as high status and Methodists and Baptists as low, additional support was obtained for the hypotheses: (a) a low status group will show a greater incidence of extreme aggressive or withdrawal behavior (i.e., the paranoid and other schizophrenic reactions respectively) than a high status group; and (b) a low status group will show an earlier onset of mental illness than a high status group. In one earlier study, status was based on racial membership (white and nonwhite); in the other, on religious affiliation (Protestant and Catholic). The sample in the present study consisted of white Protestant first admissions to a psychiatric evaluation center.—*R. J. Kleiner.*

7108. Lidz, T., Schafer, S., Fleck, S., Cornelison, A., & Terry, D. **Ego differentiation and schizophrenic symptom formation in identical twins.** *J. Amer. Psychoanal. Ass.*, 1962, 10(1), 74-90.—Identical twins seem disposed to develop symbiotically without adequate ego boundaries between them. Problems of narcissism become accentuated. Homoerotic trends are heightened. Within the family one twin usually develops a more dominant and one a more passive role. Initial rivalry for the mother leads to inter-twin rivalry. The superego structure of each twin tends to remain incomplete. Ego ideals may be followed that fit the partial identity of the twin and a pattern that requires complementing by another. Incest and homosexuality are often 2 sides of the same coin—narcissistic problems—rooted in the twin relationship and in family interaction.—*D. Prager.*

7109. Sheeche, Paul R. **Dynamic risk analysis in retrospective matched pair studies of disease.** *Biometrics*, 1962, 18(3), 323-341.—A mathematical model of an exponentially changing risk of disease may be tested with matched pair data obtained from hospital records. Relative incidence as a function of age and other measured variables is considered in the model. An illustration of breast cancer is used.—*R. L. McCornack.*

7110. Szpilka, Jaime. (U. Nacional de Buenos Aires) **Psicodinámica familiar y enfermedad mental: Investigación psicosocial de un grupo de pa-**

cientes del servicio psiquiátrico de un hospital general. [Family psychodynamics and mental illness: Psychosocial investigation of a group of patients from the psychiatric service of a general hospital.] *Acta psiquiat. psicol. Argent.*, 1962, 8(1), 37-41.—Interviews and tests were used to study the family interaction of 220 patients. The sick person is the exponent and depository of anxieties and tensions in the group. The group is thus the unit of sickness. The sick one maintains a relationship of strict identity with the leader. When tensions are evenly distributed, the group functions positively, but a disequilibrium is charged against the sick one who is alienated from the group. Findings: (a) 80% of the patients were educationally and culturally superior to their families; (b) 75% expressed conflicts more intense than other members; (c) all were characterized by others as dreamers, idealists; (d) all exercised or showed qualities of leadership in their groups.—*W. W. Meissner*.

7111. Verbeek, E. (van Heemstralaan, 51, Arnhem, Holland) *A la recherche de l'origine des psychoses endogènes*. [Researching the origins of indigenous psychoses.] *Evolut. psychiat.*, 1962, 27(3), 367-378.—This article is an elaboration of the original nosologic system of Kraepelin. Specifically, it suggests that methods of modern genetic bloodgroup research are relevant to psychiatry. In addition, the contemporary, scientific research in mutations likewise suggests hereditary causality as important in the study of psychoses.—*L. A. Ostlund*.

EDUCATIONAL PSYCHOLOGY

7112. Atutov, P. R. (Scientific Research Inst., Acad. Pedagogical Sciences, RSFSR) *O primeneni kibernetiki v pedagogike*. [On the application of cybernetics in pedagogics.] *Sovetsk. Pedag.*, 1962, 26(9), 147-152.—Methodological problems are examined with the purpose of showing the feasibility of applying cybernetic techniques to pedagogics, including both instruction and education. The application of these techniques will lead to research of greater utility, through the use of objective methods. The primary difficulty, however, stems from the fact that many pedagogic processes have not as yet been formalized, a problem whose solution will require scientific personnel from the fields of engineering, mathematics, pedagogics, and psychology.—*D. G. McDonald*.

7113. Ite'lon, L. B. (M. F. Akhundova Azerbaijanian Pedagogic Inst. Linguistics) *Issledovanie zakonomernostei obucheniya i vospitaniya metodami matematicheskoi statistiki*. [An investigation of the regularities of instruction and education with the methods of mathematical statistics.] *Sovetsk. Pedag.*, 1962, 26(10), 109-124.—The author examines the question of whether or not statistics can be used to solve problems in pedagogic research. In a hypothetical problem, it is shown how such techniques as the *t* and *F* tests, as well as a regression model, can be applied effectively. The underlying assumptions and requirements of these techniques are discussed. It is concluded that the application of such techniques is necessary for the further development of pedagogic science.—*D. G. McDonald*.

7114. Japanese Association of Educational Psychology. (U. Tokyo, Japan) *Annu. Rep. educ.*

Psychol. Jap., 1962, 1, 144 p.—"This Annual Report covers the papers presented at the third annual convention, reports on the Association's project, discussions at the convention, the review of literature in educational psychology published in Japan during the previous year, and a bibliography." The report is in Japanese; the subjects of the papers and abstracts of the projects are in English.—*E. Borrowman*.

7115. Pressey, Sidney L. (U. Arizona) *Psychotechnology in higher education versus psychologizing*. *J. Psychol.*, 1963, 55(1), 101-108.—It has been predicted that college enrollments will double within 10 years. A variety of evidence is presented, suggesting that this crisis can be met by a coordinated program including credit by examination especially at entrance, an "all-year" schedule which should also include off-campus projects or travel and work-study combinations, and independent study aided by auto-instruction. Evidence is submitted indicating that such a plan would probably improve school work, initiate careers earlier, and make careers more fruitful. Plans are indicated for continuing checks on the adequacy of such proposals. In this time of world crisis, investigations without constructive proposals are considered inadequate.—*Author abstract*.

7116. Rozenberg, M. I. (Scientific Research Inst. Pedagogics, Ministry Education, USSR) *Ispol'zovat' dostizheniya kibernetiki v nauchno-pedagogicheskikh issledovaniyakh i shkol'noi praktike*. [The utilization of progress in cybernetics in scientific-pedagogic investigations and scholarly practice.] *Sovetsk. Pedag.*, 1962, 26(6), 70-76.—The principles and operations of cybernetics are outlined, showing how these operations are analogues of natural systems. It is shown that certain problems in educational research can be resolved through the use of cybernetic techniques. The necessity for broad utilization of cybernetic resources in pedagogic science is emphasized.—*D. G. McDonald*.

7117. Samarin, YU. A. (Leningrad, USSR) *Voprosy psikhologii obucheniya i vospitaniya vzroslykh*. [Problems of the psychology of training and education of adults.] *Vop. Psikhol.*, 1962, No. 3, 127-130.—Several problems involved in adult education are briefly mentioned. These include training for independent study, integrating life and technical experience with the training, and developing the understanding of the worker about his occupational role.—*H. Pick*.

7118. Shah, Madan G. *School social service*. *Indian J. soc. Wk.*, 1961, 22(3), 203-208.—Following several case histories is the conclusion that social service facilities for schools are an absolute necessity.—*R. Schaef*.

SCHOOL LEARNING

7119. Bosley, Howard E. (Maryland Dept. Education) *Class sizes and faculty-student ratios in American colleges*. *Educ. Rec.*, 1962, 43(2), 148-153.—Investigations of the merits or demerits of large classes have not affected faculty-student ratios in American state colleges. The number of students taught per day or week by a single professor is a more significant factor than faculty-student ratios or average class sizes. Large group instruction is influenced by personal characteristics of the instructor, subject

matter, maturity, intelligence, and drive of the learners.—W. W. Meissner.

7120. Cambon, J. *Objectivité de la notation des tests de connaissances à réponses libres*. [Objectivity in scoring essay questions on achievement tests.] *BINOP*, 1961, 17(5), 329-334.—Objective standards, thought out in advance for scoring essay questions greatly enhances the reliability of the results. The author prefers this method to wholesale substitution of objective (multiple choice, etc.) tests, fearing that what is gained in objectivity will be at the expense of validity. Objective tests may however be used to supplement essay type examination. For the latter, exact rules for scoring should be set up so as to minimize the weaknesses. A series of suggestions for improving marking procedures is included.—D. Midlin.

7121. Erickson, Stanford C. (Vanderbilt U.) *The place of thinking in an ideal university*. *Amer. Psychologist*, 1962, 17(10), 763-771.—"As behavioral scientists and as citizens we believe in and we exercise free and open intellectual inquiry and the main point of this paper is simply to say that we should also do this as teachers." Major sections are: Education for Excellence, Idiographic Press, Movement Toward the "New Think," and Ultimate Criteria. "The primary place of thinking is not in the curriculum, nor in the lecture room, nor at the faculty meeting. These are places for supportive thinking." The teacher's purpose is to encourage the individually different student to aim his learning talents toward socially worthwhile goals. In the "honest and uncomplicated relationship, between two self-respecting individuals, is the best place to find thinking in an ideal university."—S. J. Lachman.

7122. Esaulov, A. F. (Leningrad, USSR) *Roľ proizvodstvennogo opyta i teoreticheskikh znanij v konstruktivno-tekhnicheskoi deyatel'nosti*. [The role of industrial experience and theoretical knowledge in constructive-technical activities.] *Vop. Psichol.*, 1962, No. 3, 136-148.—Good and bad students with and without industrial experience were given a task of determining the relative stability of a cube and a cylinder. This could be done geometrically or algebraically. The good students with industrial experience were able to solve it both ways. The poor students with industrial experience were more successful than the good students without industrial experience, although the former had some difficulty with precise algebraic solutions. It is suggested that practical experience orders the knowledge obtained in classes and permits the organization of theoretical and practical knowledge.—H. Pick.

7123. Fleszner, Edda. *Praktyka w szkole i szkola praktyki*. [Practical work in school and the school for practical work.] *Psychol. wych.*, 1962, 5(3), 281-289.—"Making things practical" is of continual concern to teachers, while psychologists, who have marginal interests in this area, spend their efforts on transfer experiments. When teachers are "practical," they tend to deal with only a small aspect of reality which requires only a minimum of analysis and abstraction. Consequently, teachers should consider the complex work-a-day world when they relate theory to practice.—H. Kaczkowski.

7124. Fowler, William. (U. California, Berkeley) *Teaching a two-year-old to read: An experiment in early childhood learning*. *Genet. Psychol.*

Monogr., 1962, 66(2), 181-283.—E's 2-year-old daughter was given daily reading instruction over 9 months. Various play-activity methods and fabricated, simplified reading materials (including phonics) were used experimentally. Continuous measures of reading progress, methods, and S's emotional status were recorded and pre- and post-IQ tests were given. After 7 months, S had a 250 word, out-of-context recognition vocabulary; read individual 2-5 word sentences and began to read preprimers; and perceived words rather precisely through phonic cues. Then motivations dropped and emotional problems arose, apparently due more to starting nursery school than to hypothesized reading pressures. Follow-up to age 5½ showed S reading at 3rd-grade level, enjoying many interests, and well-adjusted.—Author abstract.

7125. Garverick, Charles M., & Carter, Harold D. (U. California, Davis) *Instructor ratings and expected grades*. *Calif. J. educ. Res.*, 1962, 13(5), 218-221.—A cluster analysis was made of scores on an instructor rating form completed by 164 college students in an introductory educational psychology course, and on the same instructor. "A cluster composed of items related to expected grades was found to be almost independent to a second cluster which included items concerned with general instructor effectiveness. . . . No statistically significant relationship was found between the measured ratings of an instructor by his students and the grades mentioned as being expected or deserved."—T. E. Newland.

7126. Grodskaya, N. V. (Inst. Psychology USSR, Kiev) *O razvitií myshleniya uchashchikhsya v protsesse usvoeniya sistemý odnorodnykh ponyatií*. [On the development of thinking of pupils in the process of mastery of homogeneous concepts.] *Vop. Psichol.*, 1962, No. 3, 106-116.—A study of the development of thinking processes was carried out using mastery of grammatical parts of speech and sentences as the experimental task. Pupils of the 6th and 7th grades were taught to identify 1st subject and predicate, 2nd objects and predicate adjectives, and finally adverbs. In the experimental groups the method used involved getting the pupils to respond to increasingly more general cues. The control groups were taught in the ordinary class room manner and showed much less ability to transfer to the more abstract task involved with adverbs.—H. Pick.

7127. Ignatyev, E. I. (Psychological Inst., Moscow, USSR) *A tanulók reprodukív képzetének fejlődése*. [Development of the reproductive imagination of school-children.] *Magyar pszichol. Szle.*, 1961, 18(2), 157-162.—Reproductive imagination is the basis for most educational processes. In nursery age children this ability is inadequate due to imperfection of the observation process. Gradually reproduction becomes more exact, especially if it is connected with some important activity for the child. Until 7th grade there is a need to rely upon the perception of real objects and the results of reproduction frequently have the character of "reaction of part-vision." In the 10th grade pupils are capable of reproducing perfectly according to the given scheme. "In the course of development the creation of the pictures is accompanied in an increasing degree by an analyzing-synthesizing activity, by judgment, thinking, volitional display of strength, promoting the

imaginary picture to be kept in memory."—E. Freidman.

7128. Kulyutkin, YU. N. (Leningrad, USSR) O vliyanií proizvodstvennogo opýta uchashchikhsya vechernikh (smennýkh) shkol na usvoenie imi teoreticheskikh znanií. [On the influence of production experience of night school pupils on their mastery of technical knowledge.] *Vop. Psikhol.*, 1962, No. 3, 131-135.—2 simple demonstration experiments are reported. In one, a lesson about the transmission of rotary motion shows better retention and transfer when it is caught in the context of the practical experience of the pupils then when it is taught in the usual manner. In the other, in a course on the physical and chemical aspects of steel, there resulted an increase in knowledge in practical and theoretical aspects of the use of steel and steel production as well as in the straight course material.—H. Pick.

7129. Tausch, Reinhard. (Pädagogie Hochschule, Kettwig/Ruhr, Germany) Merkmalsbeziehungen und psychologische Vorgänge in der Sprachkommunikation des Unterrichts. [Characteristic relations and psychological processes of verbal communication in teaching.] *Z. exp. angew. Psychol.*, 1962, 9(3), 474-508.—The verbal behavior of 10 teachers and 318 pupils during 10 hours of instruction was recorded on tape. Verbal characteristics of teachers and pupils (i.g., frequency of words, length of phrases, verbal style, etc.) occur with predictable probability intra-individual as well as inter-individual. Contrary to expectations, insignificant intra-individual differences were found among teachers with respect to verbal characteristics; however, large inter-individual differences were observed. Attitudes specific to the personality structure determined the later.—W. J. Koppitz.

7130. Trabue, Ann. (Radford Col.) Classroom cheating: An isolated phenomenon? *Educ. Rec.*, 1962, 43(4), 309-316.—Cheating is discussed in the light of pressures imposed on the students by parents and the competitive academic atmosphere. Cultural values are at stake which it is the part of responsible teachers to preserve. But acceptance of the child, even when he does wrong, must be carefully dissociated from acceptance of the deed.—W. W. Meissner.

INSTRUCTIONAL AIDS

7131. Armed Services Technical Information Agency. Teaching machines: A report bibliography. Arlington, Va.: ASTIA, 1962. v, 49 p.—The bibliography contains sections on ASTIA documents, books, dissertations, patents, periodicals, and research grants.—E. L. Borrowman.

7132. Brooks, Lloyd Oliver. (U. Houston) Response latency in programmed learning: Latency related to error rate. *Dissert. Abstr.*, 1962, 22(7), 2471.—Abstract.

7133. Cohen, Ira S. (U. Buffalo) Programmed learning and the Socratic dialogue. *Amer. Psychologist*, 1962, 17(10), 772-775.—2 modes of presentation of a learning sequence, the Socratic method and a programmed adaptation, are specified and paralleled in a chart for comparison purposes. The programmed adaptation was tested by administering it, in booklet form, to 32 psychology undergraduates. On the immediate criterion test, 17 were able correctly to pre-

sent the geometric theorem. A revised program was administered to an equivalent group of 33 students. "27 were able correctly to present the geometric theorem on the immediate criterion test. . . . It is clear that programmed instruction is similar to the Socratic dialogue, but in its differences lies the potential for widespread and enduring changes in the educational enterprise."—S. J. Lachman.

7134. Jacobs, Paul I. (Educational Testing Service) Some relationships between testing and auto-instructional programing. *Audiervis. commun. Rev.*, 1962, 10(6), 317-327.—A discussion of "two problems in programing which do not usually occur in testing, but for which testing considerations are relevant: (a) the optimal ordering of auto-instructional material; (b) the assignment of different sequences of material to different learners."—R. E. Schutiz.

7135. Kopstein, Felix F., & Cave, Richard T. (Wright-Patterson AFB, O.) Preliminary cost comparison of technical training by conventional and programmed learning methods. *USAF MRL tech. docum. Rep.*, 1962, No. 62-79. iv, 19 p.—This report considers the comparative costs of training airmen for electronics specialties with automated and conventional instruction. 3 different methods of estimating the costs of the prototype automated course for communications electronics principles, Keesler Air Force Base, Mississippi, are compared with the estimated costs of the current conventional course. Costs of automated instruction compare favorably with those of the conventional course regardless of the method of estimation. Further, these programing costs continue to diminish as the number of students trained increases, while conventional costs remain constant. Generalizations related to the economic factors of auto-instruction are discussed in terms of general application to Air Force training courses.—USAF MRL.

7136. Lumsdaine, Arthur A., & Glaser, Robert. (Eds.) Teaching machines and programmed learning: A source book. Washington, D. C.: National Education Association, 1960. xii, 724 p. \$7.50.—A compendium of articles classified into 5 parts: "Purpose and Scope of This Book," "Pressey's Self-Instructional Test-Scoring Devices," "Skinner's Teaching Machines and Programming Concepts," "Contributions from Military and Other Sources," and "Some Recent Work." Part I includes an introductory overview (Lumsdaine) and a preview (Glaser). Part II presents S. L. Pressey's 3 original papers on teaching machines and a paper on a punch board device, as well as experimental studies on programed guidance (J. C. Peterson), drill by machine (J. K. Little), a new self-scoring testing device for improving instruction (G. W. Angell & M. E. Troyer), and law of effect (A. L. Stephens). In Part III, papers by B. F. Skinner, D. Porter, J. G. Holland, L. E. Homme, C. B. Ferster, S. M. Sapon, S. R. Meyer, and W. Hively define the reinforcement approach. In Part IV, general and military papers cover educational invention (I. Mellan), programing (N. A. Crowder, E. Z. Rothkopf), instrumental papers (P. K. Weimer, L. J. Briggs, G. Pask, F. M. Gardner, D. E. Damrin, Glaser), and the technology of teaching (S. Ramo, J. D. Finn). In Part V, recent work covers special projects (J. A. Barlow, Glaser & Homme, J.

E. Coulson & H. F. Silberman, E. B. Fry, T. F. Gilbert, A. Amsel) and a general appraisal of machines (J. W. Blyth, D. J. Mayhew & A. F. Johnson, Pressey, Lumsdaine, W. J. Carr).—K. U. Smith.

7137. Schutz, Richard E., Baker, Robert L., & Gerlach, Vernon S. (Arizona State U.) Teaching capitalization with a programed text. *Audiovis. commun. Rev.*, 1962, 10(6), 359-363.—A report "of an experimental application with elementary school children of a self-instructional program designed to develop ability to capitalize words acceptably." The novel research problems created by "the characteristics of the typical . . . classroom and the requirements imposed by automated instruction" are discussed.—R. E. Schutz.

7138. Shestakov, A. I. Opyt primeneniya "obichayushchikh mashin" v Soedinennykh Shtatakh Ameriki. [Information on the application of "teaching machines" in the United States.] *Sovetsk. Pedag.*, 1962, 26(12), 60-72.—The author reviews several American reports on the effectiveness on teaching machines. The general characteristics of both machines and machine programs are discussed, as well as some experimental data showing the relative effectiveness of various procedures with several different subject areas. It is concluded that methods of programmed instruction are deserving of broad study.—D. G. McDonald.

7139. Solov'eva, E. E. (Scientific Research Inst., General & Polytechnical Education, Acad. Pedagogical Sciences RSFSR) Opyt primeneniya mashinnoy tekhniki v pedagogicheskom issledovanii. [An experimental comparison of machine techniques in a pedagogic investigation.] *Sovetsk. Pedag.*, 1962, 26(8), 116-129.—Students in 32 biological science classes were shown classroom films under 4 conditions: (a) teaching film without discussion from the instructor, (b) film followed by discussion led by the instructor, (c) a "fragmented film" with discussion interspersed, and (d) control lessons in which films were not shown. Measures of learning indicated that students generally performed best when films were shown in the "fragmented" manner. It was concluded that the "fragmented" method of presentation is of greater didactic value with both students and teachers of various abilities and qualifications.—D. G. McDonald.

ATTITUDES & ADJUSTMENT

7140. Akavya, Uriel. Tahbivey noar hamesayem bet-sefer yesodi. [Hobbies of children entering secondary school.] *Hahinukh*, 1961-62, 34, 405-408.—Questionnaires were administered to 80 boys and 80 girls, 13½-14½ years old, entering rural secondary school to obtain information on hobbies as such, their quantity, frequency, and variability with kind of residence and parents' profession.—H. Ormian.

7141. Amthauer, Rudolf. Ergebnisse einer Studie über krankheitsbedingte Fehlzeiten. [Results of a study on absenteeism caused by sickness.] *Psychol. Rdsch.*, 1963, 14(1), 1-12.—Intelligence, performance, and teacher ratings for 2 groups of apprentices were compared. Boys in Group 1 had been absent for not more than 3 days a year; boys in Group 2 had been absent for more than 30 days. The low absentee group scored better in all categories than the high absentee group, indicating strongly motivational com-

ponents in absenteeism. Social-psychological, educational, and hygienic measures to overcome the problem are discussed.—W. J. Koppitz.

7142. Blondel, J. Etude sociométrique dans les classes de cours moyen, de fin d'études et de sixième. [Sociometric study in several grades, corresponding to Grades 5 through 8.] *BINOP*, 1962, 18(3), 163-180.—Sociometric choices in 26 classes, based on 3 criteria (play, work, and friendship) were analysed. The most popular pupils tended to be younger, more intellectually inclined, and more imaginatively creative. Their popular status was found to be stable over several years. Popularity in this school setting and at this age was most highly correlated with scholastic achievement.—D. Mindlin.

7143. Byers, Joe J. (U. California, Berkeley) A study of the level of aspiration of academically successful and unsuccessful high school students. *Calif. J. educ. Res.*, 1962, 13(5), 209-216.—121 Ss in E's American history class were categorized as a Success Group (N = 55; mean academic school grade = 34.15; mean Hermon-Nelson IQ = 110.4) and as a Failure Group (29; 10.41; and 91.9, respectively). Each student set his goal, privately with E, 5 different times. Analysis of the discrepancy scores under 4 success-failure conditions led to the conclusions: "In general both past and current experiences with academic tasks is significantly related to the goal setting patterns of students in an actual (classroom) learning situation. Past experience, however, appears to operate only until S's gain experience in the current task. Failure experience, whether past or current, is more closely associated with high and unrealistic goal setting than is success experience. On the other hand, current and past success experiences are more closely related with realistic and in some cases low and unrealistic goal setting."—T. E. Newland.

7144. Frumkin, Robert M. (State University Coll., Oswego, N. Y.) The sex, love, and marriage questions of freshman and sophomore college students: Implications for family life education. *J. hum. Relat.*, 1962, 10(4), 488-494.—A comparison of 587 questions asked by college students, in the latter part of the 1950's, about family and sex behavior with questions asked by young men and women during World War II (1942-46) and reported in studies by Brown (1948) and Ellis and Fuller (1950). The findings indicate that there are no signs that the ignorance and anxieties of modern youth have changed significantly in the past 2 decades except, perhaps, in relation to attitudes toward premarital sexual intercourse and petting. Such findings suggest that teachers of courses concerned with preparation for family life re-examine their methods and materials and help young people seek satisfactory answers to the questions that trouble them.—Author abstract.

7145. Kahn, Jack H., & Nursten, Jean P. School refusal: A comprehensive view of school phobia and other failures of school attendance. *Amer. J. Orthopsychiat.*, 1962, 32(4), 707-718.—The literature on breakdown in school attendance is reviewed. Cases of school refusal can be grouped under 3 headings: psychoneurotic, including phobic conditions; character disorders; and psychotic conditions. Treatment should be directed to the underlying condition rather than the symptom of school refusal. (59 item bibliogr.)—R. E. Perl.

7146. Kinnane, Mary. (Boston Coll.) Attitudes of college students toward college teaching as a career. *Educ. Rec.*, 1962, 43(2), 139-147.—Questionnaire data from 3380 students in 45 New England institutions and interview data from 76 students on the dean's list at 6 institutions provide the empirical base of this study. Students seem most impressed by low salaries and the abundance of teaching positions. Professional prestige is seen on the upgrade, but students feel that notions of college teaching as a second-rate profession are perpetuated by some teachers who encourage students to be "a physicist rather than a teacher of physics."—*W. W. Meissner*.

7147. Martucci, Leo George. (Rutgers U.) Some correlates of responses to a standard interview among high school boys. *Dissert. Abstr.*, 1962, 22(9), 3266-3267.—*Abstract*.

7148. Murray, Evelyn. (United States Dept. Labor) Work: A neglected resource for students. *Personnel Guid. J.*, 1962, 41(3), 229-233.—"A program of keeping youth in school and providing them work experience and the type of training they can absorb seems to be one of the best methods our society can offer today to develop youth. The supervised work-and-study program is one way of shortening the period of economic and psychological dependence which at the same time gives young people an opportunity to remain in school. The trend is to delay youth's entrance into the full-time labor market. Organized methods of insuring work and school become necessary."—*S. Kavruck*.

7149. Olesen, Virginia Lee. (Stanford U.) Sex role definitions among college undergraduates: A study of Stanford freshmen. *Dissert. Abstr.*, 1962, 22(10), 3761-3762.—*Abstract*.

7150. Rao, N. A. Hanumantha. A comparative study of the reading habits of college and high school students. *J. Karnatak U.*, 1961, 5, 62-92.—A questionnaire was administered to 318 college and 73 secondary school students. It was found that college students read journals and novels. They preferred regional language. They read more than high school students.—*U. Pareek*.

7151. Ruthenberg, Donald Burton. (U. Denver) Differences in staff perceptions of rules, regulations, policies, and procedures in residence halls at the University of Denver. *Dissert. Abstr.*, 1962, 22(10), 3762.—*Abstract*.

7152. Vignoli, S. Una ricerca sull'importanza del social-sense nella scuola, visto con il Test Tsdek ed il test sociometrico del Moreno. [Study of importance of social sense in school, as seen through the Tsdek Test and Moreno's sociometric test.] *Riv. Psicol. soc.*, 1962, 29(2), 153-161.—There is a relationship between school maladjustment, insecurity, and lack of a clear sense of moral evaluation. However, these variables are not related to academic performance.—*L. L'Abate*.

SPECIAL EDUCATION

Reading

7153. Betts, Emmett Albert. (U. Miami) Impact of adult reading on pupil achievement. *Education*, 1961, 82(1), 29-35.—"At present there is a speed-reading boom. However, the facts point to the

need for more emphasis on discriminative reading—on the 'pursuit of excellence.' This needed emphasis on discriminative reading requires planned teaching of depth reading."—*C. T. Morgan*.

7154. Davis, F. B., & Davis, Charlotte C. Davis Reading Test. New York: Psychological Corporation, 1962. (2 ser., 4 forms each. 40 min. Manual, 31 p.)—A test yielding scores on 2 reading variables: speed and level of comprehension. For Series 1, usable in Grades 11-13, the manual gives scaled scores and percentile ranks equivalent to the raw scores for each form. The same statistics are given for Series 2, usable in Grades 8-11. Parallel form reliability and standard errors of measurement of each grade level are presented as well as validity coefficients using school marks, aptitude tests, and other reading tests as criteria.—*N. M. Chansky*.

7155. Duker, Sam. (Brooklyn Coll.) A bibliography on individualized reading. Brooklyn, N. Y.: Sam Duker, 1962. 15 p. \$1.50.—350 citations, indexed.

7156. Myklebust, Helmer R., & Johnson, Doris. (Northwestern U.) Dyslexia in children. *Except. Children*, 1962, 29(1), 14-25.—"The problem of childhood dyslexia has been discussed. A definition and frame of reference was given whereby this type of reading disability was used as a psychoneurological learning disorder. A syndrome associated with childhood dyslexia was presented with case illustrations. While much remains to be done by way of developing remedial educational procedures, it is apparent that when a precise diagnosis is made of the major and minor learning disorders and when the language apparently is based on the result, the outlook is favorable for children having this condition."—*J. Z. Elias*.

7157. Nair, Patricia Jo. (Clark U.) Distancing: The application of a development construct to learning disability. *Dissert. Abstr.*, 1962, 22(9), 3267.—*Abstract*.

Mental Retardation

Gifted Students

7158. Hughes, Herbert H., & Converse, Harold D. (Colorado State Coll., Greeley) Characteristics of the gifted: A case for a sequel to Terman's study. *Except. Children*, 1962, 29(4), 179-183.—A critique of Terman's study. "Apparently few researchers have been concerned with the contrast between the number with IQs of 140 or above (approximately .4 per cent) located in Terman's search for the gifted and the number with IQs of 140 or more (1.1 per cent) in the 1937 revision of the Stanford Binet." Other weaknesses suggest the need for improvements in research design in the study of the gifted.—*J. Z. Elias*.

7159. Norman, Ralph D., Clark, Betty P., & Bessemer, David W. (U. New Mexico) Age, sex, IQ, and achievement patterns in achieving and nonachieving gifted children. *Except. Children*, 1962, 29(3), 116-123.—"Two groups of 6th grade children with IQs of 130 or more on the California Test of Mental Maturity were defined as achievers or nonachievers respectively, based on anticipated achievement on the California Achievement Tests." Significant differences between these 2 groups were found in terms of age, sex, language, IQs, nonlan-

guage IQs, consistency of scores on the latter 2 measures, and total IQs. The "anticipated achievement in Arithmetic Reasoning was significantly highest of all CAT subtests among both achievers and nonachievers, but that in spelling was significantly lowest among the latter."—*J. Z. Elias.*

7160. Scarpellini, C. Gli alunni intellettualmente dotati nel giudizio scolastico e psicologico e nell'ambiente socio-culturale. [Intellectually gifted students through academic and psychological evaluation in socio-cultural environment.] *Arch. Psicol. Neurol. Psichiat.*, 1962, 23(6), 493-519.—Teacher's ratings of school children agree only in part with psychometric evaluation and tend to be favorable for the child. There is a strong relationship between high socioeconomic background and exceptional intelligence. Physical normality is highly associated with superior intelligence.—*L. L'Abate.*

EDUCATIONAL GUIDANCE

7161. Bonnardel, R. Diagnostic et pronostic en orientation scolaire et professionnelle. [Diagnosis and prognosis in academic and vocational guidance.] *BINOP*, 1961, 17(5), 307-328.—After reviewing theories of intelligence (general vs. factors vs. specific aptitudes), the author discusses shortcomings of scoring procedures and limitations of the tests in predicting success in various studies and professions. Characteristics other than intelligence and knowledge on tests are important, such as motivation, perseverance, interests, and ability to get along with others. Studies of correlations between various measurable characteristics and the eventual success in a specific situation (profession, school, etc.) are most useful and necessary for establishing effective prognostic measures. (24 ref.)—*D. Mindlin.*

7162. Crow, Lester D., & Crow, Alice. (Eds.) Readings in guidance: Principles, practices, organization, administration. New York: David McKay, 1962. xii, 626 p. \$3.95.—In covering the 4 areas listed in the title, 95 articles are reproduced. Topics discussed include: "Concepts and Problems of Guidance," "Problems of Personal Development," "Guidance and Individual Abilities," "Personal Values and Discipline," "Various Guidance Approaches," "Guidance in Group Situations," "Evaluation in Guidance," "Occupational Information and Vocational Guidance," "Parent-School Cooperation in Guidance," "Guidance in the Elementary School," "Guidance in the Junior High School," "Guidance in the High School," "Guidance Programs in School Systems," and "Guidance and Policy." Only a few of the articles are research reports. Several are copies of administrative memos outlining policies and procedures. For brevity, nearly all references have been omitted.—*W. Coleman.*

7163. D'Costa, A. Report on educational counseling (streaming). *J. voc. educ. Guid., Baroda*, 1961, 8(1), 37-46.—A report of an aptitude testing program for the placement of Class VIII pupils in Anglo-Indian schools of West Bengal, India, begun in 1959 and conducted by the Calcutta, Bureau of Vocational and Educational Counseling. The DAT battery was originally used but these tests were found to be too difficult. A general intelligence test by Ray was substituted in 1961, consisting of 3 subtests (verbal, numerical, spatial) from which 9 subscores may be obtained. Additional tests were constructed for

other aptitudes, as clerical speed and accuracy, memory. A total of 18 tests comprised the test battery. All scores were converted into stanines. School achievement is measured by the average grade obtained in at least 3 examinations in the same school subject (also converted to stanines). From all this a final report is made concerning the recommended "stream" (i.e., program as Humanities or Science) and the vocational plans for the student.—*W. L. Barnette, Jr.*

7164. Eells, Kenneth. (California Inst. Technology) Voluntary versus compulsory counseling with regard to college entrance plans. *Personnel Guid. J.*, 1962, 41(3), 234-239.—Of 128 poorly qualified applicants for admission to the University of Illinois, about ½ volunteered for counseling when it was offered. About 3 times as many of this group decided not to enroll after being shown the chances of academic success. However, no significant differences in later academic success was found between the group which volunteered for counseling and the group which reported for a required interview.—*S. Kavruck.*

7165. Goertzen, Stan M., & Ctrong, Donald J. (San Francisco State Coll.) Counseling practices in the small colleges and universities of the Pacific northwest: A twelve-year follow-up study. *Personnel Guid. J.*, 1962, 41(3), 254-259.—Results are for 2 surveys: the 1st in 1948 with 45 institutions, the 2nd for 52 schools in 1960. A high percentage of counseling staff combines counseling with administration. Few counselors were found without teaching commitments. Greater use of specialists for referral in psychology and psychiatry was made. Advising and educational counseling remained the focus for counseling programs.—*S. Kavruck.*

7166. Goldburgh, Stephen J., & Penney, James F. (Boston U.) A note on counseling underachieving college students. *J. counsel. Psychol.*, 1962, 9(2), 133-138.—An outline of a "counseling procedure for dealing with underachieving college students on an individual relationship basis of short duration and restricted objectives."—*E. R. Oetting.*

7167. Gonyea, G. G., & Warman, R. E. (U. Texas) Differential perceptions of the student dormitory counselor's role. *Personnel Guid. J.*, 1962, 41(4), 350-355.—The ideal student counselor is characterized by needs for nurturance and intraception, to a lesser extent by dominance and achievement, and least of all by autonomy and exhibitionism.—*S. Kavruck.*

7168. Hardee, Melvane Draheim. (Florida State U.) Research on college students: The student personnel worker's view. *Educ. Rec.*, 1962, 43(2), 132-138.—Problems connected with initiation of student personnel services in new institutions and the development of new methods for identifying the characteristics of students and describing the climate of learning are discussed. 4 educational needs are examined: (a) construction of well-founded premises for altering traditional student personnel programs, (b) making explicit the bases for institution of new programs, (c) recognizing current trends in identifying student characteristics, and (d) utilizing research results in current programs.—*W. W. Meissner.*

7169. Ivey, Allen E. (Bucknell U.) Role conflict in counseling. *J. counsel. Psychol.*, 1962, 9(2),

139-143.—On a questionnaire, students show no differences in satisfaction with interviews or with total guidance program, whether the counselor is or is not their teacher. They did express greater willingness to discuss psychological problems in the latter case.—*E. R. Oetting.*

7170. Kerr, William D. (U. Illinois) Student perceptions of counselor role in the college decision. *Personnel Guid. J.*, 1962, 41(4), 337-342.—Almost $\frac{2}{3}$ of students decide to attend a college between Grades 9 and 12. The counselor is seen as the most accurate source of information.—*S. Kavruck.*

7171. Khatri, A. A. Socio-cultural factors in guidance of college students. *J. voc. educ. Guid., Baroda*, 1961, 8(1), 30-36.—A presentation of some significant socio-cultural factors in the life space of college students in India, data for which are based on approximately 80 self-referrals to the Student Psychological Center at the author's school in Ahmedabad, India. The clinic has been in operation for 7 months. Sample cases are discussed where forced marriages are involved; special psychological problems with the "scheduled castes" are indicated; the conflict of the old culture versus the new is high-lighted. Familism and duty as values are being replaced by individual happiness as the important value.—*W. L. Barnette, Jr.*

7172. Korn, Harold A., & Parker, Edwin B. (Stanford U.) A normative study of the S.V.I.B. using an objective method of pattern analysis. *Personnel Guid. J.*, 1962, 41(3), 222-228.—Rules suggested by Darley for analysis of interest patterns do not meet the criteria of objectivity and reproducibility. As alternatives, the following are suggested: primary pattern (a majority of scores B+ or higher on the specific occupational keys), secondary pattern (a majority of scores B or higher, provided that it does not qualify as a primary pattern), reject pattern (a majority of scores at a standard score of 15 and below).—*S. Kavruck.*

7173. Mehta, H. P. Guidance needs and problems as perceived by headmasters of secondary schools of Ahmedabad City. *J. voc. educ. Guid., Baroda*, 1961-62, 8(2-3), 20-35.—A "feeler" study to ascertain what local headmasters in Ahmedabad, India thought about guidance programs and their readiness for such. 30 headmasters were interviewed, selected by a stratified sampling technique. Vocational and educational needs of students were the most frequently mentioned; the most frequent source of difficulty was localized with parents (disinterested or uncooperative with guidance programs). Headmasters are also faced with restrictions and rigidities imposed by the state department of education; these constitute a real obstacle to the development of guidance.—*W. L. Barnette, Jr.*

7174. Parameswaran, E. G., & Muthayya, B. C. (U. Madras) Influence of experimental instructions on vocational choice of adolescents. *J. voc. educ. Guid., Baroda*, 1962, 8(4), 23-27.—The report is based on 31 high school students, Grades 10-11 in an Anglo-Indian school. Students were asked to list 3 jobs they would like to do when they grow up and 2 jobs they most disliked. 10 days later, after a talk about the difficulties of getting certain preferred jobs and where the speaker also emphasized the dignity of work, the request was repeated. The number of jobs disliked declined dramatically. Changes of preferred

jobs were greatest for 3rd choice with fewest changes in 1st choice. The authors conclude that with well-worded instructions the class teacher may bring about greater stability in student job preference.—*W. L. Barnette, Jr.*

7175. Rezler, A. Occupational choice patterns in higher secondary schools. *J. voc. educ. Guid., Baroda*, 1961-62, 8(2-3), 1-4.—Boys and girls of high school Grades 9 through 11 in an Indian industrial community were asked to name the occupation they wanted to follow after completion of their studies. 2 sections were involved, one Hindi and one Bengali. As in the United States, there is the same wide discrepancy between choices (mostly professional) and available jobs for the boys; there were fewer undecided boys, even at Grade 9, than in the United States (only 8% for this Indian sample). The majority of girls select either medical doctor or teacher. The author advises that the British system of student selections be adopted but to postpone such selection until age 13-14. Such a procedure would prevent a great deal of wastage which India can ill afford.—*W. L. Barnette, Jr.*

7176. Riddle, C. W. (U. Hawaii) The problems of Indian college students. *J. voc. educ. Guid., Baroda*, 1962, 8(4), 17-22.—A nation-wide questionnaire study of the problems of students was done at the request of the All-India Educational and Vocational Guidance Association. The questionnaire was pretested and went through several revisions before the final form was constructed in 4 languages (English, Hindi, Marathi, Gujarathi). The committee hoped to study 1% of the college student population or 7471 students for 1958-59. About 7500 forms were sent out but only 3100 were returned. The questionnaire included 40 possible problems (examples: proper study methods, making friends, slow reading). Summary results are given for males and females, for students living in hostels and those living at home, the former have slightly more problems. About 85% of all students indicated they would welcome more help on problems from someone connected with the colleges they were attending.—*W. L. Barnette, Jr.*

7177. Roy, S. K. A vocational case study. *J. voc. educ. Guid., Baroda*, 1961-62, 8(2-3), 60-66.—A report of a 23-year-old Indian, junior executive in a private firm, now poorly adjusted since the present job does not satisfy his needs. He is still in the exploratory stage; earlier vocational guidance would probably have steered him into the area of English, an area of college study that his family would not allow. The case is presented, aside from special Indian features, to highlight the need for guidance. The author believes there must be many cases like this in India.—*W. L. Barnette, Jr.*

7178. Sinha, A. K. P. (Patna U. India) Counseling services in universities. *Indian J. Psychol.*, 1962, 37(1), 1-9.—In his Presidential Address before the Indian Psychological Association, the author reviews the nature and scope of counseling services, the role of the counselor at college level, and the importance of counseling in furthering educational goals. He presents a classified list of typical student problems encountered in an established guidance center (Patna) and makes a plea for more widespread introduction of student counseling services in colleges and universities of India.—*J. T. Cowles.*

EDUCATIONAL MEASUREMENT

7179. Germain, José, & Pascual, Marcelo. (Madrid, Spain) Estudio del Test Mosaico de Gille en una muestra de escolares madrileños. [Study of the Gille Mosaic Test in a sample of Madrid students.] *Rev. Psicol. gen. apl.*, 1961, 16(Whole No. 59), 585-614.—The Gille Mosaic Test, developed in France, was administered to 559 Spanish students aged 8-16. It consists of 62 items, verbal and quantitative, knowledge and reasoning, and item analyzed in detail. It correlated in low middle ranges with grades in math, letters, and deportment; slightly higher (.55) with academic intelligence tests; and .74 with itself (split-half).—E. B. Page.

7180. Womer, Frank B. (U. Michigan) The need for the National Merit Scholarship Qualifying Test: A Michigan Study. *Personnel Guid. J.*, 1962, 41(3), 218-221.—Since the study indicated that high schools can readily identify the top 10% of their own students on the basis of test scores and staff judgments, the question is raised concerning the possible elimination of the NMSQT as one additional external testing program. Advantages and disadvantages of such a proposal are cited.—S. Kavruck.

Aptitudes

7181. Camp, W. L., & Rothney, J. W. M. (U. Wisconsin) Use of the Concept Mastery Test in study of superior high school seniors. *Voc. Guid. Quart.*, 1962, 10(4), 223-225.—In 1960-61, the CMT was administered by the Guidance Laboratory at the University of Wisconsin to all 12th-grade students referred. This was a superior group, falling within the top 1st percentile on the verbal section of SCAT and within the top 6th percentile on the quantitative section. 100 students were chosen at random from this group and a questionnaire study was completed concerning a wide variety of biographical facts. High CMT scorers tended to come from professional homes and from large urban schools; they prefer communications and mathematics subjects to other areas of study. Boys planning graduate work after college graduation scored higher than those without such plans, but this difference was not found for girls.—W. L. Barnette, Jr.

7182. Mukherjee, B. N. (U. North Carolina) The factorial structure of aptitude tests at successive grade levels. *Brit. J. statist. Psychol.*, 1962, 15(1), 59-65.—Research was designed "to verify the alleged differentiation in mental abilities reported by earlier factorists. Correlations for eight tests applied to boys and girls in grades 8 to 12 have been factorized by the method of principal axes and then rotated by the varimax method. Coefficients of similarity have also been calculated for the several groups. In general, the hypothesis of differentiation is confirmed; but in certain minor respects the results obtained seem to diverge appreciably from the conclusions reached by previous investigators." (16 ref.)—N. Earl.

7183. Willingham, W. W., & Strickland, J. A. (Georgia Inst. Technology) Conversion tables for Otis Gamma and Scholastic Aptitude Test. *Personnel Guid. J.*, 1962, 41(4), 356-358.—Based on a sample of 403 students equivalency scores are presented for Otis Gamma and Scholastic Aptitude Test

and a table showing predicted scholastic aptitude test scores based on Otis IQs.—S. Kavruck.

Achievement

7184. Cline, Victor B., Richards, James M., Jr., & Abe, Clifford. (U. Utah) The validity of a battery of creativity tests in a high school sample. *Educ. psychol. Measmt.*, 1962, 22(4), 781-784.—"These results indicate that the creativity tests in this battery do have considerable validity as predictors of academic performance, and that the criterion variance accounted for by the creativity tests is to a substantial degree independent of the variance accounted for by the IQ test."—W. Coleman.

7185. Davids, Anthony, & Sidman, Jack. (Brown U.) A pilot study: Impulsivity, time orientation, and delayed gratification in future scientists and in under-achieving high school students. *Except. Children*, 1962, 29(4), 170-174.—20 intellectually superior, highly successful high school boys were compared with 10 intellectually superior but underachieving boys. "... boys in the high achieving group were (a) less impulsive and more able to inhibit their responses in a situation that called for motor control; (b) more future oriented in their phantasies and imaginal processes; and (c) less concerned with immediate gratifications and better able to plan for future goals." No differences were found in ability to estimate passage of brief intervals of time.—J. Z. Elias.

7186. Drake, L. E. (U. Wisconsin) MMPI patterns predictive of under-achievement. *J. counsel. Psychol.*, 1962, 9(2), 164-167.—For male freshmen in the upper ½ of college aptitude tests "the pattern 49 is the important differentiating factor and ... scale 5 acts as a supressor variable."—E. R. Oetting.

7187. Gayen, A. K., Nanda, P. B., Mathur, R. K., Dubey, S. D., Duari, P., & Bhattacharyya, N. (Indian Inst. Technology, Kharagpur, West Bengal) Measurement of achievement in mathematics: A statistical study on effectiveness of board and university examinations in India. New Delhi, India: Government of India, Ministry of Education, 1961. (Res. Proj. Exam. Rep. No. 1) vii, 176 p.—A detailed analysis is made of the questions and answers given by a sample of 3717 pupils on a secondary school final examination in compulsory mathematics, consisting of short problems (with options) in arithmetic, algebra, and plane geometry. Appropriateness of concepts in relation to syllabus, split-half reliability, item-whole internal consistency, and difficulty of questions are evaluated. Distributions of total scores are compared with distributions of scores in languages. A more advanced mathematics examination is also briefly analyzed. A critique of public examinations in India and recommendations for improvement based on this study are given. (40-p. appendices; 14-p. index, glossary, & ref.)—J. T. Cowles.

7188. Hopkins, Kenneth D., Dobson, James C., & Oldridge, O. A. (U. Southern California) The concurrent and congruent validities of the Wide Range Achievement Test. *Educ. psychol. Measmt.*, 1962, 22(4), 791-793.—Using teacher's ratings of reading proficiency as the criterion, concurrent validity r's were computed for the Wide Range Achievement Tests given in Grades 1 through 5. The r's

obtained ranged from .74 to .86. Similar r 's were secured from the California Reading Test.—*W. Coleman*.

7189. Jones, Reginald L., & Siegel, Laurence. (Miami U.) The individual high school as a predictor of college academic performance. *Educ. psychol. Measmt.*, 1962, 22(4), 785-789.—"The results of the study are interpreted as supporting the initial hypothesis that significant improvements in predicting college grades are made when data from each originating high school are treated separately."—*W. Coleman*.

7190. Kitano, Harry H. L. (U. California) Changing achievement patterns of the Japanese in the United States. *J. soc. Psychol.*, 1962, 58(2), 257-264.—A study of achievement through grade point averages and social participation through membership in organized school activities was made on Japanese high school students in the United States. The data indicate a gradual drop in achievement by year from 1941 through 1959. Conversely, social participation has increased for this group, especially among the females. The findings were interpreted to indicate (a) the role of acculturation whereby the Japanese group through several generations in the United States becomes acculturated to the prevailing norms of the larger society, even if the behavior means acculturating "downward" in school achievement and (b) the opportunities available in the high school social system whereby the Japanese student because of increased opportunities to participate socially in the high school system is changing from emphasis on achievement to one on social participation.—*Author abstract*.

7191. Krippner, S. (Kent State U.) Sex, ability and interest: A test of Tyler's hypothesis. *Gifted Child Quart.*, 1962, 6(3), 105-110.—Tyler hypothesized that vocational interest was related to mental ability in boys only. To test this, 357 7th and 8th graders were grouped as high or low achievers on the basis of scores on the Iowa Every Pupil Test (IEP) and as high or low capacity on the basis of scores on the Primary Mental Abilities Test (PMA). A scholastic and vocational interest questionnaire was administered, too. High IEP and PMA boys differed significantly from the low on all items on the questionnaire. High IEP girls differed from low on 2 items only, but high PMA girls differed from the low on no items. These data are offered in support of the hypothesis.—*N. M. Chansky*.

7192. Kundu, Ramanath. (Calcutta, India) An investigation in the prediction of school success. *Indian J. Psychol.*, 1962, 37(2), 75-83.—First-order correlations with S grades and with final achievement in secondary school, and multiple correlation with final achievement, are presented for 3 types of intelligence test. Ss were 58 students, 11-17 years of age. Significant positive correlations were generally found for a test of selected Terman-Merrill items and a locally devised, omnibus verbal-quantitative test. A combination of these 2 intelligence tests appeared to be an effective predictor of school achievement at this level.—*J. T. Cowles*.

7193. Lang, G., Sferra, A. G., & Seymour, M. Psychological needs of college freshmen and their academic achievement. *Personnel Guid. J.*, 1962, 41(4), 359-360.—Using the Edwards Personal Pref-

erence Schedule to determine needs, the EPPS variables can differentiate between low and high achieving freshmen.—*S. Kavrick*.

7194. Littig, Lawrence W., & Yeracaris, Constantine A. (U. Buffalo) Academic achievement correlates of achievement and affiliation motivations. *J. Psychol.*, 1963, 55(1), 115-119.—Academic achievement level, n Achievement scores, and n Affiliation scores were obtained from a probability sample of 190 men and 206 women residing in a small upstate New York community as part of a study of the effects of community-wide educational television on attitudes toward education. Need Achievement was positively related to academic achievement among men but not among women. Need Affiliation was not related to academic achievement for either sex. Implications were drawn from these findings regarding: (a) the validity of the thematic apperceptive measure of n Achievement, (b) the relevance of n Achievement to academic success.—*Author abstract*.

7195. Mitchell, Blythe C. (Harcourt, Brace & World Inc.) The Metropolitan Readiness Tests as predictors of first-grade achievement. *Educ. psychol. Measmt.*, 1962, 22(4), 765-772.—The Metropolitan Readiness Tests had predictive validities ranging from .61 to .63 with the 4 subtests of the Metropolitan Achievement Battery. The data were obtained from 1170 1st-grade students in a Virginia school system.—*W. Coleman*.

7196. Mitra, S. K. Validity of medical selection tests. *J. voc. educ. Guid.*, Baroda, 1961, 7(3), 113-124.—Analysis of a battery of psychological tests ("g," abstract reasoning, English usage, science achievement, etc.) administered to 50 students attending Christian Medical College, Vellore, India, where the criterion was the average of 8 examination marks from the first year's work. Best predictors were a speeded test of general ability, biology, and English usage. R of .7 was obtained. Factor analysis showed that much more than scholastic aptitude was involved in medical school success in this study.—*W. L. Barnette, Jr.*

7197. Mogar, Robert E. (Pennsylvania State U.) Competition, achievement, and personality. *J. counsel. Psychol.*, 1962, 9(2), 168-172.—Females who show improvement on the block design test under competition, score higher on Succorance and Dominance on EPPS, the differences for males are not significant. Relations between scales and course grades are also indicated.—*E. R. Oetting*.

7198. Parsley, Kenneth M., Jr., & Powell, Marvin. (U. Alabama) Achievement gains or losses during the academic year and over the summer vacation period: A study of trends in achievement by sex and grade level among students of average intelligence. *Genet. Psychol. Monogr.*, 1962, 66(2), 285-342.—1080 students, grades 2 through 7, were given the California Achievement Test Batteries in the early fall, late spring, and early fall of the following year. Difference scores for over the academic year and summer were obtained, and the various hypotheses were tested by t at the .05 level of confidence. Significant differences between the sexes and between grade levels appeared in each of the 6 subject matter areas. In general, summer gains increase with age. Summer gains tend to be greater for reasoning and judgmental items than for

specific drill items (such as spelling and arithmetic fundamental which may show a loss.—*E. Borrowman*.

7199. Payne, David A. (Syracuse U.) **The concurrent and predictive validity of an objective measure of academic self-concept.** *Educ. psychol. Measmt.*, 1962, 22(4), 773-780.—An objective theory-based measure of academic self-concept, the Word Rating List (WRL), was devised for predicting academic achievement. With the exception of under-achievers, the WRL provided significant concurrent and predictive *r*'s with grade point average.—*W. Coleman*.

7200. Roby, A. Richard. **A study in the correlation of music theory grades with the Seashore Measure of Musical Talents and the Aliferis Music Achievement Test.** *J. Res. music Educ.*, 1962, 10(2), 137-142.—77 Ss who completed the 2-year course in music theory at the University of Minnesota showed "a strong relationship between Aliferis test scores and theory grades, fair relationship in the instances of the English Entrance and ACE tests, and no relationship between the theory grades and the Seashore battery scores."—*D. S. Higbee*.

7201. Saffirio, L. **Profitto scolastico di minorenni travati.** [Scholastic performance of deviant minors.] *Riv. Psicol. soc.*, 1962, 29(2), 187-195.—There is a significant differences between grades received by children in average classes and children in special classes in a center for reeducation of minors.—*L. L'Abate*.

7202. Seegars, James E., Jr. (U. Kentucky) **A further investigation of an M.M.P.I. scale for predicting college achievement.** *Personnel Guid. J.*, 1962, 41(3), 251-253.—Using female Ss, upperclassmen, and matched IQs, no significant results were found for the Hackett Z scale in predicting college achievement.—*S. Kavruck*.

7203. Sharp, Bert L. (Auburn U.) **College achievement: Its relationship to high school achievement experiences and test scores.** *Personnel Guid. J.*, 1962, 41(3), 247-250.—The study suggests that amount of study, measured in years which a student takes in a particular subject, has no significant effect or direct bearing upon the grade that a student makes in the same subject in the 1st year of college when level of performance on placement test is controlled. Significant relationships between placement test scores and college grades do exist.—*S. Kavruck*.

7204. Università di Firenze, Istituto di Psicologia. **Sulla prevedibilità del successo nella scuola primaria.** [On the prediction of success in the primary school.] *Florence, Italy: UFIP*, 1961. 109 p.—This pilot investigation focused on intensive study of a small sample demonstrates the effectiveness of an exhaustive analysis of 68 children (32 male and 36 female between ages of 5.3 and 6.2) in establishing criteria for prediction of scholastic success. A follow-up with a larger sample is called for. Authors and general topics of subreports included are: Gina F. Mori (psychological investigations on the prediction of scholastic difficulty and medical examinations); Anna Pinucci (family characteristics) such as socioeconomic factors and attitudes); Dora P. Giovannini (the school record—character, attendance, and intelligence); Corado Coradeschi (physical growth in relation to psychological characteristics);

Maria Gandi (Goodenough Draw-a-Man and "drawing of my family"); and finally an introduction and conclusion by Alberto Marzi, Director of the Institute. (53 ref.)—*G. M. Della-Piana*.

7205. Vick, Mary Catharine, & Hornaday, John A. (Greensboro Coll.) **Predicting grade point average at a small southern college.** *Educ. psychol. Measmt.*, 1962, 22(4), 795-799.—Predictors used were the Scholastic Aptitude Test, SCAT, Cooperative English Test, and high school rank. Part scores for the tests were included in computing a multiple R. However, the best predictors were high school rank and the English test. On a cross-validation study using these 2 predictors, an R of .63 was obtained.—*W. Coleman*.

EDUCATIONAL PERSONNEL

7206. Anderson, Harold H., & Anderson, Gladys L. (Michigan State U.) **Social values of teachers in Rio de Janeiro, Mexico City, and Los Angeles County, California: A comparative study of teachers and children.** *J. soc. Psychol.*, 1962, 58(2), 207-226.—The Anderson Incomplete Stories were administered to 7th-grade children in Rio de Janeiro, Mexico City, and continental United States. Teachers in the "Ideal Group" in Rio de Janeiro, Mexico, and Los Angeles County completed the stories in a way that was "best for all persons in the story"; teachers in the "control group" completed the stories as they thought 7th-grade children would finish them. Findings on 2 stories, generally consistent with hypotheses which grew out of research on dominative and socially integrative teacher-child relations, are interpreted in terms of cultural values and social creativity.—*Author abstract*.

7207. Bolman, Jr., Frederick de W. (Franklin & Marshall Coll.) **Placing America's highly skilled manpower: College faculty and administrators.** *Educ. Rec.*, 1962, 43(4), 295-300.—Problems in finding and distributing talent to meet the increasing educational demand in higher institutions are discussed. Dangers and opportunities are outlined in 5 steps: recognition of an opening, scouting, screening, interviewing, and selection. A new concept in placement of academic personnel is needed which should look not only toward problems of replacement, but also toward problems of growth.—*W. W. Meissner*.

7208. Dave, I. (Teachers' Coll., Udiapur, Rajasthan) **Personal problems of prospective teachers.** *J. voc. educ. Guid., Baroda*, 1961, 7(4), 194-200.—Analysis of the responses of 67 male and 20 female teacher trainees to the Mooney Problem Checklist (Adult Form). The author notes it required much persuasion to secure the cooperation of these Indian women. The article discusses the nature, distribution, and comparative status of the problems checked by these Ss (economic security was Rank 1).—*W. L. Barnette, Jr.*

7209. Deb, Maya. (Delhi, India) **A study of temperamental qualities necessary for teaching profession at the university level.** *Indian J. Psychol.*, 1962, 37(1), 39-44.—Results are presented from a questionnaire concerning the desirability of each of 25 temperamental qualities of an effective teacher. The questionnaire was distributed to the chief university administrator, deans of faculties, and heads of de-

partments of psychology and education in 33 universities in India. Respondents numbered 47 (27%) of this sample of about 175.—J. T. Cowles.

7210. Greene, James E., Sr. (U. Georgia) A comparison of certain characteristics of white and Negro teachers in a large Southeastern school system. *J. soc. Psychol.*, 1962, 58(2), 383-391.—Comparisons of white and Negro teachers in a large southeastern school system were based on the following data: personal and family background, 14 variables; training, 10 variables; experience, 13 variables; National Teacher's Exam (NTE) scores, 6 variables. In all NTE categories Negroes made reliably and markedly lower scores than whites, although Negroes reported higher levels of training and certification and had higher mean salaries than whites.—*Author abstract.*

7211. Kundu, Ramnath, & Banerjee, Debabrata. Some psychological aspects of college teachers' personalities: An experimental study. *Indian J. soc. Wk.*, 1961, 22(3), 247-252.—100 college teachers answered a 2-part questionnaire. There were 7 census items and 26 questions bearing on their personality. Results concerning such factors as self restraint at exciting situations, ease of picking up new acquaintances, and bidding orders to others are given in percentages.—R. Schaefer.

7212. Long, Nicholas J., Cook, Anne R., Evans, Ellis D., Kerr, Joan, Linke, Linda A., Neubauer, Barbara, & Payne, David C. (Indiana U.) Groups in perspective: A new sociometric technique for classroom teachers. *Bull. Sch. Educ. Ind. U.*, 1962, 38(6), 1-112.—A guide to the administration and use of the L-J Sociometric Test.—R. E. Schutz.

7213. Pace, Walter Thomas. (Wayne State U.) Profiles of personal needs and college press of Negro teacher trainees. *Dissert. Abstr.*, 1962, 22(10), 3748-3749.—*Abstract.*

7214. Sillers, Dan J. (U. Denver) Administrators' perceptions of discipline in selected institutions of higher education. *Dissert. Abstr.*, 1962, 22(11), 4076-4077.—*Abstract.*

7215. Steffire, B., & Leafgren, F. (Michigan State U.) Value differences between counselors and administrators. *Voc. Guid. Quart.*, 1962, 10(4), 226-228.—The senior author's Vocational Values Inventory was administered to 23 school administrators (all working for advanced degrees) and 40 counselors who were members of a guidance institute. The VVI is a forced-choice type inventory yielding 7 value measures: altruism, control, job freedom, money, prestige, security, self-realization. Rho was .86 for the 2 groups; the major difference was in the value of control which counselors ranked 5th and administrators ranked 3rd.—W. L. Barnette, Jr.

7216. Twyman, J. Paschal, & Biddle, Bruce J. (Oklahoma State U.) Role conflict of public school teachers. *J. Psychol.*, 1963, 55(1), 183-198.—This paper reports an empirical investigation of role conflict for public school teachers. Data were based on a comparison of cognitions held for selected teacher behaviors by members of 4 school related social positions. 98 teachers, 261 parents, 237 pupils, and 67 school officials were interviewed and their norms and expectations for "teachers in general" analyzed. Numerous cognitive disparities were found

for both norms and expectations. The greatest number of disparities occurred when comparing pupils with all other adults and when comparing parents with the professional interest groups (teachers and school officials). Most of the disagreements among positions centered on behaviors related to teacher self-indulgence, maintenance of order, and community participation.—*Author abstract.*

INDUSTRIAL & MILITARY PSYCHOLOGY

7217. Gagne, R. M. (Ed.) (Princeton U.) *Psychological principles in system development*. New York: Holt, Rinehart & Winston, 1962. xiv, 560 p. \$9.00.—A collection of 14 papers describing systematic application of psychological principles and techniques to man-machine system development. After a summary introduction of planning for inclusion of human components, separate chapters are devoted to such topics as: human capabilities and limitations, task description and analysis, selection and classification of personnel, aids to job performance, individual and team training, requirements for training devices, and teaching devices, and techniques for assessing human and system performance.—K. J. Hartman.

7218. Human Resources Research Office. *HumRRO work program: Fiscal Year 1963*. Washington, D. C.: HumRRO, 1962. 109 p.—10 functional areas in which the Human Resources Research Office will operate in 1963 are: equipment maintenance, equipment operation, individual combat skills, team combat skills, leadership, decision making, motivation and stress, remote area operations and language, training management, and training technology. Definitions, tasks, exploratory studies, and basic research in each area are outlined. Suggestions for additional research to improve Army training are invited.—R. Tyson.

7219. Oshanin, D. A. *Psychologia a badanie układow automatycznych*. [Psychology and the study of automatic systems.] *Psychol. wych.*, 1962, 5(3), 261-280.—The article discusses some of the psychological implications of automation. The basic error committed by industrial psychologists is that of reducing the individual to a "information-decision-action" model. The factor of human "multi-stimuli" should be considered in the design and operation of automatic systems.—H. Kaczkowski.

7220. *Personnel Practice Bulletin. Index: 1945-61. Personnel Pract. Bull.*, 40 p.—Articles appearing during the years indicated are indexed under subject matter headings and by author. Organizations which have contributed articles and those which have participated in research are listed.—J. L. Walker.

7221. Sells, S. B. (Texas Christian U.) *La investigación astronáutica y algunas de sus implicaciones en problemas humanos*. [Astronautical research and some of its implications for human problems.] *Rev. Psicol. gen. apl.*, 1961, 17(Whole No. 58), 241-257.—The "space age" is not potential, but already present, and will have major impact upon humanity. This impact will be scientific, legal and political, economic, educational, cultural, psychological, and even biological. "Liberated from gravity, man could develop capacities not conceived of before now." (15 ref.)—E. B. Page.

VOCATIONAL GUIDANCE & APTITUDES

7222. Barry, Ruth, & Wolf, Beverly. Epitaph for vocational guidance: Myths, actualities, implications. New York: Teachers College Columbia Univ., 1962. ix, 241 p. \$4.75.—Part I analyzes myths regarding: the adequacy of theory underlying vocational guidance, the use of tests to measure significant facets of personality, the adequacy of current schemes of classifying occupations, the significance of vocational information, and realism and reality testing in vocational choice. Part II considers actualities of significance to vocational guidance including: increased population; urbanization; and emergence of larger and more complex units within business, industry, and education; phenomena within the labor force such as automation, the labor force pyramid, the working woman, the retired worker, increased leisure, and changing roles within our society; problems confronting special groups such as adolescents, unneeded workers, and member of minority groups; and changes in our values regarding work. Part III is concerned with the implications of these changes for future vocational guidance.—C. H. Miley.

7223. Geist, Harold. A five year follow-up of the Geist Picture Interest Inventory. *Calif. J. educ. Res.*, 1962, 13(5), 195-208.—5 years after taking the GPII, all locatable testees who had taken it were queried as to their occupational history. Answers were returned by 148 of the original United States mainland, 115 of 332 Hawaii, and 26 of 340 Puerto Rico testees. Comparison of occupational history with earlier interest choices led to the conclusions: (a) "In the mechanical, scientific and outdoor areas, practically all the testees did not engage in any work outside their respective area." (b) "Evidently those testees who are currently in the kind of work for which they originally expressed the greatest inventoried interest do not shift into different kinds of jobs in the early stages of their occupational career." (c) "According to the criteria of current work and/or major in college, the clerical, mechanical, scientific, computational, and artistic scales are highly valid; the outdoor, literary, and social service scales moderately so; and the persuasive and dramatic scales not at all valid." (d) There appears to be profile independence among the various occupational groups. (e) The percentages of youngsters in the Puerto Rican and Hawaiian groups who went into the professions far outstrips those on the mainland.—T. E. Newland.

7224. Hadley, Robert G., & Levy, William V. (VA Cent., Los Angeles, Calif.) Vocational development and reference groups. *J. counsel. Psychol.*, 1962, 9(2), 110-114.—A theoretical discussion of the role of reference groups in vocational development, calling attention to the relationship of these concepts to Super's theory.—E. R. Oetting.

7225. Hutson, P. W. (U. Pittsburgh) Vocational choices, 1930 and 1961. *Voc. Guid. Quart.*, 1962, 10(4), 218-222.—A replication of the author's 1930 study in 1961 where career choices of high school students are compared along with IQ estimates and reasons for career choice. Data for 1961 involve 2744 students from 24 schools in western Pennsylvania. The preponderance of choices for professional occupations is discouragingly apparent (38-65%, depending on high school level and sex). This suggests

that guidance for vocational choice has not become more effective over these 3 decades. Regarding intellectual level, the 1961 data suggest that students choose occupations with very little regard for this particular aptitude and, compared to 1930 data, there is little change. The author concludes that many of the 1961 students are remaining in the fantasy stage of vocational selection.—W. L. Barnette, Jr.

7226. Kinnane, John F., & Suziedelis, Antanas. (Catholic U. America) Work value orientation and inventoried interests. *J. counsel. Psychol.*, 1962, 9(2), 144-148.—The Work Values Inventory is highly related to SVIB categories. "... values can be more meaningfully related ... [when] drawn from the vocabulary of the world of work."—E. R. Oetting.

7227. Linares Maza, A. (Málaga, Spain) Problemas de vocación y orientación profesional. [Problems of vocational selection and guidance.] *Rev. Psicol. gen. apl.*, 1961, 16(Whole No. 58), 287-305.—Extensive study of vocational interests is said to be of maximum psychological, scientific, and practical value. Centers in Spain are urged to prepare appropriate investigatory tests and questionnaires, and explanatory pamphlets, films, and other media. (26 ref.)—E. B. Page.

7228. McCarthy, Mary Kieran, & McCall, Raymond J. (Briarcliff Coll.) Masculinity faking on the FM scale of an interest inventory. *Personnel Guid. J.*, 1962, 41(4), 346-349.—The Strong Vocational Interest Blank for Women was given twice to 40 religious women to determine the effect of faking masculinity on the FM scale. The mean of the FM standard score was lowered significantly. 15 other occupational scale scores were also changed significantly on the second taking. The Lawyer scale showed the greatest increase, the Elementary Teacher scale, the greatest decrease.—S. Kavruk.

7229. Mehta, H. P. (Ministry Labour, New Delhi) Work values and guidance. *J. voc. educ. Guid.*, Baroda, 1961, 8(1), 1-12.—Presidential Address at the 6th Annual Conference of the All-India Educational and Vocational Guidance Association, September 1961. Research on basic issues of guidance, apart from test construction, is in an infantile stage in India. The work values of the individual also greatly effect productivity, as do interests and abilities. Several general dimensions of work values are outlined, mostly based on the author's observations of workers in government offices (examples: initiative, identifying with the agency's objectives). Several American researches are cited but with the admonition that these should be checked under Indian conditions.—W. L. Barnette, Jr.

7230. Overs, R. P. (Cleveland, O., Rehabilitation Centr.) Vocational counseling: Miscellaneous impressions of the informal system. *Voc. Guid. Quart.*, 1962, 10(4), 190-195.—A subjective, sociological analysis of the salient features in the behaviors of the vocational counselor in terms of his adaptations to the formal structure of the job. Success with clients is an important goal. Counselors form a very close-knit group and few trade secrets are withheld. One manifestation of status is who has access to what records along with framed certificates on the wall. Private phones and tape recorders also provide status symbols. One of the myths of counselors is the feeling they have more influence on lives of clients than

they actually have. Confidentiality among counselors concerning clients is typically ignored and is used for self-improvement of status. More awareness of these informal relationships is essential to counselor effectiveness.—*W. L. Barnette, Jr.*

7231. Stodkin, Bruce Carlyle. (U. Buffalo) An empirical investigation of two basic assumptions of a theory of vocational choice. *Dissert. Abstr.*, 1962, 22(7), 2469-2470.—*Abstract.*

7232. Super, D. E. (Columbia U.) The self concept in vocational development. *J. voc. educ. Guid.*, Baroda, 1961, 8(1), 13-29.—A paper presented at the 6th Annual Conference of the All-India Educational and Vocational Guidance Association, September 1961, wherein the author traces the historical development of the concept of vocational development as the implementation of a self concept, the roots of which go back to the work of Carter and Bordin in 1940 and 1943, respectively. The basic elements of a self concept theory are: self-exploration, self-differentiation, identification, role playing, reality testing, translation of the self-concept into occupational terms, and the final implementation of the self-concept (as on the 1st job).—*W. L. Barnette, Jr.*

OCCUPATIONAL & CAREER INFORMATION

7233. Chatterjea, R. G., & Mullick, Jaladhar. Interest pattern of persons engaged in engineering and medical profession. *Indian J. soc. Wk.*, 1961, 22(3), 209-215.—80 engineers and 110 physicians were surveyed using a questionnaire of the L-I-D type. Items included 48 occupations, 41 amusements, 41 curricular subjects, 19 activities, and 23 personality types. L-I-D percentage data are reported and it is concluded that both groups differ so far as activities and personality types are concerned, and show resemblance in the remaining 3 categories.—*R. Schaef.*

7234. Eckerson, A. B. (United States Dept. Labor) The new "Dictionary of Occupational Titles": Its implications for guidance. *Voc. Guid. Quart.*, 1962, 10(4), 202-204.—Summary article about the 3rd edition which goes to press in 1963 where obsolete jobs have been deleted and approximately 6000 new job titles will appear. The number of professional and technical workers has doubled in recent years and the new edition will reflect such changes. Volume 1 will list job definitions alphabetically and classified by a 6-digit code. This code will also identify the section in Volume 2 where worker traits and related requirements are stated. Volume 2, being job-oriented, has many vocational counseling applications, but it is also individual-oriented to indicate with what the actual work is involved (as with people, things, data, etc.). Volume 2 will therefore have both placement and guidance uses.—*W. L. Barnette, Jr.*

7235. Katz, Fred E., & Martin, Harry W. (U. Missouri) Career choice processes. *Soc. Forces*, 1962, 41(2), 149-154.—Occupational choice may be viewed "as the cumulative product of a series of specific acts, which may or may not be directly focused upon a deliberate career choice." Data from student nurses studied from admission to graduation support this view in that one's decision to become a nurse, for example, may be based upon the desire to remain near young, eligible physicians or near a friend of the same sex.—*A. R. Howard.*

7236. Kriesberg, Louis, & Beale, Lathrop V. (Syracuse U. Youth Development Cent.) Career specifications among medical students. *J. Hlth. hum. Behav.*, 1962, 3(3), 204-212.—In order to determine why more medical students decide to specialize rather than go into research, 1086 students at various stages in medical school were interviewed. "... cognitive learning and rational consideration of one's own resources, of the nature of medical practice, and of esteemed career alternatives are of more importance than learning new values about medical practice. The data do not permit proving this thesis but they are consistent enough to suggest that at least for the population examined, changes in career-relevant values follow rather than lead changes in career choices."—*L. A. Ostlund.*

7237. Miller, Sutherland, Jr. (Columbia Coll.) Relationship of personality to occupation, setting, and function. *J. counsel. Psychol.*, 1962, 9(2), 115-121.—A biographical questionnaire including items from the MMPI and the EPPS is used to measure 13 personality characteristics, related differentially to job setting and job function.—*E. R. Oetting.*

7238. Osipow, Samuel H. (Pennsylvania State U.) Perceptions of occupations as a function of titles and descriptions. *J. counsel. Psychol.*, 1962, 9(2), 106-109.—Using semantic differential, differences in attitude towards job titles are found on evaluative and potency dimensions. These may be reduced by providing occupational descriptions.—*E. R. Oetting.*

7239. Rahudkar, Wasudeo. (Coll. Agriculture, Nagpur, India) The relationship of certain factors to the success of village level workers. *Rural Sociol.*, 1962, 27(4), 418-427.—A village level worker serves 10 villages as a joint agent for development activities and as "guide, philosopher, and friend" to the inhabitants. The most effective workers were aged 31-40, high school graduates (but not college), married, and of rural background.—*H. K. Moore.*

7240. Rauner, Therese M. (Ladycliff Coll.) Occupational information and occupational choice. *Personnel Guid. J.*, 1962, 41(4), 311-317.—The study sought to determine relationships between amount of knowledge of chosen occupations and curriculum, class, age, high school, and occupation chosen. Ss included 186 college juniors and seniors. Significant relationships were found between mental ability and occupation chosen or between high school and "knowledge." The need for more information about occupations was indicated.—*S. Kavruck.*

7241. Simmons, Dale D. (Oregon State U.) Children's rankings of occupational prestige. *Personnel Guid. J.*, 1962, 41(4), 332-336.—4th-grade boys show a high degree of agreement with adults as to the prestige of occupations ($\rho = +.868$). With girls, agreement does not develop until Grade 8. Group prestige hierarchies show stability over a 2-month period. Occupations ranked high in prestige tend to be ranked high in interest.—*S. Kavruck.*

SELECTION, PLACEMENT, APPRAISAL

7242. Bayroff, A. G. Methods for improving enlisted input: Status report. *USA Personnel Res. Off. OCRD. tech. res. Rep.*, 1962, No. 1125. 15 p.—To meet the continuing requirement under Congress-

sional legislation and Department of Defense policies for procedures to screen armed services input, major research emphasis during 1962 was placed on: (a) evaluation of an interim differential aptitude measure—Army Qualification Battery (AQB-1); (b) standardization of new tests for the Army Qualification Battery; (3) construction and standardization of a differential aptitude battery for the Women's Army Corps—the Women's Army Classification Battery (WACB)—and standardization of new forms of the Armed Forces Women's Selection Test (AFWST 5-6) and Women's Enlistment Screening Test (WEST 3-4) in collaboration with the Air Force; (d) exploring feasibility of short, limited-range tests to predict pass-fail at the 31st percentile on AFQT, current standard for enlistment in the Army; (e) devising a reliable method of estimating mental abilities in the civilian manpower pool eligible for military service; and (f) planning for sampling current AFQT data. New forms of the AQB were prepared for implementation on July 1st, 1962. Research findings led to operational use of the women's tests, AFWST 5-6, WEST 3-4, and WACB in late 1961.—A. J. Drucker.

7243. Demaree, Robert G., Marks, Melvin R., Smith, Walter L., & Snyder, Melvin T. (Matrix Corp.) Development of qualitative and quantitative personnel requirements information. *USAF AMRL tech. docum. Rep.*, 1962, No. 62-4. v, 82 p.—This report describes the nature of, purpose, and method for developing Qualitative and Quantitative Personnel Requirements Information (QQPRI). The report is intended to aid Air Force, and contractor personnel in the development and use of QQPRI. The 1st section of the report covers the nature and scope of QQPRI and relationship of QQPRI to system development. The 2nd section describes the general constraints within which QQPRI is developed. Such constraints include technical weapon system constraints as well as policies on Air Force personnel, training, and manning. The 3rd and largest section covers QQPRI development techniques such as task analyses, estimation of performance time, establishing Air Force positions and determining the relation of these to existing Air Force specialties. The 4th section covers the QQPRI report, its preparation and uses. (21 ref.)—*USAF AMRL*.

7244. Doll, R. E., & Longo, A. A. (USN. School Aviation Medicine) Improving the predictive effectiveness of peer ratings. *Personnel Psychol.*, 1962, 15(2), 215-220.—Low scores on peer ratings of leadership potential have been shown to predict failure to complete the Naval Air Training Program. It is hypothesized that low peer ratings awarded by reason of "anti-social" personality traits are invalid as predictors of training failure and reduce the predictive effectiveness of low peer ratings. Of 278 low-rated cadets, the 73 identified as having been low-rated for "anti-social" reasons included significantly fewer failures to complete training than did men low-rated for other reasons.—A. S. Thompson.

7245. Dronkers, P. L. Appraisal of personnel for staff development and salary review: A European experience. *Personnel pract. Bull.*, 1962, 18(4), 1-14.—The Director of the International Personnel and Industrial Relations Department of N. Y. Philips (Netherlands) describes and discusses 2½

years of midyear appraisal and progress review. Its ultimate value is dependent upon the people who use it.—J. L. Walker.

7246. Elson, Jo Ann. Abstracts of personnel research reports: III. 1962. *USAF PRL tech. docum. Rep.*, 1962, No. 62-27. iii, 8 p.—This volume includes abstracts of the 27 technical documentary reports issued by the 6570th Personnel Research Laboratory in 1962. They cover studies in selection, classification, and utilization of Air Force personnel, systematizing information flow in support of personnel planning; methods of describing, evaluating, and structuring Air Force jobs; and development of procedures for improving the quality of Air Force personnel.—*USAF PRL*.

7247. Helme, W. H., & Katz, A. Attrition reduction task: Status report. *USA Personnel Res. Off. OCRD. tech. res. Rep.*, 1962, No. 1124. 13 p.—Improvement of procedures for identifying men who will succeed in training for critical jobs and technical specialties, the primary objective of the Attrition Reduction Task, has been expanded during 1962 through pursuit of 3 separate, but related, research approaches. Continuing evaluation of operational effectiveness of Army Classification Battery measures and aptitude area composites, data on prediction of success collected in over 100 military occupational specialties (MOS) formed the basis for intensive research on the problems of differential classification and manpower allocation. A number of exploratory investigations were conducted on problems of attrition in operational settings, and a pilot study was designed to analyze motivational and personality factors related to this problem. A study was also undertaken to determine whether, in event of mobilization, women could be used in job areas where their assignment is not now authorized and where critical manpower shortages are likely to occur; findings established a number of suitable jobs in electronics and electrical maintenance MOS.—A. J. Drucker.

7248. Helme, W. H., & Waters, L. K. New classification techniques: Status report. *USA Personnel Res. Off. OCRD, tech. res. Rep.*, 1962, No. 1126. 19 p.—New classification techniques research is concerned with maintaining and improving the effectiveness of the Army Classification Battery (ACB)—with emphasis on developing measures of human factors not yet provided by the ACB, including measures of physical proficiency, techniques for identifying career-oriented personnel during initial classification, and measures to evaluate the potential usefulness of Category 4 enlisted men. Updated new alternate forms of the Automotive Information and Army Clerical Speed tests of the ACB became operational in January, 1962. A tool knowledge test and 2 trade knowledge tests, designed to afford better differential prediction within the mechanical domain, have progressed to the validation stage. 2 information tests—in biochemistry and chemistry—have been constructed as a means of differentiating performance in medical and chemical military occupational specialties (MOS) from other MOS now selected in the general technical aptitude area. Reenlistment prediction studies are also described.—A. J. Drucker.

7249. Hogue, J. P., Otis, J. L., & Prien, E. P. (U. Montreal, Canada) Assessments of higher-level personnel: VI. Validity of predictions based on

projective techniques. *Personnel Psychol.*, 1962, 15 (3), 335-344.—A factor analysis of predictor-criterion scores revealed that clinicians analyzing projective material did not evaluate in the same psychological space as supervisors providing performance evaluations. Separate analyses indicated that predictor and criterion raters used the rating form consistently and obtained factors which are similar in name. Correlations of predictor ratings with paper-and-pencil test scores tend to confirm the constructs implied by the predictor factors. Scores on the Guilford-Zimmerman reflected personality measures similar to those obtained from the analysis of projective material. However, the Edwards Personal Preference Schedule appeared to measure something considerably different from that measured or revealed by the analysis of projective materials.—A. S. Thompson.

7250. Hoisman, Alan Jay. (Purdue U.) **Validation of a personnel test for executive selection.** *Dissert. Abstr.*, 1962, 22(7), 2458.—Abstract.

7251. Horváth, I. G. (Budapest, Hungary) **Doležitost psychologických skúšok pri posudzovaní spôsobilosti v doprave.** [The importance of psychological examinations in investigating ability in transport.] *Psychol. Stud.*, Bratislava, 1961, 3, 135-156.—Experiences in Hungary show that information gained from general medical examinations, from examination of the physiology of perception, and from personality tests, allow conclusions as to the prediction in practice with a great probability. Russian & English summaries—V. Břicháček.

7252. Huse, E. F. (Raytheon Corp.) **Assessments of higher-level personnel: IV. The validity of assessment techniques based on systematically varied information.** *Personnel Psychol.*, 1962, 15 (2), 195-205.—Several types of assessment ratings were made of 1st-level superiors from a variety of companies. Ratings were based on various combinations of interview, test, and report data. The following conclusions were drawn: (a) the relative validity of predictor ratings based on psychometric data appeared to be higher than those based on the interview or projective tests; (b) ratings based on complete information are not, in general, of higher validity than those based solely on psychometric tests; (c) most of the predictor-criterion agreement was based more on general impressions than on specific variables.—A. S. Thompson.

7253. Huttner, L., & O'Malley, T. R. (Ludwig Huttner Ass., Minneapolis) **Let them know!** *Personnel Psychol.*, 1962, 15(2), 179-186.—Effective and ineffective salesmen were compared on a number of variables. Differences in rated performance were not related to background data, manner of selection, nor manager differences in standards. It was found, however, that ineffective salesmen rated themselves as high as did effective salesmen although they were not rated equally by their manager. It is important for supervisors to communicate their evaluations to subordinates.—A. S. Thompson.

7254. Kirchner, W. K., & Reisberg, D. J. **Differences between better and less-effective supervisors in appraisal of subordinates.** *Personnel Psychol.*, 1962, 15(3), 295-302.—Using a behavioral item rating scale, ratings were obtained on 3 levels of subordinates and 2 levels of supervision. It was

found that the better supervisors were more discriminating in their ratings of subordinates and tended more to regard independent, forward looking action by subordinates as important while the poorer supervisors paid more attention to loyalty, getting along, cooperation.—A. S. Thompson.

7255. Medland, F. F., Hammer, C. H., & Frankfeldt, E. **Selection of NCO leaders: Status report.** *USA Personnel Res. Off. OCRD tech. res. Rep.*, 1962, No. 1127. 12 p.—The NCO Leaders Task is conducting parallel research programs to develop the initial psychological predictors of leadership potential and the evaluation system for identifying competent leaders for senior NCO positions. The Army NCO academy system has been selected as the framework for research on measurement of leadership performance. An experimental battery, consisting of 6 non-cognitive measures, was field-validated on 400 examinees completing basic combat training. On the basis of preliminary analysis and research information, 1 of the experimental measures—the peer rating of acceptance as a leader—has been placed in operational use at all Army training centers. Predictive effectiveness of the experimental test battery is being evaluated in a longitudinal study against (a) measures of leadership performance in Advanced Individual Training (AIT) and (b) on-the-job performance after about 2 years of active military service. Data collection procedures and potential end-products of the research effort are described.—A. J. Drucker.

7256. Patin, J., & Nodiot, S. **Le Test Mécanique de P. Rennes.** [The P. Rennes Mechanical Test.] *Bull. Cent. Etud. Rech. Psychotech.*, 1962, 11(1), 63-97.—This test was found to be useful in selection of young male adolescents and adults for vocational and technical training. Reliability and validity, particularly in drawing and technology, were found to be satisfactory. When tried on a female sample, the test was found to be too complex, and not as discriminatory as in the case of the male sample.—V. Sanua.

7257. Peres, S. H., & Garcia, J. R. (Sandia Corp., Albuquerque, N. M.) **Validity and dimensions of descriptive adjectives used in reference letters for engineering applicants.** *Personnel Psychol.*, 1962, 15(3), 279-286.—This study was conducted in a nuclear research and development laboratory to ascertain (a) if statements used in letters of reference could discriminate between effective and ineffective engineers and (b) if these statements fell into factor patterns. From these, 170 adjectives were obtained which yielded 5 factors: Cooperation-Consideration, Mental Agility, Dependability-Reliability, Urbanity, and Vigor. Mental Agility was most discriminating and Cooperation-Consideration the least.—A. S. Thompson.

7258. Prien, E. P. (Western Reserve U.) **Assessments of high-level personnel: V. An analysis of interviewers' predictions of job performance.** *Personnel Psychol.*, 1962, 15(3), 319-334.—In a personnel appraisal program involving both sales and nonsales occupations, psychologists were able to differentiate individuals through interviews on 2 general dimensions: Personal Relations Effectiveness and Intellectual Functioning. Their predictions of potential performance were related to supervisors' ratings of actual performance only on the Intellectual Function-

ing dimension for the nonsales occupation group. The study showed that psychologists can predict the potential job performance of individuals on the basis of information and impressions obtained in an interview and that the interview has some validity for the assessment of higher-level personnel.—A. S. Thompson.

7259. Prien, E. P., & Liske, R. E. (Western Reserve U.) **Assessments of higher-level personnel: III. Rating criteria: A comparative analysis of supervisor ratings and incumbent self-ratings of job performance.** *Personnel Psychol.*, 1962, 15(2), 187-194.—1st- and 2nd-level supervisors' ratings of subordinate job performance correlate to a greater degree than either supervisors' ratings when correlated with subordinate self-ratings of job performance. 1st-level supervisors' and subordinates' perceptions of performance criteria are consistent at a general level and to some degree in terms of specific concepts. Conceptual agreement is in the specific area of the Intellectual Effectiveness Factor of the criterion complex and lack of agreement with respect to the Personal Relations Effectiveness Factor.—A. S. Thompson.

7260. Rimland, Bernard, & Steinemann, John H. **Development and standardization of Forms 3 and 4 of the NROTC Contract Student Selection Test.** *USN Bur. Naval Personnel tech. Bull.*, 1962, No. 62-11. ii, 8 p.—Forms 3 and 4 of the Contract Student Selection Test (CSST) were designed to replace Forms 1 and 2 as the scholastic aptitude measure used in the selection of students for the Naval Reserve Officer Training Corps. "Data from the operational administration of Forms 3 and 4 in the fall semester of 1961 indicate that the two forms may be used interchangeably. The new forms appear to be satisfactory in terms of their Kuder-Richardson reliabilities (.87 and .89) and in terms of their correlations (.80 and .79) with the Scholastic Aptitude Test." Discrimination among lower ability applicants will be facilitated. "Preliminary indications suggest that Forms 3 and 4 will equal or exceed the validities of Forms 1 and 2. Tables are provided to permit conversion of CSST Form 3 or 4 total scores to Navy Standard Scores, percentiles, or to equivalent [CEE] SAT Scores. The SAT conversion tables will reduce the need for testing with the CSST at those colleges where SAT Scores are already on record."—N. Earl.

7261. Rubin, Barbara, & Parker, James W. **The Self-Reported Motivational Questionnaire (SMQ): A preliminary validation study with a population of enlisted submariner volunteers.** *USN Med. Res. Lab. Rep.*, 1961, 20(2, Whole No. 348), 18 p.—The construction and keying of a Self-Reported Motivational Questionnaire (SMQ) are described. With enlisted Submarine School volunteers, the scores are related to attrition in Submarine School. These relationships are presented with several breakdowns such as rated/nonrated and high/low scores on the Basic Battery Test, and are described in detail. The discussion of the reliability and validity of the SMQ concludes that the scores are usefully reliable, and that they are usefully valid for that portion of the population whose aptitude score (Arithmetic and Mechanical) is below the median for the total population. The final academic rank order of the 1100 Submarine School graduates studied is significantly correlated

with the SMQ only for the "low" aptitude group.—*USN MRL.*

7262. Tomlinson, Helen, & Elson, Jo Ann. **Abstracts of personnel research reports: II. 1954-1957.** *USAF PRL tech. docum. Rep.*, 1962, No. 62-25. 42 p.—Abstracts are assembled of 145 technical documentary reports issued by the Air Force's Personnel Research Laboratory from January 1954 through December 1957. They cover research projects in selection, classification, and utilization of Air Force personnel. The reports are indexed by personal author, corporate author, and project number.—*USAF PRL.*

7263. Tomlinson, Helen, & Elson, Jo Ann. **Abstracts of personnel research reports: II. 1958-1961.** *USAF PRL tech. docum. Rep.*, 1962, No. 62-26. 33 p.—Abstracts are assembled of 126 technical documentary reports issued by the Air Force's Personnel Research Laboratory from January 1958 through December 1961. They cover research projects in selection, classification, and utilization of Air Force personnel. The reports are indexed by personal author, corporate author, and project number.—*USAF PRL.*

7264. Uhlmann, F. W. (Wayne State U.) **A selection test for production machine operators.** *Personnel Psychol.*, 1962, 15(3), 287-293.—An apparatus which stimulates a packaging process was administered, as a test, to 2 groups: applicants and employees. The employees scored significantly higher than the applicant group. A validity coefficient of .44 with proficiency ratings was obtained. The test has good face validity.—A. S. Thompson.

7265. Waters, L. K., & Wherry, R. J., Jr. (USN School Aviation Medicine) **A note on alternative methods of scoring a forced-choice form.** *Personnel Psychol.*, 1962, 15(3), 315-317.—"A numerical self-applicability scale was appended to each statement in a series of forced-choice pairs. The pairs were scored by 3 methods and the validity of each method determined. The more traditional method of scoring forced-choice pairs yielded a substantially greater validity coefficient."—A. S. Thompson.

7266. Wiskoff, M. F. **Selection of anti-tank missile gunners: Status report.** *USA Personnel Res. Off. OCRD tech. Res. Rep.*, 1962, No. 1128. 17 p.—The Army Personnel Research Office conducted a small scale study on 36 trainees, the results of which were used in the selection of gunner trainees for 8 classes beginning in January 1960 in the operation of SS-10 weapons systems. 3 tests—Pattern Analysis of the Army Classification Battery, Co-ordinate Movements, and Locations—were chosen as an interim selection battery. In absence of actual firing records, an administrative recommendation served as criterion for test selection. For a 2nd study using data from the 8 classes, more realistic criteria of gunner performance were developed through consideration of varying difficulty of environmental conditions at time of missile firing. Statistical analysis is currently under way to identify the most effective predictors for a final selection battery.—A. J. Drucker.

TRAINING

7267. Abrams, Alvin J. **Experimental training of sonarmen in the use of electronic equipment: I.**

Diagnostic testing of basic sonar students. *USN Bur. Naval Personnel tech. Bull.*, 1962, No. 62-1. iv, 15 p.—During the period of December 1960 through February 1961, 79 sonar students were tested in their use of electronic test equipment. The test used was constructed to identify the specific procedural errors which accounted for inaccurate measurements. "The main conclusion of this search was that while a majority of the students mastered most of the procedural steps, few demonstrated the knowledge and experience necessary to perform over-all checks without error."—*N. Earl.*

7268. Abrams, Alvin J., & Pickering, Edward J. A check list for use by a trainer-evaluator to assess sonarman proficiency on test equipment. *USN Bur. Naval Personnel tech. Bull.*, 1962, No. 62-7. iv, 19 p.—"The purpose of this pilot study was to develop a proficiency measure for the sonarman rating which could be used effectively by operating forces in an on-going routine evaluation of maintenance proficiency. Although the instrument designed is intended for only the sonarman rating, the concept upon which it is based provides for the development of similar instruments for other electronic ratings."—*N. Earl.*

7269. Abrams, Alvin J., & Pickering, Edward J. Experimental training of sonarman in the use of electronic test equipment: IV. Diagnostic test results for advanced sonar students. *USN Bur. Naval Personnel tech. Bull.*, 1962, No. 62-9. vii, 36 p.—"This is the fourth report of a series covering various phases of a research program directed toward improving the training of sonarman in the use of standard electronic test equipments." The 1st 3 reports (see 37: 7267, 7279, 7280) were concerned with the improvement of test equipment training in the basic sonarman courses. This report presents the results from diagnostic testing of fleet-experienced sonarman.—*N. Earl.*

7270. Anderson, Adolph V. Training, utilization, and proficiency of Navy electronics technicians: I. General considerations. *USN Bur. Naval Personnel tech. Bull.*, 1962, No. 62-5. v, 30 p.—A major survey of the training utilization, and proficiency of Navy electronics technicians (ETs) was conducted during the 1st ½ of 1961. A series of 7 reports on the results of this survey is planned. The principal aim of this 1st report in the series is to present a detailed background against which to evaluate and interpret the results to be presented later. Random samples of 309 ETs from the Pacific Fleet and 106 ETs from the western United States commands were interviewed and tested. 8 data collection instruments are described and illustrated in the appendices. Descriptive data presented for the 2 samples of ETs included information on age, education, classification test scores, billet and assignment types, training received, and stated training needs. Included in this report is a brief statement of the intended content of each of the reports in the series.—*N. Earl.*

7271. Blake, Robert R., Mouton, Jane Srygley, & Fruchter, Benjamin. (U. Texas) A factor analysis of training group behavior. *J. soc. Psychol.*, 1962, 58(1), 121-130.—The study reports and identifies 3 distinct dimensions of operation within a training group, as a first approach to quantitative

analysis and systematic generalization regarding the psychological dimensions of training groups. 160 male Ss composed into 20 groups of 8 each, who were participating in 5 training laboratories conducted according to a standard design, provided 11 different scale reactions describing their perceptions of group activities on completion of each of 13 training group sessions per laboratory. The 3 dimensions identified through a factor analysis were defined as cohesion, group accomplishment, and group development feedback. The results provide a quantitative basis for assessing the experiences of individuals under conditions of laboratory learning to supplement the phenomenological and theoretical formulations which have surrounded training group endeavors in the past. Implications of the findings are discussed from several different points of view.—*Author abstract.*

7272. Briggs, George E., & Naylor, James C. (Ohio State U.) The relative efficiency of several training methods as a function of transfer task complexity. *J. exp. Psychol.*, 1962, 64(5), 505-512.—4 training methods (pure-part, simplified-whole, progressive-part, and whole task) in the acquisition of a 3-dimensional tracking task were studied. 2 levels of transfer complexity were used. Training by the whole and progressive-part methods were essentially equivalent. Both these methods produced superior transfer as compared to either the pure-part or simplified-whole methods. As task complexity increased the whole and progressive-part training methods increased the absolute, but not the relative, superiority of transfer performance as compared with the other methods. Explanations for these findings are discussed.—*J. Arbit.*

7273. Cox, John A. Application of a method of evaluating training. *HumRRO res. Memo.*, 1962, Subtask Trader I. ii, 19 p.—A course in trouble shooting and repair in the Weapons Monitoring Center served as an example of a modified application of the Ward Edwards technique for dealing with "proficiency gain, worth of training, and cost estimates" in a single figure. It is offered "as a model for training personnel to follow when testing some part of a training program."—*R. Tyson.*

7274. Hesson, James M., & Thomas, Francis H. Training materials for aerial observation instruction in basic visual skills. *HumRRO tech. Rep.*, 1962, No. 80(Suppl.). vi, 93 p.—(See 37: 7285) Material based on 3 years of research is offered as a training material supplement for the unit training officer. Illustrated sections deal with visual search techniques, recognition training, geographical orientation, and target location.—*R. Tyson.*

7275. Hoskovec, J. (Charles U., Prague, Czechoslovakia.) Schultzu autogenní trénink. [Schultz's autogenic training.] *Ceskoslov. Psychol.*, 1962, 6(1), 103-109.—Description of basic data on autogenic training and its practical uses. Experiences from Czechoslovakia, USSR, and the German Democratic Republic are reviewed. (English & Russian summaries, 20 ref.)—*V. Bricháček.*

7276. Jones, Earl I., & Abrams, Alvin J. Training and proficiency of aviation structural mechanics: II. Proficiency of first enlistment aviation structural mechanics. *USN Bur. Naval Personnel tech. Bull.*, 1961, No. 61-16. v, 29 p.—(See 36: 1LE29J) "The purpose of this report is to describe

the performance, utilization, and training of first enlistment Aviation Structural Mechanics."—*N. Earl.*

7277. Kempner, T. (U. Sheffield) **Teaching methods in management education.** *Personnel Mgmt.*, 1962, 44 (Whole No. 362), 265-272.—Discussed are 6 methods within the context of 12-week courses for executives from industry and commerce. Lectures, group projects, case studies, individual projects, business games, and role playing are covered; and experiences with each technique are related.—*A. R. Howard.*

7278. Nichols, T. F., Ward, J. S., Fooks, N. I., Brown, F. L., & Rosenquist, H. S. **Performance evaluation of light weapons infantrymen (MOS 111.0), graduates of the advanced individual training course (ATP 7-17).** *HumRRO tech. Rep.*, 1962, No. 81, xii, 54 p.—Combat readiness of graduates of the 16-week training course was evaluated with respect to "13 critical . . . performances needing improvement." Changes "in emphasis in weapons instruction and in tactical training" are suggested, as well as "improved . . . integration of . . . individual skills into effective tactical actions." 8 specific remedial training steps are recommended.—*R. Tyson.*

7279. Pickering, Edward J., & Abrams, Alvin J. **Experimental training of sonarmen in the use of electronic equipment: II. Experimental training materials.** *USN Bur. Naval Personnel tech. Bull.*, 1962, No. 62-10, iv, 73 p.—"In July of 1960 the development of an experimental training program aimed at enhancing the proficiency of sonar school graduates in the use of electronic test equipment was undertaken. This report contains copies of all the training materials which were developed for use in the experimental program."—*N. Earl.*

7280. Pickering, Edward J., & Abrams, Alvin J. **Experimental training of sonarmen in the use of electronic test equipment: III. The evaluation of the experimental program.** *USN Bur. Naval Personnel tech. Bull.*, 1962, No. 62-8, v, 37 p.—"The principal conclusion from this research was that students trained under the experimental program performed significantly better than students trained under the previous program."—*N. Earl.*

7281. Schultz, D. G., & Siegel, A. I. (Applied Psychological Services, Wayne, Pa.) **The rationale and application of job suitability as a basis for the evaluation of training.** *Personnel Psychol.*, 1962, 15(3), 261-277.—This report demonstrates a technique employing "suitability for the job" as a basis for training evaluation by: (a) describing a method for quantitatively summarizing suitability and (b) illustrating the application of the method to data collected on technicians in 4 Naval jobs. By "suitability" is meant the graduates' ability to do the tasks involved in the job. For each job task, the method calls for estimates of (a) the average proficiency on the task of a group of training program graduates and (b) the task's importance. From these estimates 3 indices are computed. The specific tasks contributing to each index can be listed and logically analyzed from the standpoint of a possible increase or decrease in training emphasis.—*A. S. Thompson.*

7282. Standlee, Lloyd S., & Hooprich, Eugene A. **Annotated bibliography of adult reading**

studies. *USN Bur. Naval Personnel tech. Bull.*, 1961, No. 61-15, 126 p.—Articles appearing in newspapers, popular magazines, and professional journals have indicated that adults of average or better reading ability can make dramatic gains in reading skills as a result of reading improvement courses. Listed are 400 references, 384 of which are abstracted, published during the 10-year period, 1950-1960. Adults in reading improvement programs were generally reported to have achieved considerable increase in speed, typically 100% or more, with some gain, or at least no loss, in comprehension. Most evidence for improvement resulted from the administration of parallel test forms before and after reading instruction, but little attention is given to practice effect on the relative merits of different teaching methods and materials.—*N. Earl.*

7283. Standlee, Lloyd S., & Hooprich, Eugene A. **Review of research on reading instruction for adults.** *USN Bur. Naval Personnel tech. Bull.*, 1962, No. 62-12, iii, 24 p.—This report is based upon an annotated bibliography of adult reading improvement studies (see 37: 7282) by the above authors. Abstracts included therein that were "research studies" are represented in the present report. The research findings are grouped into 4 categories: reading skill gains, retention of reading skill gains, transfer of reading skills, and factors influencing the effectiveness of reading instruction. (117 ref.)—*N. Earl.*

7284. Steger, W. A. **Comments on a paper by Yarnold and Nehnevajsa.** *Operat. Res.*, 1962, 10 (2), 270-271.—Yarnold and Nehnevajsa (see *Operat. Res.*, 1961, 9, 535-545) assume that training devices operate by improving the temporal-accuracy performance of man-machine links. However, it should be recognized that ability to affect performance in one area is dependent on training decisions arrived at in other areas. Network evaluation techniques are suggested as appropriate for the purpose. The author feels that Yarnold and Nehnevajsa may not have taken into account such "training devices" as manned simulation systems, to which the methods they suggested do not readily apply.—*M. R. Marks.*

7285. Thomas, Francis H. **Low altitude aerial observation: An experimental course of instruction.** *HumRRO tech. Rep.*, 1962, No. 80, vii, 66 p.—Because of increasingly effective defense, future vital combat intelligence will have to be obtained at low altitudes. 5 experiments with instruction and field exercises resulted in visual research techniques producing a 40% increase in speed of recognition. Utilization of the program is advocated. An outline of the experimental training course, a criterion test, and 12 maps are presented.—*R. Tyson.*

7286. Williams, Alton C., & Briggs, George E. (Ohio State U.) **On-target versus off-target information and the acquisition of tracking skill.** *J. exp. Psychol.*, 1962, 64(5), 519-525.—3 groups were given augmented feedback in terms of auditory clicks when they were either on-target or off-target. Augmented feedback based on a simple off-target criterion was the most effective training condition. This seemed to be a result of the emphasis on off-target criterion places on occasional large tracking errors. The group trained on this condition learned to reduce such errors more quickly and efficiently than did the on-target criterion group.—*J. Arbit.*

7287. Wolff, Peter C., Van Loo, Joseph A., & Burnstein, David D. Target detection: VII. Partial point-out of targets as collective reinforcement in group target detection training. *Hum-RRO res. Memo.*, 1962, Subtask, Firepower IV, Task 11-26. 9 p.—An experiment with Army trainees without previous experience in target detection showed that "collective or group reinforcement might be detrimental unless answers are continuously furnished—that is, furnished on all training trials."—R. Tyson.

TASK & WORK ANALYSIS

7288. Binkhorst, R. A., & Carlsöö, S. (Kungliga Gymnastika Central Inst., Stockholm, Sweden) The thumb-forefinger grip and the shape of handles of certain instruments: An electromyographic study of the muscle-load. *Ergonomics*, 1962, 5(3), 467-470.—The interosseus dorsalis I becomes more active the harder an object is pressed and the smaller the area of contact.—B. T. Jensen.

7289. Daniel, J. (Slovenskej Akad. Vied, Bratislava, Czechoslovakia) Časová mikroanalýza niektorých pracovných úkonov. [Temporal microanalysis of some working acts.] *Psychol. Stud., Bratislava*, 1961, 3, 115-134.—Analysis of movement in transferring objects to a distance of about 20 cm. was made by means of contact analysis. Direction of the movement does not significantly influence the total time of the movement with the exception of the microelement of transferring. If the working S must decide between various elements of complex stimulus situation, the total time of movement is prolonged up to 100%. (Russian & English summaries)—V. Bricháček.

7290. Gurevich, K. M., & Gadzhiev, S. S. (Inst. Psychology, Acad. Pedagogical Sciences, RSFSR) Izuchenie roli lichnogo faktora v upravlenii elektroobrudovaniem elektrostantsii. [A study of the role of individual factors in the control of electric equipment of electric power stations.] *Vop. Psikhol.*, 1962, No. 3, 37-44.—The casualty control functions of a power station operator are considered in the light of some of Pavlov's ideas. In particular, a casualty situation is considered to be one in which especially strong stimuli impinge on the nervous system of the operator. If the operator has a nervous system of the weak type he may not handle this properly. Thus, following Pavlov, external inhibition or concentration of excitation at a few points will be the cause of errors of omission. The errors occurring in a training exercise are analyzed in this light.—H. Pick.

7291. Müller, E. A. (Max-Planck-Inst. Arbeitsphysiologie, Dortmund, Germany) Occupational work capacity. *Ergonomics*, 1962, 5(3), 445-452.—Many tests of work capacity measure maximum rather than "occupational" or permissible daily occupational work. The ratio between maximum and occupational work capacities varies with age. A more appropriate test is described. (17 ref.)—B. T. Jensen.

7292. Oshanin, D. A., & Venda, V. F. (Inst. Psychology, Acad. Pedagogical Sciences, RSFSR) O nekotorykh putyakh povysheniya effektivnosti operatorskogo truda v sistemakh "chelvoek i avtomat." [On some means of increase effectiveness of operator's work in systems of man and machine.]

Vop. Psikhol., 1962, No. 3, 23-36.—In complex automatic systems the majority of control functions are carried out by computing machines. Block diagrams are presented showing decreasing amount of human control as automation increases. After prolonged vigilance man's critical readiness to actively participate in control functions, e.g., in the event of a casualty, is reduced. The authors suggest casualty training involving unexpected disconnection of the computer control. An apparatus is described which provides simulated information display and response mechanism for experimentally investigating the best organization of man and machine as a link in a complex system. This apparatus provides for varying such characteristics as volume of input information, arrangement of display, color of the components, illumination and clarity of the various signal elements, etc.—H. Pick.

7293. Rushforth, Norman Burleigh. (Cornell U.) A comparison of sample correlation matrices and a multivariate analysis of job concepts of selected industrial executive groups. *Dissert. Abstr.*, 1962, 33(7), 2460.—Abstract.

7294. Seigel, A. I., & Wolf, J. J. (Applied Psychological Services) A model for digital simulation of two-operator man-machine systems. *Ergonomics*, 1962, 5(4), 557-572.—The model used requires 12 items of input data for each subtask and each operator, the initial conditions and the parameters. These are described. The model was used to simulate in-flight refueling and an air intercept. "... it appears that for predicting operator effectiveness on tasks similar to those simulated, the model may be used with some degree of confidence."—B. T. Jensen.

7295. Thomas, L. F. (Brunel Coll. Technology, Acton, England) Perceptual organization in industrial inspectors. *Ergonomics*, 1962, 5(3), 429-434.—Behavior of inspectors of several kinds of products indicates that they develop an image of a "good" object against which they compare the one at hand. Inspection requires perceptual development with the learning of relevant figure-ground relationships.—B. T. Jensen.

WORK ENVIRONMENT & PERFORMANCE

7296. Baron, P. L'ambiance du travail: Problèmes posés par les bruits industriels. [Working environment: Problems raised by industrial noises.] *Travail hum.*, 1962, 25(3-4), 217-250.—The author studies the physical and psychological characteristics of noises, in terms of methods of study and measurement, limits in relation to deafness, intelligibility of speech, audibility in terms of background noise, and effects on work.—R. W. Husband.

7297. Edholm, O. G., Adam, J. M., & Fox, R. H. (National Inst. Medical Research, Hampstead, London, England) The effects of work in cool and hot conditions on pulse rate and body temperature. *Ergonomics*, 1962, 5(4), 545-556.—16 young males in 2 groups alternated load handling and rest periods in hot or cool environments. "If an assessment of the energy expenditure of men working in the heat has to be made, it may be misleading to use either body temperature increment or pulse rate increment without knowing the state of acclimatization." It is suggested that using temperature to cor-

rect observed pulse rate may be a useful procedure.—
B. T. Jensen.

7298. Fournier, E. *L'ambiance du travail: Protection contre les vapeurs et les poussières.* [Working environment: Protection against fumes and dusts.] *Travail hum.*, 1962, 25(3-4) 251-267.—Because of the inconvenience of wearing masks and the narrow tolerance limits, physiologically and psychologically, one must pay careful attention to dangers of deprivation, intoxication, poisoning, explosions, and allergies. The author cites a number of drugs and chemicals, as well as some case studies.—*R. W. Husband.*

7299. Hicks, Samuel A. *The effects of twenty-four hours confinement in mobile armored personnel carriers on selected combat relevant skills: A follow up.* *USA Ordn. Hum. Engng. Lab. tech. Memo.*, 1962, No. 7-62. v, 18 p.—This investigation is the 6th in a series designed to determine changes in general combat relevant performance as a result of sustained confinement in armored personnel carriers. The purpose of this investigation was to determine changes in performance as a result of a confinement period of 24 hours duration. 44 enlisted men were tested before and after confinement on tests designed to measure stamina, eye-arm coordination, locomotor coordination, equilibrium, and hand-arm steadiness. The 24-hour confinement period resulted in statistically significant losses in all areas excluding eye-arm coordination (grenade throwing accuracy).—*USA OHEL.*

7300. Joshi, Dina Nath. *The problem of the welfare of women workers.* *Indian J. soc. Wk.*, 1961, 22(3), 179-188.—Arguments are given for a separate welfare program for women laborers on the basis of their social, physical, and psychological differences from men. General principles for such a program and inherent problems are discussed under the headings: Creches and Day Nurseries, Health, Pre-natal and Post-natal Conditions, Maternal and Infant Mortality, Maternal Benefits, and Canteens.—*R. Schaef.*

7301. Kissen, Abbott T. (Wright-Patterson AFB, O.) *The effect of hyperthermia on peripheral dark adaptation.* *USAF AMRL tech. docum. Rep.*, 1962, No. 62-133. iii, 7 p.—Super- or hyper-sonic aircraft flight can produce hyperthermia in crew members. Dark adaptation is a physiologic response possibly influenced by such stress. Biochemical regeneration rate of rhodopsin might be altered if retinal blood or tissue temperatures are raised by this hyperthermia. Peripheral dark adaptation curves were obtained on 5 Ss at control (21.0° C.) and 65.6° C. temperatures alternately, using a modified Hecht-Schlaer adaptometer. In 24 heat experiments, Ss were exposed to 65.6° C. ambient air temperature for 55 minutes after which the heat was shut off. Chamber temperature declined but the Ss remained in a relatively constant hyperthermic condition during the subsequent 35-min. dark adaptation test. The adaptometer stimulus light circuit was closed or opened by the investigator in accordance with a predetermined program to validate responses at each intensity level. Curves obtained under hyperthermic conditions (with the exception of the initial and terminal values) differ, with statistical significance, from controls, indicating an increase in dark adaptation

rate under the imposed thermal stress conditions.—
USAF AMRL.

7302. Rohles, Frederick H., Jr., Grunzke, Marvin E., & Reynolds, Herbert H. (Holloman AFB, N. Mex.) *Chimpanzee performance during the ballistic and orbital Project Mercury flights.* *J. comp. physiol. Psychol.*, 1963, 56(1), 2-10.—2 flights with chimpanzee Ss were conducted as part of NASA Project Mercury program. Ss were trained on modified operant tasks to measure effects of flights on learned behavior and to provide performance information prior to manned flights. The 1st S performed on a 2-component schedule and was flown in a ballistic trajectory (Mercury-Redstone 2); the 2nd S performed on a 5-component schedule during a 2-orbit flight around the earth (Mercury-Atlas 5). Both Ss were recovered safely. As a result of these 2 flights it was concluded that performance was relatively unaffected during weightlessness, that eating and drinking were accomplished without difficulty, and that behavioral measures are essential in assessing effects of space flight on living organisms.—*Journal abstract.*

7303. Snellen, J. W. (Netherlands Inst. Preventive Medicine) *The heat stress in brick-kiln workers.* *Ergonomics*, 5(3), July 1962, 453-466.—Workers unloading ovens maintain thermal equilibrium over a relatively long period because they changed from hot inside climate to cooler outside climate frequently.—*B. T. Jensen.*

7304. Wyndham, C. H., Strydom, N. B., Morrison, J. F., Peter, J., Maritz, J. S., & Ward, J. S. (Transvaal & Orange Free State Chamber Mines, Johannesburg, South Africa) *The influence of a stable diet and regular work on body weight and capacity for exercise in African mine recruits.* *Ergonomics*, 1962, 5(3), 435-444.—20 mine recruits were examined at recruitment, after 1 month, and at 4 months. They showed a mean gain in weight and increase in maximum oxygen capacity. The correlation between weight and oxygen capacity increased with time. Ratio of oxygen intake to rate of work did not increase.—*B. T. Jensen.*

Motivation, Attitudes, Traits

7305. Arrowood, Arthur John. (U. Minnesota) *Some effects on productivity of justified and unjustified levels of reward under public and private conditions.* *Dissert. Abstr.*, 1962, 22(11), 4104-4105.—*Abstract.*

7306. Glucksberg, Sam, & Lince, Donald L. *The influence of military rank of experimenter on the conditioning of a verbal response.* *USA Ordn. Hum. Engng. Lab. tech. Memo.*, 1962, No. 10-62. v, 20 p.—The relative effectiveness of Es of different military ranks as sources of reinforcement was investigated in a verbal conditioning task. With all E variables other than perceived formal rank held constant, no effects of rank were obtained. Only those Ss who were aware of the contingency between their responses and the E's behavior increased their use of the reinforced response. Implications for psychological research in a military setting are discussed.—*USA OHEL.*

7307. Gruenfeld, L. W. (Wabash Coll.) *A study of the motivation of industrial supervisors.*

Personnel Psychol., 1962, 15(3), 303-314.—Using the method of paired comparison, supervisors measured the desirability of job features. These preferences were then related to traits of the supervisors themselves as measured by a self description inventory. Job characteristics most preferred were those concerning personal development, promotion, and a desire for personal responsibility. The opportunity to see concrete results of work performed was ranked 3rd by the supervisors. The least preferred job characteristics were related to conditions of work. Self-assurance, supervisory quality, intelligence, and occupational level as well as age proved to be most useful in differentiating the supervisors' preferences.—A. S. Thompson.

7308. Klieger, W. A., deJung, J. E., & Dubuisson, A. U. Peer ratings as predictors of disciplinary problems. *USA Personnel Res. Off. OCRD tech. res. Note*, 1962, No. 124. 18 p.—Peer and cadre ratings of basic trainees and other experimental cognitive and personality measures were evaluated as predictors of acceptability (defined in terms of court-martial conviction and type of discharge) in a sample of 1571 men entering the Army in 1955. 5th-week ratings proved to be more predictive of the acceptability criterion ($r = .40$) than did any of the other measures investigated. In both enlistee (RA) and inductee (US) sample, RA-US component, apart from age and educational level, was somewhat related to acceptability (partial $r = .14$) but to a significantly lower degree than without control on age and education ($r = .32$).—A. J. Drucker.

7309. Klieger, W. A., Dubuisson, A. U., & Sargent, B. B., III. Correlates of disciplinary record in a wide-range sample. *USA Personnel Res. Off. OCRD tech. Res. Note*, 1962, No. 125. 15 p.—In the development of techniques for the early identification of potentially delinquent soldiers, operational test scores and data on type of discharge and court-martial conviction were obtained on a sample of 875 enlisted men who entered the Army in 1952-53 when AFQT Category IV and V men were being accepted. For purposes of the study, the Selective Service inductees sample ($N = 769$) and the smaller voluntary enlistees sample ($N = 106$) were each divided into 2 subsamples—AFQT Category I-III and AFQT Category IV and V. AFQT IV and V categories showed significantly greater proportions of men incurring disciplinary action than did AFQT Category III and above. Years of education, the verbal test of the Army Classification Battery, and AFQT were consistently related to the disciplinary criterion in a sample in which all mental categories were represented. Preservice criminal record was also found to be related to disciplinary action.—A. J. Drucker.

7310. Otero, Oscar Oliva; Machado, Mario R., & Sarandón, Cándido. Condiciones psicosociales y psicosociales en el medio fabril de Córdoba. [Psychohygienic and psychosocial conditions in the industrial district of Cordova.] *Acta psiquiat. psicol. Argent.*, 1962, 8(1), 25-33.—Data is presented from the administration of a questionnaire to 85 workers from a variety of industrial jobs. Questions focused on the physical, psychological, and socioeconomic factors of work. The responses are analyzed statistically and the questionnaire is reproduced.—W. W. Meissner.

7311. Robinson, H. Alan, & Connors, Ralph P. Job satisfaction researches of 1961. *Personnel Guid. J.*, 1962, 41(3), 240-246.—The 20th in a series. (49-item bibliogr.).—S. Kavrukk.

7312. Singh, Paras Nath. (Ohio State U.) A comparison of two scales for measuring the morale of industrial workers in India. *Dissert. Abstr.*, 1962, 22(10), 3736.—Abstract.

7313. Tomeković, Tomislav. (U. Belgrade) Level of knowledge of requirements as a motivational factor in the work situation. *Hum. Relat.*, 1962, 15(3), 197-216.—Control and experimental groups were differentiated on the following variables: explanation of job instructions, and explanation and discussion of instructions with group decision regarding both instruction and explanation. The effect on output of the respective groups was measured. The conclusions were: (a) combined explanation of instructions, discussion and decision-making provide significant motivation; (b) increase of output was observed in experimental groups over control groups only in the last 3 days of the 6-day test period; (c) explanation of instructions alone does not act as a motivational factor, since the experimental group did not differ from the group given instructions without explanation until the 6th day. In none of the comparisons was the quality of production considered. (54 ref.).—W. W. Meissner.

7314. van Biemen, A., & Buiter, J. H. De prestatiebeloning. [The reward of achievement.] *Mens Onderneming*, 1962, 16(2), 108-124.—“The function of achievement-pay within the company” was the subject of discussion at a meeting of the ‘Landelijke Federatie van Contactgroepen van Personeelschefs en Maatschappelijke Werkers’ (Dutch Federation of Contact-Groups of Personnel Managers and Personnel Social Workers). . . . Experiences with bonus payment systems show a diminishing effect after they have been in use for some time. . . . and they very often lead to undue pressure for increased production, creating stress. . . . During 1958, 42% of Dutch industrial workers were paid under a ‘basic rate plus bonus’ system. . . . but support for this type of wage system is now waning. . . . The conclusion was that it was impossible to provide standard prescriptions for the best system of industrial payment.”—C. T. Morgan.

7315. Vroom, V. H. (U. Pennsylvania) Ego-involvement, job satisfaction, and job performance. *Personnel Psychol.*, 1962, 15(2), 159-177.—Data from industrial workers in an oil refinery and electronics manufacturing company support the following conclusions: (a) Persons ego-involved in their jobs are rated higher in job performance than those not so ego-involved. There is also a tendency for the relationship between ego-involvement and performance to be greater for persons high in autonomy, although the results are not significant. (b) Job satisfaction and satisfaction with self of persons ego-involved in their jobs is significantly more positively related to the amount of opportunity for self-expression in their jobs than is the case for persons low in ego-involvement. Similar but nonsignificant differences were also found for measures of satisfaction with health, reported feelings of tension, and frequency of absences.—A. G. Thompson.

7316. Walker, Kenneth F. (U. Western Australia.) Executives' and union leaders' perceptions of each other's attitudes to industrial relations. *Hum. Relat.*, 1962, 15(3), 183-196.—2 groups of union leaders and executives were given a 17-item, forced-choice questionnaire and also were asked to predict the percentage of group responses. Both union leaders and executives perceived more conflict of opinion than actually existed. Members of each group predicted responses in their own group accurately, but not in the opposite group. Neither group was significantly more accurate, and difficult items differed between groups. The conclusion is drawn that inaccuracy of perception arises more from ignorance than systematic distortion.—*W. W. Meissner.*

7317. Walther, Leon. (Ginebra) El trabajo parcelario: ¿Es siempre prejudicial al trabajador? [The assembly line: Does it always harm the worker?] *Rev. Psicol. gen. apl.*, 1961, 16(Whole No. 59), 507-514.—According to this essay, the author's investigations among watch-makers of work rhythms, job rotation, matching of co-workers, and other psychological adjustments indicate that productivity may be improved and nervous disorders reduced by proper attention to conditions fostering mental hygiene.—*E. B. Page.*

7318. Weybrew, Benjamin B., Molish, H. B., & Youniss, Richard P. Prediction of adjustment to the Antarctic. *USN Med. Res. Lab. Rep.*, 1961, 20 (1 Whole No. 350), 61 p.—The predictive validities of several psychometric tests as well as trait ratings by teams of psychologists and psychiatrists were examined with respect to criteria of adjustment to the Antarctic during the "wintering-over" period of 1957. 33 subjective symptoms reported monthly together with 3 other attitudinal criteria were intercorrelated and factor analyzed. The total N was 109. Using factor scores computed for each of the 5 factors extracted from this matrix as adjustment criteria, it was found that men with the following characteristics had the greatest adjustment potential for the Antarctic conditions: high intelligence test scores; low interest in organized sports; rated high with respect to "ability to communicate," low with respect to "overt hostility," high with respect to "ability to cope with aggression"; to have less than a college education; to be single and over 25 years of age; and to have come from the southern section of the United States. The methodological importance of the application of factor analytic techniques to repetitively collected subjective data is emphasized.—*USN MRL.*

MANAGEMENT & ORGANIZATION

7319. Collier, Abram T. (John Hancock Mutual) Decision at Zenith Life. *Harv. Bus. Rev.*, 1962, 40(1), 139-157.—A case history approach is used to describe the various aspects of the problem of promotion from within to the office of company president. Backgrounds of 4 candidates are charted, and excerpts from tape recordings of their answers to a series of questions are presented. Readers are invited to participate in decision-making.—*C. F. X. Youngberg.*

7320. Cummins, Joseph L. (Austin, Tex.) Management a profession? *Advanc. Mgmt.-Off.-Exec.*, 1962, 1(12), 9-13.—A discussion as to whether or

not management is really a profession, or if it even should be. "The desire for status, while a real force in society, is hardly sufficient to create a profession in a real sense."—*E. Q. Miller.*

7321. Fleishman, E. A., & Peters, D. R. (Yale U.) Interpersonal values, leadership attitudes, and managerial "success." *Personnel Psychol.*, 1962, 15(2), 127-143.—Intercorrelations were obtained among the scales on the Survey of Interpersonal Values, the Leadership Opinion Questionnaire, and effectiveness ratings of managers in a manufacturing organization. Conclusions were: (a) managers high on conformity were rated less effective by top management, (b) leadership attitude toward structure and consideration were not related to effectiveness, (c) high managerial levels exhibited less need for structuring than subordinates, (d) top management tends to identify the effectiveness of subordinate managers with that of their superior.—*A. S. Thompson.*

7322. Haire, Mason. (Ed.) (U. California, Berkeley) Organization theory in industrial practice. New York: Wiley, 1962. x, 173 p. \$5.75.—This is a collection of 10 papers by business leaders from a symposium of the Foundation for Research on Human Behavior. This symposium was the response to the stimulus of a symposium in the same area held in 1959 by a group of social scientists. Several recurrent themes and myths of organization theory receive treatment. These themes are: (a) authority commensurate with responsibility—hardly anywhere else are they equated; (b) line and staff—the Law of the Situation, the imperatives of the science of management, seem to make this line disappear; (c) centralization—where does it start and why? (d) the objectives of the company—is synergism automatically included? (e) the nature of man—some new assumptions.—*E. Q. Miller.*

7323. Jaques, Elliott. Objective measures for pay differentials. *Harv. Bus. Rev.*, 1962, 40(1), 133-138.—Industrial disputes concerning payment are differential in character, arising over the question of how much one group is getting as compared with others. When bargaining is used for settlement of disputes, the outcome rests on the relative power of the contending sides. When arbitration is used, it depends on the wisdom of the individual chosen. An objective yardstick is needed for measuring the level of work in any job on a nationwide basis. A measure called the "time span of discretion" is explained.—*C. F. X. Youngberg.*

7324. Losee, J. E., Allen, R. H., Stroud, J. W., & Ver Hulst, J. (Republic Aviation Corp., Farmingdale, N. Y.) A study of the Air Force maintenance technical data system. *USAF AMRL tech. docum. Rep.*, 1962, No. 62-85. vi, 197 p.—This report details the research on preparation, production, distribution, evaluation, and verification of Air Force maintenance technical data. It highlights the impact of management on the procurement of accurate, timely, and economical data and identifies the areas in which management was found to be deficient. It points out the specific shortcomings in the data, in its preparation, distribution, and use. Finally, the report recommends actions considered necessary to (a) improve management of the overall technical order system and (b) to enhance the quality, useful-

ness, and timeliness of the data produced.—*USAF AMRL*.

7325. Mathur, A. S., & Raman. Trade union leadership in Agra. *Agra U. J. Res.*, 1962, 10, 59-80.—A detailed study of 30 leaders is reported including their caste, age, field of work, economic condition, length of work in the trade unions, number of unions formed, duration of holding office, industrial experience, political affiliations, time devoted to trade union work, and industrial relations. "Outsiders continue to play a very important role in the trade unions." Some suggestions to improve leadership are offered.—*U. Pareek*.

7326. Miller, Vergil V. (Oregon State U.) Human behavior and budget controls. *Advanc. Mgmt.-Off. Exec.*, 1962, 1(12), 30-34.—"Management's adherence to a strict interpretation of efficiency controls may lead to a multitude of production problems stemming from human factors." The problems generally arise from feelings of frustration as a result of failing to meet too high a standard.—*E. Q. Miller*.

7327. Patchen, M. (U. Michigan) Supervisory methods and group performance norms. *Admin. Sci. Quart.*, 1962, 7(3), 275-294.—Some determinants of group performance norms in an industrial firm are examined. High performance norms are associated with encouragement of efficiency, together with attempts by the foreman to obtain rewards for subordinates. Each alone has a negative effect on performance. In contradiction to prior studies, close supervision is found to facilitate high performance norms. When supervision is close, reward for efficiency and strong group cohesiveness have the best effects. The author also discusses the conditions under which close supervision is effective and ineffective.—*V. S. Sexton*.

7328. Phelps, Ernest D. (Raytheon Co.) Help your engineers to get ahead. *Harv. Bus. Rev.*, 1962, 40(1), 125-132.—Conflicts frequently arise between the engineer and his personal goals on the one hand, and the patterns of operation within his firm on the other. Much of these may be eliminated if the firm's policies include periodic performance reviews, a sound development program, and promotion from within.—*C. F. X. Youngberg*.

7329. Sbandi, M. Aspetti del rapporto capodipendente nella cultura meridionale. [Aspects of head-subordinate relationship in southern culture.] *Riv. Psicol. soc.*, 1962, 29(2), 145-152.—The relationship between head and subordinates effected the behavior of the whole work group in southern Italy.—*L. L'Abate*.

7330. Stryker, Perrin. The character of the executive: Eleven studies in managerial qualities. New York: Harper, 1961. xii, 237 p. \$1.60 (paper).—A paperback edition of a book previously published by Harper in 1960 under the title *The Men From the Boys*.

7331. Sykes, A. J. M. (U. Glasgow, Scotland) The effect of a supervisory training course in changing supervisors' perceptions and expectations of the role of management. *Hum. Relat.*, 1962, 15(3), 227-243.—The course included group discussions on company problems, and succeeded in awakening supervisors to certain grievances and faults in the company, which they attributed to senior

management. The consultant conveyed these grievances to the managing director, who promised to remedy them. A delay of several months in putting these remedies into effect, and the correct perception of the supervisors that delay was due to resistances among the senior management, caused frustration and dissatisfaction. This resulted in a large percentage of the supervisors leaving or trying to leave their jobs in the year following the course. Problems created by the differential change and cautions for avoiding it are discussed.—*W. W. Meissner*.

7332. Youngberg, C. F. X., Hedberg, R., & Baxter B. (Prudential Insurance Co. America) Management action recommendations based on one versus two dimensions of a job satisfaction questionnaire. *Personnel Psychol.*, 1962, 15(2), 145-150.—A job satisfaction questionnaire permitting responses along 2 dimensions (satisfaction and importance), was administered to 1171 insurance salesmen. Problem areas based on the proportion of salesmen checking the category "Dissatisfied" were compared to those based on the proportion responding to both "Dissatisfied" and of "Great Importance." The top 6 problem areas isolated on the basis of 1 dimension did not necessarily correspond to the top 6 problem areas uncovered when 2 dimensions were examined. Addition of the importance dimension provided more meaningful findings on which to base recommendations for management action.—*A. S. Thompson*.

7333. Zuidema, H. L., Engel, H. K., & Bautz, T. M. Management development. *Mens Ordening*, 1962, 16(2), 99-107.—"The Nederlandse Vereniging voor Bedrijfspsychologie. (Dutch Association for Industrial Psychology) held a meeting devoted to the subject of management development. In order to provide for a sufficient supply of capable people to fill managerial jobs in the future, a long-term plan of selection and development is required. Before this can be done, however, the organization's development has to be examined carefully, since it is the basis for successful forecasting procedures. . . . The basic elements in management development are: 1st, long-term planning; 2nd, assessment of prevailing human resources; 3rd, recruitment; 4th, training and development."—*C. T. Morgan*.

ENGINEERING PSYCHOLOGY

7334. Adams, Jack A., & Creamer, Lyle R. (U. Illinois) Data processing capabilities of the human operator. *J. engng. Psychol.*, 1962, 1, 150-158.—The hypothesis tested was that the human operator has a 1-channel decision center whose function is resolving event uncertainties. "The Bisenory Discrete Matching Task was used, where discrete audio and visual stimuli were jointly presented for concurrent responses by the two hands. The visual stimulus series . . . had event uncertainty to occupy the one-channel central decision mechanism . . . and concurrent audio stimuli were either partly or completely redundant." Performance under the 2 bisenory conditions was compared with a unisensory, visual, control condition. 15 Ss were tested under each of these 3 conditions. Performance in both bisenory conditions was impaired, and it was concluded that the tested hypothesis was tenable.—*D. C. Hodge*.

7335. Bartlett, F. C. The future for ergonomics. *Ergonomics*, 5(4), 1962, 505-511.—Communication,

decision-making, effects of automation, and other problems are discussed briefly.—*B. T. Jensen.*

7336. Dobbins, D. A. **Monitor performance task: Status report.** *USA Personnel Research Off. OCRD tech. Res. Rep.*, 1962, No. 1123. 26 p.—In response to the needs of an expanding military technology, the task was initiated at the beginning of Fiscal Year 1960 to improve the dependability of human performance in jobs of critical importance. The primary objective is to improve performance in Army monitor jobs, with particular emphasis on developing and testing new work methods for use in operational man-machine systems. Work in 3 subtasks constitutes the major approach to this task: (a) a study of Army drivers performing on the American Association of State Highway Officials (AASHO) Road Test (completed), (b) experimental laboratory studies of vigilance behavior (in process), and (c) human factors studies of critical jobs in the operational setting (in process). Both the AASHO studies and a survey, conducted across service elements, of Army jobs having a vigilance component have confirmed the utility of a broad program of vigilance research and pointed up the need for a versatile laboratory simulator through which relevant features of many monitor jobs may be experimentally studied. Simulator specifications have been established, and experimental designs have been developed for pilot studies in information monitoring.—*A. J. Drucker.*

7337. Karvonen, M. J., Koskela, A., & Noro, L. (Inst. Occupational Health, Helsinki, Finland) **Preliminary report on the sitting postures of school children.** *Ergonomics*, 1962, 5(3), 471-478.—Recommendations are made regarding the design of school furniture. A study of sitting positions of 162 children in different classroom activities is reported. (18 ref.)—*B. T. Jensen.*

7338. Pope, Louis Trueman. (U. Houston) **A study of signal variables and level of alertness in visual and auditory vigilance.** *Dissert. Abstr.*, 1962, 22(7), 2480.—*Abstract.*

Displays

7339. Abma, John Spencer. (Ohio State U.) **The auditory encoding of printed characters.** *Dissert. Abstr.*, 1962, 22(11), 4089.—*Abstract.*

7340. Baker, E. Jo, & Alluisi, Earl A. (Emory U.) **Information handling aspects of visual and auditory form perceptoin.** *J. engng. Psychol.*, 1962, 1, 159-179.—4 experiments: (a) A modified paper-and-pencil figure-cancellation task, previously developed, was validated using 95 Ss. Response time increased with increasing figure complexity, and with constrained, rather than random, sampling. Performance was unaffected by either figure or detail size. (b) The effect of different amounts and "textures" of visual noise was tested using 50 Ss. "Response time increased linearly . . . from no noise through 25% noise." Performance was better with small, rather than large, noise detail. (c) Auditory-visual effects were studied using 8 musician-psychologists. "Pitch and time in the auditory domain were taken as analogs to the vertical and horizontal spatial coordinates of the visual figures. Results were consistent with those of the first study." (d) Auditory figures were presented to 6 Ss who tried to reproduce them using a xylophone. Errors increased with in-

creased figure complexity and with constrained sampling. "The results of all four experiments are interpreted as supporting an information-handling approach to the understanding of the perceptual processes in man." (27 ref.)—*D. C. Hodge.*

7341. Birnbaum, A. H. **Human factors research in image systems: Status report.** *USA Personnel Res. Off. OCRD tech. res. Note*, 1962, No. 122. 22 p.—The research effort of the Image Systems Task is closely coordinated with the development of systems designed to meet Army aerial surveillance needs in future warfare. To meet a continuing requirement for best utilization of the human component in image systems, 4 research subtasks were included in a research program initiated 1 July 1960. These subtasks were concerned with identification of basic human factors in development of the Tactical Image Interpreter Facility (TIIF), extraction of information from images of near real-time systems, techniques for interpreting TV imagery, and improved procedures in communication of intelligence information. The present report describes research accomplished during Fiscal Year 1962 and indicates the kind of payoff in intelligence output that can result from human factors research in image systems. Data has been collected for a study on relative effectiveness of transparencies and positive prints. Measures of interpreter performance, based upon a detailed review of selected World War II photography, have been delineated.—*A. J. Drucker.*

7342. Coules, John; Ganem, George, & Sumby, William H. **On the selection of code-names for communication systems.** *USAF ESD tech. docum. Rep.*, 1962, No. 62-306. iv, 30 p.—Intelligibility of an untested set of code-names (18 bird-names) for an Air Traffic Control Central (VOLSCAN) was studied under signal/noise conditions. The set was rejected because phonetically similar words were confused and large individual differences between listeners' accuracy scores occurred. Such large listener variability would not provide for an efficient communication system, particularly when it may be jammed. 2 new sets were constructed for a large set, labelled Set 2, of 84 words. Set 3 was selected on the basis of 2 psycholinguistic factors, high intelligibility scores, and variation in syllabic length. Although Set 4 showed high intelligibility, it was rejected because large individual differences between Ss occurred. However, for these same Ss, when they listened to Set 3, their accuracy scores showed insignificant variations and also high intelligibility. The major findings are: (a) the selection of code names for a large list merely in terms of highest intelligibility is inadequate and (b) individual differences between listeners are practically eliminated when a list is based on high intelligibility and variation in syllabic length.—*USAF ESD.*

7343. De La Mare, G., & Walker, J. (University Coll., London, England) **The visibility of direction indicators.** *Ergonomics*, 1962, 5(4), 573-579.—3 experiments utilized students and staff with better than normal vision. 9 types of signal arrows were used at each of 3 distances; arrows in each experiment were variations of those in the first. ". . . a simple shafted arrow on an open board was more legible than other kinds of indicators." Other conclusions are also presented.—*B. T. Jensen.*

7354. Smith, Sidney L. (MITRE Corp., Bedford, Mass.) Color coding and visual search. *J. exp. Psychol.*, 1962, 64(5), 434-440.—"Twelve Ss each viewed a series of 300 displays, which varied in display density, in number of colors used, in the particular color of the target, with either a white or black background, under conditions where S either knew the color of the target in advance, or did not. Neither the particular color of the target nor the display background had any significant effect on search time. Search time increased regularly with increasing display density. For multicolored displays, when the color of the target was known in advance, search times were considerably shorter than when the target color was unknown. When the color of the target was unknown, search times were not significantly different than those for single-colored displays."—*J. Arbit*.

7355. Sumbly, William H. A comparative evaluation of vibrotactile warning signal potential. *USAF ESD tech. docum. Rep.*, 1961, No. 61-24. 17 p.—The discriminative reaction times to auditory, visual, and vibrotactile stimuli are compared. Reaction times to vibrotactile signals are at least as short as the reaction times for the other modalities, although more incorrect responses were made using that sense. Of greatest interest, however, the probability of a response being made to a vibratory signal appears to be the highest of the 3. The implications of these findings are discussed.—*USAF ESD*.

7356. Wiener, Earl Louis. (Ohio State U.) Knowledge of results and the monitoring problem. *Dissert. Abstr.*, 1962, 22(11), 4102-4103.—

7357. Wolff, Peter C., & Van Loo, Joseph. Target detection: III. The relative usefulness of active participation and verbal description techniques in target detection training. *HumRRO res. Memo*, 1962, Subtask Firepower IV, Task 11-26. ii, 18 p.—Active participation during training, verbal descriptions of targets, and transfer from training in stationary to moving targets was investigated. Active participation improved target detection and increased false detections. Extensive research is recommended to verify other findings and enlarge upon them.—*R. Tyson*.

Controls

7358. Baker, D. Frederick. (Wright-Patterson AFB, O.) Survey of remote handling in space. *USAF AMRL tech. docum. Rep.*, 1962, No. 62-100. iii, 42 p.—A survey of industrial opinion on remote handling in space was undertaken to document early concepts and to identify areas of agreement, areas of conflict, and unique ideas relating to the subject. 7

industrial concerns and 1 military agency provided papers on the role of remote handling in space. These papers are discussed in terms of: (a) remote operations of which there are 5 major categories—maintenance, assembly, experimentation, transfer operations, and emergency operations; (b) space vehicle design—the manned lightweight capsule, with anthropomorphic gloves, stabilization arms, window ports, and 2 to 3 manipulator arms, being representative; (c) manipulator design—concerning actuation, configuration, control, and feedback systems; and (d) space environment factors—vision, weightlessness, temperature fluctuations, high-energy radiation, and micrometeorite collisions.—*USAF AMRL.*

7359. Hammerton, M. (Applied Psychology Research Unit, Cambridge, England) **An investigation into the optimal gain of a velocity control system.** *Ergonomics*, 1962, 5(4), 539-543.—2 groups of 5 naval ratings used a thumb joy-stick control of target acquisition with the control having 5 degrees of gain at each of 5 velocities. The 1st series of tests were not considered in the analysis since considerable learning occurred. "... the typical U-shaped curve of the relation between control sensitivity (or 'gain') and time taken to secure stable acquisition of target is not found in the circumstances of these experiments."—*B. T. Jensen.*

SIGNS & LEGIBILITY

DRIVING, ACCIDENTS, SAFETY

7360. Brody, Leon. **Accidents and "attitudes."** In Flanders Dunbar & Leon Brody, *Basic aspects and applications of the psychology of safety* (see 37: 7364). Pp. 6-24.—Attitudes, in terms of their origin, modification, or enhancement, are discussed and conclusions drawn in relation to safe behavior, especially as it applies to the operation of motor vehicles. (57 ref.)—*C. T. Gaza.*

7361. Brody, Leon. (New York U.) **Human factors research in occupational accident prevention.** New York: New York University Center Safety Education, 1962. 44 p.—Men and work, workers and their physical environment, workers and their social-psychological environment, accident investigation, and safety programing are discussed. Research questions are raised, and a selected list of previous studies and reports is provided. General conclusions are drawn. Appendices provide abstract sources, selected basic literature titles, universities engaged in relevant research, list of training programs in operation, and sources for financial support of research.—*C. T. Gaza.*

7362. Crawford, A. (Road Research Lab., Harmondsworth, Middlesex, England) **Driver judgment and error during the amber period at traffic lights.** *Ergonomics*, 1962, 5(4), 513-532.—8 drivers in each of 3 cars, at each of 5 speeds, were tested in ability to stop for amber lights at simulated intersections. Ss' judgments of need to stop corresponded to stopping distances at peak braking performance; however, the timing of the lights led to errors in about 1/8 of the

cases. Considerable data plus an appendix are included.—*B. T. Jensen.*

7363. Dunbar, Flanders. **Accidents and life experience.** In Flanders Dunbar & Leon Brody, *Basic aspects and applications of the psychology of safety* (see 37: 7364). Pp. 1-5.—*C. T. Gaza.*

7364. Dunbar, Flanders, & Brody, Leon. **Basic aspects and applications of the psychology of safety.** New York: New York University, Center Safety Education, 1959. 24 p. \$.50.—(See 37: 7360, 7363)—*C. T. Gaza.*

7365. Germain, José. (Madrid, Spain) **La predisposición a los accidentes.** [Accident proneness.] *Rev. Psicol. gen. apl.*, 1961, 16(Whole No. 59), 539-559.—Reviewed are various techniques used in several countries to collect data from traffic accidents and to analyze individual accident tendency. Statistical methods of percentages, frequency comparisons, and temporal reliability of accident records (agreement between different time intervals for the same Ss) as usually employed, are criticized for failure to control competing hypotheses sufficiently. Author calls upon psychologists for more active role in growing "science of safety." (26 ref.)—*E. B. Page.*

Accident Prevent., 2nd Ser., No. 1) 39 p. \$.50.—Techniques of group discussion are outlined, and discussion starters specific to the classroom phase of driver instruction are provided.—*C. T. Gaza.*

ADVERTISING & CONSUMER PSYCHOLOGY

7368. Leavitt, Clark. (Leo Burnett Co., Chicago, Ill.) **Intrigue in advertising: The motivating effects of visual organization.** In Advertising Research Foundation, *Proceedings of the 7th Annual Conference.* New York: ARF, 1961. Pp. 126-136.—The danger of evaluating graphic communication solely in terms of display efficiency without attention to the motivating effects of the material was discussed. An "index of communication effectiveness" combining both factors was proposed. Results were presented showing the relation of such a measure to actual readership scores for 20 ads. Some possible stimulus correlates (intrigue) to the holding power of messages were outlined and the implications of the research on sensory deprivation for communication was pointed out.—*Author abstract.*

BRIEF SUBJECT INDEX

This index supplements, but does not duplicate, the classification of abstracts given in the Table of Contents. It is assumed that the reader will have scanned whatever categories of classification interest him and that he will use this index only for cross references or for subjects that are more specific than the general categories of the classification. When many numbers are encountered under a heading, the reader may simplify his task by matching the numbers found under the two or more headings that specify his particular interest.

Psychological Abstracts

VOLUME 37

OCTOBER 1963

NUMBER 5

GENERAL

7369. Wellek, Albert. *Die Wissenschaftsproblematik der Psychologie als einer anthropologischen Disziplin*. [Scientific problems in considering psychology as a discipline of anthropology.] *Psychol. Rdsch.*, 1963, 14(2), 75-92.—Monism of method, erroneously called the method of natural sciences in psychology, is untenable because it is sterile. The contrasts between operational and phenomenological method are exaggerated. Experimental and statistical method are not identical, nor does one depend upon the other. Statistics is no guarantee for exactness. The results will only be as exact as the raw data were in the first place. Psychology is neither natural science nor philosophy but a science "sui generis" with its own problems and its own methods.—W. J. Koppitz.

7370. Wolf, I. S., *Perspectives in psychology: XVI. Negative findings*. *Psychol. Rec.*, 1961, 11, 91-95.—This article was previously abstracted (see 36: 2AA91W), but with an incomplete title.—Editor.

7371. Woltereck, Heinz. *What science knows about life*. (Trans. by Mervyn Savill) New York: Association Press, 1963. xi, 240 p. \$6.50.

OBITUARIES

HISTORY & BIOGRAPHY

7372. Gray, P. H. (Montana State Coll.) Douglas Alexander Spalding: The first experimental behaviorist. *J. gen. Psychol.*, 1962, 67(2), 299-307.—Douglas Spalding, protégé of J. S. Mill and erstwhile guardian of Frank and Bertrand Russell, was born in London about 1840 and died in Dunkirk in 1877. Although of humble birth and largely self-educated, he was well versed in the arts and sciences and he made himself an able and often hated critic in 19th century psychology. His ingenious research on animals began the experimental study of behavior; among the research problems he initiated are imprinting, auditory and visual "releasers," anti-predator reactions, and spatial perception of animals. He was a direct influence on William Preyer, George Romanes, Lloyd Morgan, William James, Wesley Mills, and Edward Thorndike in research and theory; traces of his psychological materialism may still be found in the writings of modern psychologists.—*Author abstract*.

7373. Grinder, Robert E., & Strickland, Charles E. G. Stanley Hall and the social significance of adolescence. *Teachers Coll. Rec.*, 1963, 64(5), 390-399.—Critical review of Hall's contributions. (31 ref.)—H. K. Moore.

7374. Lersch, P. *Portrait, notice biographique et bibliographique*. [Portrait, biographical and bibliographical account.] *Rev. Psychol. appl.*, 1962, 12(3), 215-216.—E. G. White.

7375. Sander, Friedrich, & Volkelt, Hans. *Ganzheits psychologie: Grundlagen, Ergebnisse, Anwendungen*. [Total psychology: fundamentals, results, applications.] Munich, Germany: C. H. Beck, 1962. xiv, 459 p. DM 48.50.—A collection of 27 papers, 19 of them originally published before 1940, reveals the creative research in Gestalt psychology by Sander and child psychology by Volkelt at the Psychological Institute of the University of Leipzig between 1920 and 1940. Recovered from numerous sources, the present collection of papers has historical value in closing a gap between the early psychological publications and the current revival of the institute.—K. J. Hartman.

7376. Watson, Robert I. (Northwestern U.) *The great psychologists: Aristotle to Freud*. Philadelphia, Pa.: Lippincott, 1963. xiii, 572 p. \$7.50. (Text ed. \$5.50)—In the first ½ of the book, the author describes the pre-Socratic and post-Socratic Greeks, the medieval theologians, and the "later" philosophers. In the 2nd ½, he traces the lives and thoughts of the major architects of modern scientific psychology. Major advances in the field are related to the personalities of the people who innovated them. Source material from medicine, philosophy, and theology is included. There are 21 chapters. The 1st covers roughly the period from Thales to Hippocrates. The 20th chapter (the last on a specific person) covers the work of Freud and is the longest in the book by a considerable margin. Other relatively long chapters are those concerning Aristotle, Descartes, and Locke and Berkeley. The shortest covers the work of Kant and Hebart. About ½ of the chapters contain an "Overview" section. The bibliography includes 40 general references and 60 pages of chapter references. An index of names and an index of subjects are given. The book is dedicated to E. G. Boring.—R. D. Nance.

THEORY & SYSTEMS

7377. Bachrach, Arthur J. (Arizona State U.) *Psychological research: An introduction*. New York: Random House, 1962. x, 113 p. \$1.45.—5 brief essays present a nonformalist account of psychological research. Operationism and monistic physicalism are stressed. Empiricistic method, informal theorizing, and the role of "serendipity" are emphasized in support of points of view expressed by Skinner and Sidman.—M. Turner.

7378. Coan, R. W., & Zagana, S. V. (U. Arizona) *Contemporary ratings of psychological theorists*. *Psychol. Rec.*, 1962, 12, 315-322.—Merit ratings were made on 5-point scale by decades from 1880-1959, and for overall value. Lists of theorists to be rated were compiled from major texts and surveys. Freud, Wundt, and James are rated at the top and the rest of the list is dominated by behaviorists.

This "contemporary American outlook" may not last as history gives us greater perspective.—*R. J. Seidel.*

7379. Dashiell, J. F. (Florida State U.) **The unreliability of secondary sources with examples from Jung.** *Psychol. Rec.*, 1962, 12, 331-334.—Although reporting of factual details of experimentation is given strict adherence, scientists commonly take unintentional license with a man's theory. Attention is called to misinterpretations of Jung's "collective unconscious" and "introvert-extravert," which errors "became established in the learned tradition by dint of uncritical acceptance and tradition."—*R. J. Seidel.*

7380. Oken, D., & Heath, Helen. (Michael Reese Hosp., Chicago, Ill.) **The law of initial values; Some further considerations.** *Psychosom. Med.*, 1963, 25(1), 3-12.—The law states that with a deviant prestimulus level, the organism can react less in the same direction when stimulated. Change scores are the measure for testing if the law applies. Normalization of the data is unnecessary. Changes in the prestimulus behavioral state of Ss distort the results. The law applies to prolonged as well as transient physiological responses. (16 ref.)—*W. G. Shipman.*

PHILOSOPHY

7381. Battig, William F. (U. Virginia) **Parsimony in psychology.** *Psychol. Rep.*, 1962, 11(2), 555-572. (Monogr. Suppl. No. 3-V11)—"The law of parsimony" and closely related qualities of simplicity and economy have been widely accepted by psychologists as legitimate criteria for choice among alternative theories, research designs, and methods of measurement and analysis of data. Several lines of argument and evidence are presented leading to the contrary conclusion that psychological research has been significantly retarded by the largely inappropriate use of such criteria, that under conditions where they can be meaningfully applied they are also unnecessary, and that psychologists at present would therefore be well advised to ignore considerations of parsimony and simplicity entirely in their choice of research strategy."—*B. J. House.*

7382. Bertocci, P. A., & Millard, R. M. (Boston U.) **Personality and the good.** New York: David McKay, 1963. xxi, 711 p. \$7.50.—The main purpose of this introductory text in ethics is to provide an analysis of psychological and ethical thinking as a means of constructing a philosophy of the good life. In Part I the concepts of Freud, Jung, Adler, Horney, E. Fromm, Maslow, and G. Allport are examined for their contributions to the nature of the good life. Part II considers the problems of motivation, freedom, and moral obligation in the light of psychology and philosophy. Part III contains analyses of the nature of duty, values, and the good life. Part IV offers a set of ethical principles to guide moral choice. Part V discusses society, sex, love, marriage, religious experience, and their relation to ethics and personality development.—*D. T. Kenny.*

7383. Chein, I. (New York U.) **The image of man.** *J. soc. Issues*, 1962, 18(4), 1-35.—A compelling commentary on our psychological presuppositions of the nature of man, pointing out the inconsistency between man as conceptualized and man as experienced, in particular with respect to man as a

free agent in contradistinction to our espousal of determinism as a scientific principle.—*A. Barclay.*

7384. Ellson, D. G. (Indiana U.) **The scientists' criterion of true observation.** *Phil. Sci.*, 1963, 30(1), 41-52.—"A theory of true observation is developed as a generalization of the method of inter-observer agreement that scientists use to determine the objectivity and reliability of observations. A true observation is defined as a statement included in a set of statements in which there is statistical dependence and perfect agreement between statements made by a universe of experimentally independent persons. . . . In this theory truth is inferred from a spatio-temporal pattern of statements as behavior rather than from the traditional correspondence between observation and object or logical relationships among statements."—*M. Turner.*

7385. Murray, H. A. (Harvard U.) **The personality and career of Satan.** *J. soc. Issues*, 1962, 18(4), 36-54.—A presentation of some conceptualizations of the nature of manifestations of evil in man with special emphasis upon discussion of the "Satanic complex."—*A. Barclay.*

7386. Ritey, Hector J. (Metropolitan Cent. Mental Health) **The human kingdom: A study of the nature and destiny of man in the light of today's knowledge.** New York: University 1962. 498 p. \$10.00.—Psychiatry is in danger of becoming a tinkering technique unless it can find some way of incorporating into its perspective the spiritual values embodied in the religious tradition. Man's destiny transcends the science-religion controversy. Physiologically, man's evolution into greater ethical and spiritual developments has its promise in the now "silent areas" of the brain; culturally, man's destiny lies in a deeper use of the family unit. The time is ripe for the insights of psychiatry and religion to merge for a greater humanity.—*O. Strunk, Jr.*

7387. Waelder, Robert. (Jefferson Medical Coll.) **Psychic determinism and the possibility of predictions.** *Psychoanal. Quart.*, 1963, 32(1), 15-42.—The philosophical problems inherent in determinism as opposed to free will are discussed. "It appears to be equally impossible to develop a consistent world picture based on complete determinism or one based on complete indeterminism; both assumptions lead to untenable, or at least unimaginable consequences." There are only limited possibilities for accurate predictions and so "there seems to be no point in proclaiming a doctrine of complete, universal determinism."—*J. Z. Elias.*

STATISTICS

7388. Cattell, Raymond B. **The relational simplex theory of equal interval and absolute scaling.** *Acta psychol., Amsterdam*, 1962, 20(2), 139-158.—The conjunctive measuring scales of physical sciences are not applicable to the behavioral sciences. "A relativistic solution is proposed based on a postulated model for science in which the relations of the whole population of variables are to have maximum simplicity." The linear simplex and the general simplex are described. The search for the remaining desideratum—an absolute zero—leads to the concept of contingent zeros. Contingent zeros stand in a hierarchy with respect to their projections on the "Master

zero" variable in the inter-correlating set of the lowest zero (in terms of mutual regression).—G. Rubin-Rabson.

7389. Ghiselli, Edwin E. (U. California) **Moderating effects and differential reliability and validity.** *J. appl. Psychol.*, 1963, 47(2), 81-86.—Classic psychometric theory holds that errors of measurement and of prediction are of the same magnitude for all individuals. Interactive effects are not recognized, and the psychological structure of all individuals is taken to be the same. To increase reliability and validity of measurement, then, attention is entirely focused on improvement of measuring devices. However, a substantial body of evidence indicates there are systematic individual differences in error, and in the importance a given trait has in determining a particular performance. Reliability and validity of measurement can be increased by the use of moderator variables which predict individual differences in error and in the importance of traits. (16 ref.)—*Journal abstract.*

7390. Cooley, William W., & Lohnes, Paul R. (Harvard U.) **Multivariate procedures for the behavioral sciences.** New York: John Wiley, 1962. x, 211 p. \$6.75.—Intended to implement a course in multivariate analysis, this book presents the mathematics and behavioral science illustrations of these multivariate techniques: (a) multiple and canonical correlation, (b) multivariate analysis of variance and covariance, (c) multiple-discriminant analysis, (d) classification procedures, and (e) factor analysis. Provided for each procedure are "flow charts for programming any digital computer . . . [and] FORTRAN-coded, tested, and proven computer programs," where FORTRAN is the IBM coding language acceptable to IBM 704, 709, and 7090 computers. Utility subroutines for matrix inversion are shown in the last chapter, as well as methods for extracting latent roots and vectors used in the computer programs contained in the book.—R. Perloff.

7391. Faverge, J. M., Flament, C., de Groot, A., Knops, L., Reuchlin, M., & Yela, M. **Les problèmes de la mesure en psychologie: Symposium de l'association de psychologie scientifique de langue française.** [The problems of measurement in psychology: Symposium of the Association of Scientific Psychology of the French Language.] Paris, France: Presses Universitaires France, 1962. 184 p. NF 1200.—A report of the March 1961 meeting at the University of Amsterdam and discussions about the stages of measurement, the significance of measurement in psychology, psychophysical measurement, psychometric problems, the psychological scope of factor analysis, and measurement in social psychology.—C. J. Adkins.

7392. Moon, John W. (U. Alberta, Canada) **A note on "Pattern Variants on a Square Field."** *Psychometrika*, 1963, 28(1), 93-95.—It is shown how results of Prokhovnik on the number of pattern variants that may be formed by k markers on a square network of m^2 positions may be derived more simply by means of a combinational theorem of Pólya's, which may also be used to solve systematically many other problems of this type.—*Journal abstract.*

7393. Reuchlin, Maurice. (École Pratique Hautes Études, Paris, France) **Les méthodes quantitatives**

en psychologie. [Quantitative methods in psychology.] Paris, France: Presses Universitaires France, 1962. viii, 454 p. NF 20.—Demonstrating first that quantitative problems in psychology do not differ in nature from those posed by modern physical science, the measurement of sensations and mental capacities by methods appropriate to each is then reviewed. An attempt is made to specify what is being measured and to determine the proper psychological dimensions on which these measurements must be based. A 2nd section deals more directly with methodological technique, discussing concepts such as personality type, mental age, threshold, sampling, correlation, factor analysis, and analysis of variance. There is a concerted effort throughout to integrate experimentation based on the study of single isolated variables with the statistical analysis of more complex ensembles of variables and even with the analysis of much less tidy clinical observations. (420 ref.)—G. H. Mowbray.

7394. Thompson, John W. (University Coll., London, England) **Bi-polar and unidirectional scales.** *Brit. J. Psychol.*, 1963, 54(1), 15-24.—By comparison with physics, the dynamic aspects of psychological measurement have not received sufficient attention. In psychology there is a need for categories that are fundamentally bi-polar as well as for single unidirectional categories. The consequences are discussed: (a) for the overall classification of scales, and (b) for the application of Guttman scaling techniques. (30 ref.)—*Journal abstract.*

7395. Ward, Lorne H. (U. Colorado) **Two interpretations of highly correlated measures.** *Psychol. Rep.*, 1962, 11(2), 407-409.—"Simply because behavioral variables are highly correlated does not necessarily mean that they are 'measures' of a single psychological variable as has often been assumed in psychological measurement. There may be more than one variable involved." Ways are explored "in which it might be determined whether highly correlated measures were 'getting at' the same or different variables."—B. J. House.

7396. Zimmer, Charles E. **Chance distribution of inconsistent response patterns in paired comparison and multiple ranking designs.** *USAF PRL tech. docum. Rep.*, 1963, No. 63-1. iii, 5 p.—Comparative judgments are used in developing scales for various personnel and occupational criteria. In scaling data from paired comparisons, frequency of inconsistent responses is crucial. To determine whether information from the simpler and more economical multiple ranking design can be evaluated by the same techniques as for a complete paired comparison design, computer programs were adapted whereby the full population of possible response patterns could be randomly sampled to determine the chance distribution of inconsistent responses for both designs. Results for the 1000 randomly selected patterns showed that the multiple rank order design restricts the possible number of response patterns and reduces the frequency of inconsistent patterns. The distributions were so different that techniques devised for testing significance of extreme frequencies for data from the classic paired comparison design are inappropriate for evaluating extreme occurrences in multiple ranking data. Since the multiple ranking distribution approximates the normal distribution, it would be suitable to evaluate empirical data by comparison with

the parameters here determined for the random sample of the full population of response patterns.—*USAF PRL.*

Experimental Design

7397. Binder, Arnold. (Indiana U.) Further considerations on testing the null hypothesis and the strategy and tactics of investigating theoretical models. *Psychol. Rev.*, 1963, 70(1), 101-109.—David A. Grant has argued that it is inappropriate to design experiments such that support for a theory comes from acceptance of the null hypothesis. The present article points out that while this position could be defended in Fisher's approach to testing statistical hypotheses, it could not in the Neyman-Pearson approach or on more general scientific grounds. It is emphasized that one optimally designs experiments with enough sensitivity for rejecting poor theories and accepting useful theories, whether acceptance or rejection of the null hypothesis leads to empirical support. The argument that, in the procedure to which Grant objects, an insensitive experiment is more likely to lead to support for a theory is shown to be only a special case of the argument against bad experimentation. (37 ref.)—*Journal abstract.*

7398. Crowell, Fred A., Schultz, Charles B., & Kogan, William S. (U. Washington) Development of a multiple schedule baseline technique. *Psychol. Rep.*, 1962, 11(2), 335-340.—4 steps in developing a base-line are described: "(1) acquisition of discrimination, (2) generalization, (3) nonreinforced intervals, and (4) tachistoscopic presentation of stimuli. Sample data were presented illustrating the various phases of the baseline that were obtained from adult male psychiatric patients from a VA General Medical Hospital. It was suggested that the multiple schedule procedure has a number of research applications. Several of these applications in the areas of personality assessment and discrimination learning were described."—*B. J. House.*

7399. Stricker, G. (U. Rochester) An approach to assessing the meaning of "no change" in a pre-post experimental design. *J. gen. Psychol.*, 1962, 67(2), 237-240.—A method for analyzing data from "before and after" experimental designs in which Ss are used as their own control—the direction of change is the significant datum and the incidence of no change is high—was described and related to the Adjective Check List. The method involved the successive applications of a 1-tailed binomial test and a 2-tailed sign test. The former is used to assess the significance of the proportion of the sample affected by the experimental condition and the latter to assess the significance of directionality of change.—*G. Stricker.*

Formulas & Calculations

7400. Block, Jack. (U. California, Berkeley) The equivalence of measures and the correction for attenuation. *Psychol. Bull.*, 1963, 60(2), 152-156.—In literature reviews and critiques, measures are often evaluated in regard to their conceptual equivalence. In making this evaluation, the empirical correlation between the 2 measures being compared should be corrected for attenuation at least approximately. Unless this correction is applied, alternative measures

may be presumed to be importantly different when, giving due weight to the unreliabilities present, it may be seen that the identical underlying dimension is being reflected. In psychology, where enough discrepancies already characterize our findings, this interpretive error should not deny us the occasional equivalences that come along.—*Journal abstract.*

7401. Feldt, Leonord S. (State U. Iowa) Note on use of extreme criterion groups in item discrimination analysis. *Psychometrika*, 1963, 28(1), 97-104.—The purpose of this note is to reconsider the Kelley-Cureton definition of optimal extreme groups for estimating item-criterion correlations. Optimal tail per cents are derived, using the criterion of minimum sampling variance of the tetrachoric correlation coefficient, and the findings are related to earlier work of Mosteller. It is shown that upper and lower 27% groups yield the most precise estimate of the tetrachoric coefficient only when the population correlation is close to zero. When the population value is .4, extreme 20% groups provide estimates with the smallest sampling error variance. It is further shown, however, that 27% extremes yield highly efficient estimates. Thus no change is recommended in traditional item analysis procedures.—*Journal abstract.*

7402. Gocka, Edward F. (VA Hosp., American Lake, Wash.) An algebraic computation of weights for Thurstone's analytic method. *Psychol. Rep.*, 1962, 11(2), 507-514.—A short algebraic computational procedure for calculating weights is described. Computed weights are compared with Thurstone's weights and their use is illustrated in examples for 2 different rotational methods.—*B. J. House.*

7403. Hazewinkel, Aart. (Netherlands Inst. Preventive Medicine, Leiden) A note concerning the Creager-Valentine paper. *Psychometrika*, 1963, 28(1), 105-108.—The U_1 statistic discussed by Creager and Valentine in a recent paper is defined as a standard error of estimate for the regression of a composite, consisting of n components, on the $n-1$ components, exclusive of the j th component. It is shown that this standard error equals the standard error of estimate for the prediction of the j th component from the other $n-1$ components. This equality is used to suggest an efficient procedure to compute all primary uniquenesses U_1 .—*Journal abstract.*

7404. Huygelier, N. X^2 als discriminatie-index in de item-analyse. [X² as an index of discrimination in item-analysis.] *Tijdschr. Stud.-Beroepsorient.*, 1962, 9, 32-39.—An adaptation is described of the chi square test by dividing the sample in 2 groups: strong and weak (1 degree of freedom). Also presented is a formula for the differences between comparable elements of both groups in order to find whether the chi square is significant.—*R. Piret.*

7405. Lienert, G. A. (Hamburg U., Germany) Die zufallskritische Beurteilung psychologischer Variablen mittels verteilungsfreier Schnelltests. [Statistical evaluation of psychological variables by distribution-free rapid tests.] *Psychol. Beitr.*, 1962, 7(2), 183-217.—A comprehensive review of different types of distribution-free statistical tests, characterized by economy (short or rapid tests). The review is followed by research examples and applications of these tests. Some distribution-bound short tests and

some quick methods of estimating parameters are mentioned. (40 ref., English & French summaries)—*H. J. Priester.*

7406. Lord, Frederic M. (Educational Testing Service) **Biserial estimates of correlation.** *Psychometrika*, 1963, 28(1), 81-85.—Broghden's coefficient of selective efficiency and Clemans' χ are more efficient than biserial r when the correlation is high. Some empirical sampling studies are reported comparing the standard errors of these statistics.—*Journal abstract.*

7407. McLean, James F., & Dufort, Robert H. (Wake Forest Coll.) **Note on the computation of rate of response directly from a cumulative record.** *Psychol. Rep.*, 1962, 11(2), 332.—Description of a convenient calculational method.—*B. J. House.*

7408. Melton, Richard S. (Psychological Corp.) **Some remarks on failure to meet assumptions in discriminant analyses.** *Psychometrika*, 1963, 28(1), 49-53.—The linear discriminant function and the generalized distance function, 2 special cases of discriminant technique, require multivariate normality and homogeneous variance-covariance matrices, and hence utilize only mean differences among groups. The more general methods can also utilize differences in variances and/or covariances. Tables are given showing the discriminatory value of differences in means, variances, and intercorrelations, taken singly. Equations which utilize all such differences are given for the normal multivariate distribution.—*Journal abstract.*

7409. Moses, Lincoln E., & Oakford, Robert V. **Tables of random permutations.** Stanford, Calif.: Stanford Univ. Press, 1963. 233 p. \$7.00.—For many common uses, investigators in biological and social sciences find tables of random permutations easier to use than tables of random numbers. The volume contains tables of random permutations of 9, 16, 20, 30, 50, 100, 200, 500, and 1000 integers. The RAND deck of a million random digits was the source.—*C. T. Morgan.*

7410. Tupes, E. C. (Aerospace Medical Division, AFSC) **Correcting correlation coefficients for group heterogeneity when one variable is a dichotomy.** *Psychometrika*, 1963, 28(1), 43-48.—A method is illustrated for estimating correlation coefficients and mean criterion scores in a full-range population from bivariate distributions available in a selected sample when the criterion is a dichotomy. The proposed method requires only the assumptions needed for use of formulas for correcting correlation coefficients of restriction of range when both variables are continuous and is suitable for use when restriction is due to either direct or indirect selection.—*Journal abstract.*

7411. Tupes, Ernest C. (Lackland AFB, Tex.) **Correction of correlation with a dichotomous variable for restriction in range.** *USAF PRL tech. docum. Rep.*, 1962, No. 62-24. iii, 5 p.—In evaluating tests proposed for screening recruits, it is necessary to estimate correlations for a full range of scores with some Air Force criterion of success from correlations based on the selected group. A method is presented for estimating the correlation for the full-range population from distributions of scores for the successful and unsuccessful groups of the selected

sample. The method requires only the assumptions made for the standard formulas used to correct correlation coefficients for restriction of range when both variables are continuous. It is suitable whenever the criterion is a dichotomy, whether restriction is due to direct or indirect selection.—*USAF PRL.*

Factor Analysis

7412. Anderson, T. W. (Columbia U.) **The use of factor analysis in the statistical analysis of multiple time series.** *Psychometrika*, 1963, 28(1), 1-25.—Factor analysis has been proposed and used as a method of statistical analysis of several measurements made on one individual repeatedly over a period of time. This paper discusses some difficulties in applying factor analysis to multiple time series and attempts to indicate to what extent such methods can accomplish the goals of time series analysis. Some other methods are suggested.—*Journal abstract.*

7413. Cattell, Raymond B., & Gorsuch, Richard L. (U. Illinois) **The uniqueness and significance of simple structure demonstrated by contrasting organic "natural structure" and "random structure" data.** *Psychometrika*, 1963, 28(1), 55-67.—The study compares the extent to which naturally structured data and artificial, relatively random data (both with the same basic parameters) produce simple structure factors which are uniquely determined. 2 examples of unstructured matrices were compared with the ball problem matrix. The results show that an oblique position of maximum hyperplane count in the structured data differs from that in the unstructured by reaching a significantly more unique position in terms of the exactitude with which it is rediscoverable when starting from different positions, and by reaching (at the maximum) a significantly higher hyperplane count (28 ref.).—*Journal abstract.*

7414. Gibson, W. A. (Dept. Army) **Factoring the circumplex.** *Psychometrika*, 1963, 28(1), 87-92.—This paper presents a way of factoring the Guttman circumplex to get factor weights whose pattern is close to that postulated by Guttman for the circumplex. An empirical example, including a crude procedure for diagonal estimation, is shown. Other sources of nonuniqueness are discussed, and the limitation to odd-numbered complexity for the tests is indicated. An orthodox factor analysis is applied to the example, and this provides a basis for comparison of the 2 opposing models.—*Journal abstract.*

7415. Guilford, J. P., & Zimmerman, Wayne S. (U. Southern California) **Some variable-sampling problems in the rotation of axes in factor analysis.** *Psychol. Bull.*, 1963, 60(3), 289-301.—In basic research with factor analysis, irregularities of sampling experimental variables make computer rotations and oblique solutions of dubious value. Both are functions of the selection of variables. Criteria of simple structure are sufficiently loose to permit different rotational solutions to satisfy them. Illustrative examples are given, comparing solutions with quartimax, varimax, and orthogonal graphic rotations. Only the latter gave satisfactory psychological meaningfulness.—*Journal abstract.*

7416. Weitzman, R. A. (Bar-Ilan U., Israel) **A factor analytic method for investigating differences between groups of individual learning**

curves. *Psychometrika*, 1963, 28(1), 69-80.—In this curves are described quantitatively by single numbers which are used in a statistical test to determine whether 2 or more groups of learning curves are significantly different. The method has some logical advantages over prevailing methods in that it avoids the use of averaging learning curves and of arbitrary measures of slope and asymptote. Its disadvantage is computational. Since it involves the use of factor analytic procedures, it may be tedious to apply unless computation is carried out on a high-speed computer. (17 ref.)—*Journal abstract*.

GENERAL BOOKS & REFERENCE WORKS

7417. Havemann, Ernest. *The age of psychology*. New York: Grove Press, 1962. ix, 115 p. \$.50.—A paperback reprint of a book originally published in 1957, which in turn was a reprint, with revisions, of a series of articles appearing in *Life Magazine* in 1957.

7418. Miller, George A. (Harvard U.) *Psychology: The science of mental life*. New York: Harper & Row, 1962. xi, 388 p. \$.65.—“In this book I have tried to explain what the science of psychology is like and how it got that way.” Emphasis is on key topics, presented in historical order. The more technological and applied aspects are omitted. Interwoven with discussions of traditional experimental areas are biographies of Wundt, William James, Galton, Pavlov, Freud, and Binet. A glossary and suggestions for further reading are appended.—*H. P. David*.

ORGANIZATIONS

PROFESSIONAL PROBLEMS

7419. Kantor, J. R. (Chicago, Ill.) *Perspectives in psychology: XXI. Psychology: Scientific status-seeker*. *Psychol. Rec.*, 1962, 12, 351-357.—Scientific status-seeking is praiseworthy and an essential ingredient in the progress of science since “scientists must constantly improve their status by expanding their goals and operations.” Psychology has achieved such status by abjuring mind, sensation, and other invalid or metaphysical constructs and by proper organism orientation. Author proposes “it is unnecessary to go beyond the postulate that psychological events are exclusively the interbehaviors of organisms and stimuli objects.” Psychology, having attained status, can now help other sciences based on the common assumptions of analysis of “event-fields and the nature of the observer-observed relation.”—*R. J. Seidel*.

7420. Lucier, Omer, & Lebo, Dell. (U. Pennsylvania) *Writing for machine retrieval*. *J. gen. Psychol.*, 1962, 67(2), 199-203.—Machine information retrieval, or an electro-mechanical system of searching for information in scientific publications, is inevitable. The necessity of the writer's cooperation in preparing articles for easy and accurate information retrieval, by the identification of key issues, is stressed.—*D. Lebo*.

Psychological Personnel

7421. Robinowitz, Ralph. (VA Hosp., Waco, Tex.) *Psychologist in nursing education*. *J. gen. Psychol.*, 1962, 67(2), 225-227.—Clinical psychol-

ogists for many years have played an important role in the teaching and clinical training of several related disciplines, including the field of nursing. A program has been developed at Veterans Administration Hospital, Waco, Texas, utilizing a psychology consultant on training and training methods, especially with nurses and psychiatric aides. The psychologist contributes to the insights, understanding, and skills of the staff nurse working with patients in groups. The nurse can thus build relationships which are necessary to patient betterment and effective functioning of the nurse. The psychiatric aide assigned to a continuous group throughout the day gains a greater awareness of the effect one has on another's behavior. New aides receive in-service training of group procedures. Student nurses observe how behavior may change and learn the overall meaning of a group situation.—*R. Robinowitz*.

Training in Psychology

7422. Hau, Theodor F. *Klinische Psychologie unter tiefenpsychologischem Aspekt*. [Clinical psychology under the aspect of depth-psychology.] *Psychol. Rdsch.*, 1963, 14(2), 115-124.—Many problems in clinical psychology can only be treated successfully if the psychologist is aware of unconscious motivation and inhibited drives. Since intellectual discussion is not sufficient for gaining experience in such matters, a supplementary analytic-therapeutic education is advocated for clinical psychologists.—*W. J. Koppitz*.

PSYCHOLOGY ABROAD

7423. Adams, James F. (Temple U.) *The status of psychology in the universities of Austria and Germany: 1960-1961*. *J. gen. Psychol.*, 1962, 67(2), 337-347.—Research interests, biographical data concerning the director of the psychology institute, size of student enrollments, and a survey of physical facilities are given for the following universities in Austria and Germany. Austria: Karl-Franzens, Graz; Leopold-Franzens, Innsbruck; University of Vienna. Germany: Free University of Berlin, West Berlin; Humboldt, East Berlin; Rheinische Friedrich-Wilhelm, Bonn; University of Cologne; Friedrich-Alexander, Erlangen; Johann Wolfgang Goethe, Frankfurt; Albert-Ludwig, Freiburg in Breisgau; Georg-August, Göttingen; University of Hamburg; Ruprecht-Karl, Heidelberg; Karl-Marx, Leipzig; Johannes Gutenberg, Mainz; Phillips, Marburg; Ludwig-Maximilians, Munich; Westfälische Wilhelms, Münster; University of Saarbrücken, Saar; Eberhard-Karls, Tübingen; Julius-Maximilians, Würzburg.—*Author abstract*.

7424. Hopkins, J. (National Inst. Industrial Psychology, London, England) *Bibliographie des recherches psychologique conduites en Afrique*. [Bibliography of psychological research conducted in Africa.] *Rev. Psychol. appl.*, 1962, 12(3), 201-213.—“A 253-item bibliography, chronologically arranged, and grouped under 6 headings: I. General (30 items) II. Sensori-motor aptitudes (16 items) III. Intellectual aptitudes (63 items) IV. Psychology of work (28 items) V. Social psychology and personality (77 items) and VI. Psychiatry (39 items).”—*E. G. White*.

7425. **Státní Lékařská Knihovna.** [National Medical Library] (Prague, Czechoslovakia) **The annual of Czechoslovak medical literature: 1959.** Prague, Czechoslovakia: Státní Zdravotnické Nakladatelství [State Health Publishing House], 1961. xvi, 732 p.—The annual has 4 sections. Part III, the major division, lists journals alphabetically; and under each journal the authors and titles of articles from each issue of the year are listed. The titles are first given in the original language and then in English translation. In Part II, almanacs are listed in the same manner. In Part I, "Books," and in Part IV, "Works of Czechoslovak Authors Published Abroad," the materials are classified under subject headings.—*E. Y. Borrowman.*

7426. **Walther, Léon.** **La technopsychologie, ses origines et sa portée sociale dans le cadre de la civilisation occidentale.** [Applied psychology, its origins and its social import within the framework of western civilization.] *Rev. Psychol. appl.*, 1962, 12(3), 141-161.—"A brief history of systems of values contrasts those of the East (China, India) with those of the West. . . . 'Technopsychologie' coined by Liepmann, Clarapède, and Walther, is defined as the application of psychology to the method of work with the aim of adapting work to the needs of man. . . . The importance of rhythm is stressed in making work meaningful. Automation is discussed as a possible means of deepening culture, if leisure is used for spiritual purposes and workers paid as consumers. A fundamental transformation of economics and of values is envisioned which may bring about a synthesis of Eastern (Indian) and Western philosophies." (29 ref.)—*E. G. White.*

EXPERIMENTAL PSYCHOLOGY

7427. **Berry, R. N.** (Indiana U.) **Task difficulty, performance, and skin conductance levels.** *Percept. mot. Skills*, 1962, 15(2), 474.—The data analysis showed that changes in task difficulty had no significant effect on skin conductance levels (SCLs). Each S fluctuated throughout the entire session within his own narrow range of conductances. Further, it was evident that, for a given S, changes in task difficulty did not substantially change his rank order of performance within the group. Since changing the level of problem difficulty changed neither the level of motivation, as defined by the SCL, nor rank order of performance, it may be hypothesized that such changes in rank order of performance, if they are observed, may be attributed to changes in level of motivation.—*W. H. Guertin.*

7428. **Greenspoon, Joel.** (Florida State U.) **The effects on transfer of time delay and task similarity: A literature review.** *USAF AMRL tech. docum. Rep.*, 1963, No. 63-22. iv, 21 p.—A review of selected literature pertinent to the effects of similarity and delay on transfer is reported. Emphasis is given to the more recent research and that which seems to make a greater contribution to knowledge of these effects—especially studies in which similarity and time delay were manipulated jointly. Although considerable research has been accomplished, the effects of similarity and time delay (either singly or jointly) are not known with sufficient precision to enable satisfactory use outside of the narrowly con-

strained laboratory contexts, if even there. Effective prediction on the basis of similarity will depend on the development of a rigorous and reliable technique for its measurement. The effects of delay can only be adequately determined after this is accomplished. (59 ref.)—*USAF AMRL.*

7429. **Hammes, J. A.** (U. Georgia) **Suggestibility and humor evaluation.** *Percept. mot. Skills*, 1962, 15(2), 530.—The effect of a structured suggestibility condition based on a theoretical peer evaluation was strong. A definite sex difference also emerged, in that female Ss in both low- and high-anxious groups judged the cartoons relatively more humorous than did male Ss in both anxiety groups—even those cartoons suggested to be rated low in humor. Appreciation of light humor material appears, therefore, to be a function not only of manifest anxiety and sex, but also of suggestibility, structured in this study in terms of a theoretical peer evaluation.—*W. H. Guertin.*

7430. **Moeller, G., & Chattin, C. P.** (USN Medical Research Lab.) **The Palmar Perspiration Index and pursuit tracking.** *Percept. mot. Skills*, 1962, 15(2), 463-473.—The utility of the Palmar Perspiration Index (PPI) as a measure of psychophysiological state was evaluated using a simple pursuit tracking task. 36 naval enlisted men served as Ss in the 4 conditions of the experiment which was based on a $2 \times 2 \times 20$ factorial design, with dimensions of initial control-display ratio, final ratio, and blocks of 4 tracking trials. Each S participated in 80 trials over 4 days; PPIs were taken and mean time on target computed for blocks of 4 trials. Palmar perspiration was found to decrease and tracking performance increase with experience in the experimental situation. PPI appears as useful as other more complex measures of psychophysiological state.—*W. H. Guertin.*

7431. **Thor, D. H.** (U. of Georgia) **Diurnal variability in time estimation.** *Percept. mot. Skills*, 1962, 15(2), 451-454.—6 Ss estimated 30- and 120-sec. intervals by the production method at 6 times of day. A systematic diurnal variability in estimate duration was revealed. Shape of the diurnal function reflected day or night activity patterns. Daily afternoon naps by one S were evident in her time estimate data. Diurnal blood pressure curves tended to resemble diurnal time estimate curves. The importance of the results are twofold. First, and quite obviously, they indicate the existence of a diurnality in time estimation and imply the need for appropriate control in all time estimation studies. Secondly, the results point to the influence of an underlying physiological variable.—*W. H. Guertin.*

PSYCHOPHYSICS

7432. **Atkinson, Richard C.** (Stanford U.) **A variable sensitivity theory of signal detection.** *Psychol. Rev.*, 1963, 70(1), 62-77.—A 2-process model for signal detection is proposed that is applicable to both yes-no and forced-choice experiments. One process describes systematic changes that may occur in the S's sensitivity level to external stimuli; the other process defines a learning mechanism that determines trial-to-trial changes in the S's decision role as information accrues to him. From the theory one can derive predictions for gross statistics like

receiver-operating-characteristic curves and also for detailed sequential effects such as autocorrelation functions defined over stimulus-response runs. Predictions for sequential effects are particularly important in evaluating the theory and provide a valuable insight into the character of the detection process. Application of the theory to various special cases is considered; some predictions are derived and checked against experimental data. (22 ref.)—*Journal abstract*.

7433. Bernyer, G. Étude sur la validité d'une échelle de sensation d'effort musculaire. [The validity of a scale for estimating muscular effort.] *Année psychol.*, 1962, 62(1), 1-15.—With the aid of Pierons' gravimeter, Stevens' direct estimate method was used for subjective estimation of muscular effort in weight-lifting. 8 Ss lifting 8 different weights in succession: gave highly variable replies to the same stimulus. The results differed significantly according to Ss and to light, medium, and heavy weights. Ss' subjective responses cannot be considered basic to a general law.—G. Rubin-Rabson.

7434. Davidson, Robert S. (Bryn Mawr Coll.) Relevance and category scales of judgment. *Brit. J. Psychol.*, 1962, 53(4), 373-380.—Once adaptation levels had been established in category judgements of the height and lightness of a series of grey blocks, a tall, light block was introduced, and presented with each of the series. $\frac{1}{2}$ of the Ss were instructed to reject any block which was lighter than it, and half to reject only those taller. After each decision both groups categorized height and lightness as before. Shifts in scales of judgment were associated with differences in the relevant attributes of the standard.—*Journal abstract*.

7435. Eisler, Hannes, & Ottander, Chris. (U. Stockholm, Sweden) On the problem of hysteresis in psychophysics. *J. exp. Psychol.*, 1963, 65(6), 530-536.—Subjective velocity was estimated by modified methods of magnitude estimation and category rating, presenting the stimuli in ascending and descending series separately. Hysteresis was found and the mid-points were predicted with good precision from a model describing the relation between category and magnitude scales. It was shown that the main factor producing hysteresis is a difference in the "subjective zero," ϕ_0 , of the power function $\psi = k(\phi - \phi_0)^2$, between ascending and descending series. It is tentatively suggested that the same effect may account for the time-order error.—*Journal abstract*.

7436. Ekman, Gösta. (U. Stockholm, Sweden) A direct method for multidimensional ratio scaling. *Psychometrika*, 28(1), 33-41.—A generalization of direct ratio scaling methods to multidimensional ratio scaling is described. This method requires an O to report the proportion of a standard percept that is contained in a given percept and vice versa. The method was developed to meet requirements for experimentation in such areas as color vision, gustation, and olfaction. (15 ref.)—*Journal abstract*.

7437. MacKay, D. M. (U. Keele, Staffordshire, England) Psychophysics of perceived intensity: A theoretical basis for Fechner's and Stevens' laws. *Science*, 1963, 139(Whole No. 3560), 1213-1216.—A "matching-response" model of psychophys-

ical judgment is proposed, in terms of which power-law relationships would be expected between perceived intensity and stimulus strength, even though receptors had logarithmic response characteristics. On this model, observed differences in exponent for various modalities would reflect differences in coupling coefficients, rather than in transducer mechanisms.—*Journal abstract*.

7438. Poulton, E. C., & Simmonds, D. C. V. (Applied Psychology Research Unit, Cambridge, England) Value of standard and very first variable in judgments of reflectance of grays with various ranges of available numbers. *J. exp. Psychol.*, 1963, 65(3), 297-304.—1200 unsophisticated O's each made 2 numerical estimates (NEs) of the magnitude of the reflectance of a variable gray with respect to a standard typically called 10. With standards of high reflectance, variables with reflectances still higher gave the larger exponents. The reverse was the case with standards of low reflectance. The effects increased as the range of numbers available to O was reduced. Averaging exponents from multiple and fractional estimates produced larger means when the reflectance of the standard was high. Fractional NEs were influenced by prior multiple NEs and vice versa. These results raise doubts about the generality of direct measurements of sensory magnitude. (16 ref.)—*Journal abstract*.

7439. Stewart, John L. (U. Arizona) Quantitative laws for sensory perception. *Psychol. Rev.*, 1963, 70(2), 180-192.—A model for subjective intensity derived from an elementary sensor provides linear filtering, rectification with variable power law exponent, and finite time averaging. The model is consistent with the physiological measure of average neural pulse rate. Simplified mathematical representations are employed to explain partial and complete masking. The Stevens law and a modified Weber law are derived as special cases. When extended to an array of sensors, a broadly significant pattern theory for recognition results which explains diplacusis and other phenomena. Direct electronic simulation may be achieved (and has) so as to yield solutions to problems which are too complex to be analyzed in other ways. (18 ref.)—*Journal abstract*.

7440. van Laer, John. (Northwestern U.) Response bias in psychophysical judgments: A test of Luce's model. *J. gen. Psychol.*, 1962, 67(2), 283-289.—Luce's theoretical account of time-order effects in psychophysical judgments was tested in the context of brightness discrimination. 4 Os each made 2000 absolute judgments of 3 stimuli, designated Light (L), Medium (M), and Dark (D), in 7 temporal sequences of presentation: M, M, M, and the 6 permutations of L, M, D. Obtained response probabilities were compared with theoretical probabilities computed from estimates of the parameters of Luce's model. The correspondence between theory and data was good for all Os. However, chi-square tests with results were statistically significant for 2 of the 4 Os.—*Author abstract*.

PERCEPTION

7441. Ammons, R. B., & Ammons, C. H. (Montana State U.) Perception bibliography: III. Baldwin's dictionary, 1883-1892. *Percept. mot. Skills*, 1962, 15(2), 559-562.—A continuing, unan-

notated bibliography appearing irregularly in this journal.—*W. H. Guertin.*

7442. Bakan, P. (Michigan State U.) **Retrospective awareness of error in time estimation.** *Percept. mot. Skills*, 1962, 15(2), 342.—If S makes a numerical estimate of an elapsed time interval and then makes a retrospective judgment of the accuracy of that estimate, does the accuracy judgment increase information about the temporal experience? When Ss judge the accuracy of a numerical estimate of a time interval they do so with some validity. Evidence that such a result is not specific to the conditions of this experiment is found in a paper by Wertheimer (see 29: 2042) who reported that Ss make better than chance judgments of auditory threshold judgments. It appears that degree of relationship between an overt verbal indicator and experience may be increased by elaboration of the indicator.—*W. H. Guertin.*

7443. Buck, Leslie. (University Coll., London, England) **Auditory perception of position and speed.** *J. appl. Psychol.*, 1963, 47(3), 177-183.—2 experiments were carried out to test the ability of train drivers to use sounds for the recognition of position and speed. The procedure involved playing tape recordings of 2 steam locomotives leaving known points and traveling at known speeds to experienced train drivers in a laboratory situation. Results show that Ss were able to recognize the position recordings better than predicted by chance, and that they were able to rank the speed recordings relative to each other, but they were not able to assign accurate values to the latter in terms of miles per hour. There were no significant differences in respect of the 2 locomotives.—*Journal abstract.*

7444. Davis, Roy. **L'estimation d'intervalles temporels en comptant plus ou moins rapidement.** [Estimation of time intervals at varying rates of counting speed.] *Annee psychol.*, 1962, 62(1), 29-44.—Variability in estimation is less for a rate of counting interval of .5 sec. than for any other value between .25 sec. and 4 sec. This effect is so marked that there is less variability in estimating 1-4 sec. when the optimum rate is .5 sec., than in estimating 1-2 sec. when a less favorable rate is used.—*G. Rubin-Rabson.*

7445. Garner, W. R., & Lee, W. (Johns Hopkins U.) **An analysis of redundancy in perceptual discrimination.** *Percept. mot. Skills*, 1962, 15(2), 367-388.—The total amount of discrimination which can be obtained depends on an interaction between the duration of the stimulus, the number of independent variables operating, and an ideal rate which is a measure of the basic discriminability of the single stimulus element. Maximum information transmission is obtained if both the stimulus variables and the corresponding perceptual processes are independent. If neither is independent, then discrimination cannot be improved. If, however, the perceptual processes are independent, then the stimulus variables can be made redundant and there can be a gain in discrimination. Illustrative data are presented from an experiment involving visual pattern discrimination.—*W. H. Guertin.*

7446. Gregg, Lee W., & Karn, Harry W. (Carnegie Inst. Technology) **Perceptual responses as a**

function of the sequential properties of multiple visual stimuli. *J. exp. Psychol.*, 1963, 65(2), 124-130.—Circles located at the points of a triangle were differentially loaded with runs of dots and no dots averaging 2, 4, and 8 in length. Different combinations of loading and location were tachistoscopically presented to 3 experimental groups with a control group receiving random dot and no-dot combinations at all locations. Experimental groups performed significantly better in terms of error reduction than did the control group. However, variance analysis failed to show an effect of run length, per se. Despite the statistical results, an effect of run length is suggested by an analysis in which straight lines were fitted to the data by the method of least squares.—*Journal abstract.*

7447. Harris, Charles S. (Harvard U.) **Adaptation to displaced vision: Visual, motor, or proprioceptive change?** *Science*, 1963, 140(Whole No. 3568), 812-813.—After seeing his hand through wedge prisms, an S points incorrectly with that hand at auditory as well as visual targets. The other hand is virtually unaffected. Thus, the change cannot be solely visuomotor or visual. Other evidence suggests that it is a change in felt hand location, rather than motor learning. When the S's adapted hand feels as if it is pointing straight ahead, for example, it is actually pointing off to one side.—*Journal abstract.*

7448. Immergluck, Ludwig. (San Francisco State Coll.) **Perceptual judgment as a function of context.** *Brit. J. Psychol.*, 1962, 53(4), 447-450.—Perceptual contrast has been traditionally demonstrated with stimulus attributes involving size, perspective, or brightness of given stimulus objects. The present investigation aims to examine the operation of perceptual contrast in such qualitative dimensions as geometric stability, symmetry, or general design quality of a stimulus. The results show that the stimulus figure, a square, was perceived as geometrically more perfect when presented in a disordered and unstable context as compared with an ordered and stable one.—*Journal abstract.*

7449. Kaswan, Jacques, & Young, Stephen. (U. California, Los Angeles) **Stimulus exposure time, brightness, and spatial factors as determinants of visual perception.** *J. exp. Psychol.*, 1963, 65(2), 113-123.—In a forced choice task, 5 Ss chose between linear displays of dots arranged in pairs or evenly spaced presented at 8 exposure times ranging from .004 to .512 sec. and 8 intensities ranging from .09 to 11.84 m.L. Intensity had little effect on accuracy. Accuracy was largely a function of exposure time and, for paired designs, the amount of relative spatial distance between to within pairs of dots. Detecting the presence or absence of stimuli was a joint function of exposure time and intensity and independent of relative spatial distance. The findings support the assumption that perception becomes differentiated over time, and indicate that relative spatial distance can be used as a stimulus measure of differentiation. A 2-phase process of the temporal development of perception is proposed.—*Journal abstract.*

7450. Klemmer, E. T. (IBM Research Cent., Yorktown Heights, N. Y.) **Perception of linear dot patterns.** *J. exp. Psychol.*, 1963, 65(5), 468-473.—Linear dot patterns were presented tachisto-

scopically by flashing randomly selected patterns on uniformly spaced light bulbs. The total visual angle was varied from 2.5° to 160° using 21 bulbs and, in a separate experiment, number of bulbs was varied from 11 to 35, using a fixed 1° spacing between bulbs. Perception was determined by a poststimulus cue requiring only a 1-bit response. Average accuracy of report was surprisingly insensitive to visual angle. The center bulbs were seen better than the end bulbs at all visual angles. When the spacing of bulbs was fixed at 1° and the number of bulbs increased from 11 to 35 the percent-error increased linearly with near perfect performance for 11 bulbs (poststimulus cue method). Comparison with previously reported data on the perception of linear dot patterns indicates that the earlier findings may have been due to memory rather than perception.—*Journal abstract.*

7451. McFarland, J. H. (Clark U.) Visual and proprioceptive changes during visual exposure to a tilted line. *Percept. mot. Skills*, 1962, 15(2), 322.—While S is vertical during exposure to a visual object tilted right, there are changes toward alignment in perceived orientation of the visual object tilted right and the vertical body axis, *vis.*, they appear rotated toward each other. The findings suggest that the tendency toward movement occurring during exposure to the tilted visual object plays a role in the observed perceptual changes.—*W. H. Guertin.*

7452. McFarland, J. H., Wapner, S., & Werner, H. (Clark U.) Relation between perceived location of objects and perceived location of one's own body. *Percept. mot. Skills*, 1962, 15(2), 331-341.—Under body tilt apparent body location (position at which body appears to be) is rotated beyond the physical body position in the direction of body tilt, whereas the apparent vertical (position of rod when perceived as vertical) is rotated beyond the physical vertical opposite the direction of body tilt. Under unsupported body tilt these changes increase for the apparent vertical and decrease for the body position. The results were interpreted in terms of the problem of constancy from an organismic point of view.—*W. H. Guertin.*

7453. Miller, Earl F., & Graybiel, Ashton. Rotary autokinesis and displacement of the visual horizontal associated with head (body) position. *USN Sch. Aviat. Med. NASA jt. res. Rep.*, 1963, Proj. MR005.13-6001, Subtask 1, Rep. No. 77; NASA Order R-47. ii, 10 p.—Continuous settings to the visual horizontal by the authors and 2 experienced test pilots were recorded during a 23-min. period. The background to the luminous line target was alternately illuminated for 2 min. then darkened completely for 5 min. All Ss performed in a similar and highly reliable manner, but the pilots manifested significantly less total error. In an upright position, the accurate and relatively stable perception of the horizontal was not appreciably influenced by the lack of visual cues; in a recumbent position, removal of these cues caused, after a brief lag period, a gradual spontaneous rotation of the phenomenal horizontal up to the maximum typical for each S. In addition, there was considerable fluctuant movement described as rotary autokinesis. These illusions disappeared almost instantaneously when the background was illuminated. Prolonged observation (30 min.) of the

target in the dark while recumbent resulted in a significant decrease in the illusion for one of the author Ss. (17 ref.)—*USN SAM & NASA.*

7454. Raab, David H. (Brooklyn Coll.) Backward masking. *Psychol. Bull.*, 1963, 60(2), 118-129.—In backward masking, perception of a test stimulus is suppressed by masking stimulation that is presented subsequently. Psychophysical studies of this phenomenon have utilized visual, auditory, and cutaneous stimuli. These masking studies are reviewed and their results discussed in terms of possible neural mediating mechanisms. (88 ref.)—*Journal abstract.*

7455. Segall, Marshall H., Campbell, Donald T., & Herskovits, Melville J. (U. Iowa) Cultural differences in the perception of geometric illusions. *Science*, 1963, 139 (Whole No. 3556), 769-771.—Data from 15 societies are presented showing substantial intersocietal differences of 2 types in susceptibility to geometric optical illusions. The pattern of response differences suggests the existence of different habits of perceptual inference which relate to cultural and ecological factors in the visual environment.—*Journal abstract.*

7456. Spence, Janet Taylor. (Northwestern U.) Contribution of response bias to recognition thresholds. *J. abnorm. soc. Psychol.*, 1963, 66(4), 339-344.—The influence of differential usage preference on verbal identification measures was investigated using a technique which closely mimics the typical recognition threshold investigation. Ss were unrestricted by E in their choice of responses and were presented with stimulus materials at varying duration levels. The stimuli, however, were presented in such a manner that Ss' partial perception could to some degree be controlled. These partial perceptions made 2 response alternatives equally appropriate, one a familiar word and the other a less familiar one. In 2 experiments varying in procedure, the frequency with which familiar responses occurred as guesses was significantly ($p < .01$) greater than the frequency of unfamiliar responses. (18 ref.)—*Journal abstract.*

7457. Spielberger, Charles D., & Denny, J. Peter. (Duke U.) Visual recognition thresholds as a function of verbal ability and word frequency. *J. exp. Psychol.*, 1963, 65(6), 597-602.—Effects of verbal ability and word frequency on visual-recognition thresholds were investigated. Words of low, moderate, and high frequency of occurrence in the Thorndike-Lorge word counts were tachistoscopically presented to college students selected on the basis of extreme scores on the ACE Linguistic scale. Inverse relationships were obtained between word frequency and recognition thresholds for both high and low verbal ability Ss. High ability Ss recognized low frequency words more rapidly than low ability Ss. (21 ref.)—*Journal abstract.*

7458. Thurlow, W. R. (U. Wisconsin) Probability of belonging in a given category as a determinant of perceived personality characteristics. *Percept. mot. Skills*, 1962, 15(2), 462.—S was presented with a photograph (head only) of a man, and was told that the photograph had been chosen at random from a set of 10 photographs, "x" of which were photographs of murderers. The value of "x" was made 0, 1, 3, 5, 7, 9, and 10, each value of "x" being used with a different photograph. Results showed

that for the category of "murderer," ratings of aggressiveness tended to increase, and ratings of self-control and honesty tended to decrease as probability of the photograph being that of a "murderer" increased. For the category "senator," ratings of self-control, honesty, and persuasiveness tended to increase as probability of the photograph being that of a senator increased.—*W. H. Guertin.*

7459. Wapner, S., McFarland, J. H., & Werner, H. (Clark U.) Effect of visual spatial context on perception of one's own body. *Brit. J. Psychol.*, 1963, 54(1), 41-49.—3 experiments, dealing with the effect of extension of surrounding visual spatial context on apparent size of body parts, were conducted. In the 1st 2 studies (48 Ss in each) the dependent variable was arm length, and in the 3rd study (24 Ss) the dependent variable was head width. It was found that apparent arm length and apparent head width are relatively larger in an "open-extended" visual spatial context than in a "close-confined" spatial context. These results are interpreted in keeping with developmental and sensory-tonic theory.—*Journal abstract.*

7460. Watanabe, T. (Okayama U., Japan) [An experimental study on the measurement of the threshold of closure phenomenon.] *Jap. J. Psychol.*, 1962, 33(3), 125-132.—The general purpose of the study was to determine whether tendency toward closure could be psychophysically measured. It was noted, while using diamond shaped figures, that the threshold of closure could be measured as a percentage of the perimeter of the figure presented compared with that of a complete one. It was concluded that it was possible to psychophysically measure the closure threshold and that the size of the threshold varied directly with the size of the apex angle so that figures with lower apex angles had lower thresholds.—*A. Barclay.*

Illusions

7461. Fox, B. H. (Cleveland Psychiatric Inst. & Hosp., O.) An unusual perception accompanying optokinetic nystagmus. *Percept. mot. Skills*, 1962, 15(2), 273-274.—In driving on a light road in sunlight, dark horizontal shadows or black tar lines seem to flicker in the periphery below while the gaze is centered on the road ahead. This may divert attention enough to increase hazard slightly. Possible sources of the phenomenon are suggested.—*W. H. Guertin.*

7462. Gruber, Howard E., King, William L., & Link, Stephen. (U. Colorado, Boulder) Moon illusion: An event in imaginary space. *Science*, 1963, 139(Whole No. 3556), 750-752.—The illusion was obtained with artificial moons viewed against a luminous ceiling, and also with an imaginary ceiling induced by first showing a luminous ceiling and then removing it before the moons were introduced.—*Journal abstract.*

7463. Smith, O. W., & Smith, P. C. (Cornell U.) An illusion of parallelism. *Percept. mot. Skills*, 1962, 15(2), 455-461.—An illusion of parallelism is reported in which the longitudinal axes of 2 physically parallel objects in an unrestricted everyday environment do not appear parallel. When Ss cause E to adjust a nearby pointer to appear parallel to a distant standard, large systematic errors at-

tributable to the illusion are obtained. The illusion is apparent to most Ss, in that when standard and variable appear parallel, Ss can perceive that they are not physically parallel. Individual differences in perceiving the illusion are moderately correlated.—*W. H. Guertin.*

Aftereffects

7464. Bakan, Paul, & Weiler, Ernest. (Michigan State U.) Kinesthetic aftereffect and mode of exposure to the inspection stimulus. *J. exp. Psychol.*, 1963, 65(3), 319-320.—Measures of kinesthetic aftereffect were taken on 3 groups of 48 Ss, differing in type of exposure to an inspection stimulus. Largest aftereffects were found for the group experiencing passive movement and smallest aftereffects were found for the group experiencing no movement of the inspection stimulus between thumb and index finger. A group experiencing active movement showed aftereffects intermediate in size between the other 2 groups. Results support a hypothesis of a relationship between attention, neural satiation, and aftereffects.—*Journal abstract.*

7465. Bakan, Paul, & Mizusawa, Kiyoe. (Michigan State U.) Effect of inspection time and direction of rotation on a generalized form of the spiral aftereffect. *J. exp. Psychol.*, 1963, 65(6), 583-586.—The spiral aftereffect, an apparent expansion or contraction of a spiral after fixation of the rotating spiral, is produced in a more general form as an apparent expansion or contraction of a square after fixation of a rotating spiral. Duration of the spiral-square aftereffect is a positive function of time of inspection of the spiral. Duration of the aftereffect is longer for the apparently expanding aftereffect than for the apparently contracting effect. Duration of the aftereffect appears to be influenced by the nature of the postrotation stimulus upon which it is projected. (21 ref.)—*Journal abstract.*

7466. Bakan, P., & Thompson, R. (Michigan State U.) On the relation between induced and residual kinesthetic aftereffects. *Percept. mot. Skills*, 1962, 15(2), 391-396.—The purpose of the investigation was primarily to determine the relationship between induced and residual kinesthetic aftereffect. Aftereffect was induced by 45-sec. stimulation with an inspection object. Correlation of residual effect measured a week later and induced effect was 0.647. A week after the 45-sec. inspection period a 10-min. inspection period was added, and a measure of residual aftereffect was taken a month later. Correlation between total induced aftereffect and the residual a month later was 0.720. The absolute size of aftereffect induced was found to be related to the pre-inspection judgment of the standard stimulus. Results are discussed in terms of similarities between learning and aftereffects.—*W. H. Guertin.*

7467. Eysenck, H. J. (U. London, England) Figural aftereffects, personality, and inter-sensory comparisons. *Percept. mot. Skills*, 1962, 15(2), 405-406.—It is argued that the measurement of figural aftereffects involves 2 antagonistic processes, and that failures to obtain correlations between visual aftereffects and kinesthetic aftereffects, as well as failure to obtain correlations of either with personality, may be due to disregard of the importance of controlling length of inspection periods properly.—*W. H. Guertin.*

VISION

7468. Dixon, N. F. (University Coll., London, England) **Apparatus: The recording of continuous variation along four dimensions.** *Quart. J. exp. Psychol.*, 1963, 15(1), 67-70.—A system is described for signalling, recording, and analysing continuous changes in up to 4 dimensions applicable to the visual after-image and other phenomena. Some advantages of the method are discussed.—*Journal abstract.*

7469. Kanizsa, G., & Metelli, F. **Recherches expérimentales sur la perception visuelle d'attraction.** [Experimental studies of perceived attraction.] *J. Psychol. norm. pathol.*, 1961, 4, 385-420.—These studies stem from Michotte's work on the perception of causality. In a series of experiments the authors examine the stimulus conditions for the perception of attraction of one visual object by another. They conclude that Michotte's formulation covers most, but not all the conditions investigated.—*M. L. Simmel.*

7470. Spigel, I. M. (U. Pittsburgh School Medicine) **CFF and surrounds of simultaneous contrast.** *Percept. mot. Skills*, 1962, 15(2), 275-281.—An experiment was designed to examine the effects of apparent surround luminance on CFF with objective illumination controlled. Surrounds producing differential simultaneous contrast were employed for the manipulation of apparent luminosity. It was found that the CFF did not vary with apparent brightness of the immediate gray surround, but was significantly higher when the inner area was bounded by components of higher luminosity, even when the total target luminosity was equal. Theoretical implications were noted.—*W. H. Guretin.*

7471. Weston, H. C. **Sight, light and work.** London, England: H. K. Lewis, 1962. xi, 283 p. £3 5s.—This revision of *Sight, Light and Efficiency*, originally published in 1949, considers problems associated with vision in industrial situations from a practical point of view. Anatomy and physiology of the eye, the nature, and causes of visual strain are reviewed. The specific demands of various kinds of visual tasks are considered in detail. Chapters are devoted to techniques for facilitating visual tasks, the lighting of working spaces or areas, and color. Various methods of testing visual ability and performance are treated in detail. The final chapter deals with various aspects of sight protection. An appendix summarizes British statutory requirements for lighting in various industrial situations.—*J. L. Brown.*

Space Perception

7472. Barlow, H. B. (Physiological Lab., Cambridge, England) **Slippage of contact lenses and other artefacts in relation to fading and regeneration of supposedly stable retinal images.** *Quart. J. exp. Psychol.*, 1963, 15(1), 36-51.—After-image experiments reveal that scleral-fitting contact lenses slip through several min. of arc. Experiments in which they have been used to procure "stabilized" retinal images must therefore be reinterpreted. Light-weight, suck-on, limbal-seating cups are much better, but complete stabilization cannot be relied upon. Other possible artefacts in stabilized image work are described and are thought to be responsible for certain features of previous accounts of the ap-

pearance of stabilized images. Discounting features caused by artefacts, the image appears to blur losing detail and fade losing contrast within the 1st few sec. Contrast and detail are not regained, but the milky, textureless image that remains fluctuates in appearance for a minute or so. Finally the fluctuations die out and a very blurred, cloudy version of the original scene persists. (23 ref.)—*Journal abstract.*

7473. Cornwell, Henry G. (Lincoln U.) **Prior experience as a determinant of figure-ground organization.** *J. exp. Psychol.*, 1963, 65(2), 156-162.—The failure to reproduce Rubin's aftereffect reported by Rock and Kremen (1957) was hypothesized as due to the absence from their training figures of the same black-white context that existed in their ambiguous test figures. This context was provided in the present experiment by training Ss in figure perception with reversible but unbalanced black-white designs, and subsequently testing them with identical contours in balanced designs. Comparison (chi square) of experimental and control Ss' responses to test designs revealed a significant effect ($p < .02$): Ss perceived the same figure-ground organization in the ambiguous test designs that they had perceived in the training designs.—*Journal abstract.*

7474. Epstein, William, & Park, John N. (U. Kansas) **Shape constancy: Functional relationships and theoretical formulations.** *Psychol. Bull.*, 1963, 60(3), 265-288.—In the 1st section empirical findings concerning shape constancy are reviewed under 10 headings: The Occurrence of Compromise, Conditions of Observation, Degree of Orientation, Observation Attitude, Familiarity and Representativeness, Differences Between Forms, Individual Differences and Individual Consistency, The Effects of the Background, Movement, Exposure Time and Intensity. The 2nd section deals with several theoretical accounts of shape constancy. The shape-slant invariance hypothesis is evaluated in the light of the experimental evidence and is judged to be equivocal. A line of investigation is proposed which might reconcile the experimental data with the requirements of this hypothesis. The final section of the paper considers the methodological precautions which need to be observed in experimentation on apparent shape and apparent slant. (54 ref.)—*Journal abstract.*

7475. Field, L. G. Hanscom. **Form perception in video viewing: Effects of resolution degradation and stereo on form thresholds.** *USAF ESD tech. docum. Rep.*, 1962, No. 63-136.—Thresholds for video viewing of randomly constructed forms are determined under conditions of pictorial degradation and stereoscopic presentation. Form recognition is not significantly enhanced by stereo viewing but discrimination threshold is reduced. All form thresholds are highly sensitive to video image degradation. Video acuity is not significantly related to video form thresholds and can be affected by orientation of a pattern in relation to video scan lines. (19 ref.)—*USAF ESD.*

7477. Gogel, Walter C. (FAA Civil Aeromedical Research Inst., Oklahoma City) **The visual percep-**

tion of size and distance. *FAA Civ. Aeromed. Res. Inst. Rep.*, 1962, No. 62-15. 19 p.—“The perception of absolute distance has been assumed to be important in the perception of the size of objects and the depth between them. A different hypothesis is proposed. It is asserted that perceived relative size and distance are the primary psychological phenomena, with perceived absolute distance derived from the perceptual summing of perceived relative depths. In agreement with this point-of-view, it is stressed that relative, rather than absolute retinal extents, are the determiners of visually perceived extents. A principle called the ‘adjacency principle’ is identified as perceptually organizing the relative retinal stimuli. This principle states that the apparent size or position of any object in the field-of-view is determined by whatever size or distance cues occur between it and adjacent objects. Some evidence for the adjacency principle is discussed and some consequences of the principle are considered.”—*W. E. Collins.*

7478. Holt-Hansen, Kristian. Oscillation experienced in the perception of figures. *Kong. Danske Vidensk. Selsk., Hist.-fil. Medd.*, 1962, 39(7), 48 p.—“A qualitative and quantitative description of oscillations in the perception of figures experienced in a series of experiments, the figures being sometimes projected onto a screen, sometimes illuminated by stroboscopic light in a dark optical box. . . . Experiments with polarized light suggested that the experienced oscillations are partly a result of central processes.”—*C. T. Morgan.*

7479. Schmidtke, H. (Max-Planck-Inst., Dortmund, Germany) Über Mikropsieerscheinungen in der Gesichtswahrnehmung. [Experiments on “micropsy” phenomena in visual perception.] *Psychol. Beih.*, 1962, 7(2), 285-295.—It is demonstrated that widening the convergence angle of the visual axis in constant accommodation leads to “micropsy” phenomena in visual perception. The convergence conditioned “micropsy” was measured by comparing the size of presented visual objects (black circles and photographs of coins) necessary for the recognition of the equivalent size and the calculated convergence distance. Results are discussed on the basis of a theory of size constancy of visual objects. (English & French summaries)—*H. J. Priester.*

7480. Walsh, E. G. (U. Edinburgh, Scotland) The perception of rhythmically repeated linear motion in the horizontal plane. *Brit. J. Psychol.*, 1962, 53(4), 439-445.—Normal Ss were subjected to linear motion rhythmically repeated at rates in the range 1 to 1/2 cps. With horizontal oscillations of 1/2 cps, the sensations of moving came at the turning-points of the swing. The person felt he was moving most rapidly when he was momentarily stationary. The CNS interprets acceleration as velocity under these circumstances. At times the first sensation of moving in one direction came whilst the person was travelling rapidly in the opposite way. At 1 cps the sensations were in time with the movements as they occurred. Threshold data indicate that the peak acceleration adequately describes the stimulus at 1/2 and 1/3 cps. The findings are discussed in relation to the behavior of the otolith organs and may have a bearing on possible explanations of motion sickness.—*Journal abstract.*

Color Vision

7481. Bardin, K. V. (RSFSR Acad. Pedagogical Sciences) Kharakteristike priemov resheniia sensornykh zadach na razlichenie i vosproizvodenie tsveta. [Different approaches in solving problems of color discrimination and reproduction.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1962, No. 3, 99-102.—Ss were instructed to reproduce and to discriminate given colors by manipulating a color wheel. The searching movements were recorded on a kymograph. Analysis of movements shows certain patterns corresponding to different functions such as orientation, control, and performance of the tasks.—*A. Cuk.*

7482. Crovitz, Herbert F., & Lipscomb, D. Barry. (VA Hosp., Durham, N. C.) Binasal hemianopia as an early stage in binocular color rivalry. *Science*, 1963, 139(Whole No. 3555), 596-597.—50 years ago Köllner reported that the initial fleeting sensation in binocular color rivalry is a bipartite color field such that the color presented to the left eye appears to the left of the color presented to the right eye. A method is described for maintaining such quasi hemianopia for long periods of time.—*Journal abstract.*

7483. Lobanova, N. V., & Rautian, G. N. O predelenie spektral'noi chuvstvitel'nosti priemnikov setchatki is opytov s dikhromatami. [On the determination of spectral sensitivity of receptors of the retina from experiments with dichromates.] *Dokl. Akad. Nauk SSSR*, 1962, 146(5), 1193-1196.—Using the assumption that the cause of dichromatism is a lack of functioning of a particular type of receptor, the investigators determined the spectral sensitivity of the missing receptor. The method essentially consisted of the determination of colors not differentiated by dichromates from a given color. All these colors are differentiated among themselves only by the magnitude of activity of this nonfunctioning receptor. 16 protanopes and 16 deutanopes served as Ss. On this basis, sensitivity curves were elaborated for 3 color receptors of the retina.—*H. Pick.*

7484. Shurtleff, D., & Dimascio, A. (Massachusetts Mental Health Cent., Boston) Stimulus generalization and stimulus discriminability: Effects of perphenazine. *Percept. mot. Skills*, 1962, 15(2), 439-442.—17 college students were asked to distinguish between visual stimuli, varying in wavelength, by depressing one key when they saw the standard stimulus and a 2nd key when any other stimulus was presented. The shapes of the gradients for the frequency of correct responses, in most cases, were consistent with predictions derived from the assumption of an inverse relationship between generalization and discrimination. Although no statistically significant differences between placebo and perphenazine were obtained, perphenazine tended to produce more asymmetrical gradients.—*W. H. Guertin.*

7485. Wienke, Richard E., & Schwartz, Ira. Effect of contact lenses on the red/green ratio. *USN Med. Res. Lab. Rep.*, 1960, 19(3, Whole No. 328), 2 p.—(Originally published in *Contacto*, 1959, 3(11), 379, 381.) It had been suggested that the retinal image size, due to ophthalmic correction, had an effect on color discrimination. This hypothesis was tested by using contact lenses, which tend to

equate image size regardless of ametropia. It was found that correctly fitted and powered contact lenses and spectacle corrections have no differential effect on the color discrimination task.—*USN MRL*.

Visual Sensitivity

7486. Amigo, George. (U. New South Wales, Sydney, Australia) Variation of stereoscopic acuity with observation distance. *J. Opt. Soc. Amer.*, 1963, 53(5), 630-635.—The stereoscopic acuity of 5 Ss was investigated in 2 consecutive and related studies. In the 1st one a modified horopter apparatus was used and the stereoscopic acuity was determined, at a mean retinal locus of 4° to the left of the fovea, at the 333- and 1000-mm. observation distances. 2 types of fixations were used, and the exposure time was kept above 1 sec. The results indicated a significant variation of the stereoscopic acuity with observation distance. In the 2nd investigation a haploscopic apparatus was used to study the stereoscopic acuity at a mean retinal locus of 4° and $\frac{1}{2}^\circ$ to the left of the fovea, at 500, 750, 1000, 1500, and 2000 mm. for the 4° and at 500, 750, and 1000 mm. for the $\frac{1}{2}^\circ$ locations. The duration of the stimulus was accurately controlled by a mirror-shutter. The exposure times used were 0.05, 0.10, 1.00, and 2.00 sec. Fixation was central, and all known physical variables were kept constant. The results again indicated a significant variation of the stereoscopic acuity with the observation distance. The possible implications of this finding are discussed.—*Journal abstract*.

7487. Kinney, Jo Ann S. (USN Medical Research Lab., Groton, Conn.) Night vision sensitivity during prolonged restriction from sunlight. *J. appl. Psychol.*, 1963, 47(1), 65-67.—The night vision sensitivity of a group of 24 men was tested monthly during the 3-month submerged cruise of the Triton. There was no evidence in the test scores that night vision sensitivity can be improved beyond its seasonal peak by further restriction from sunlight.—*Journal abstract*.

7488. Over, Ray. (Queen's U., Belfast, Ireland) Brightness judgments and stimulus size and distance. *Brit. J. Psychol.*, 1962, 53(4), 431-438.—3 groups of Ss were instructed to judge the relative brightness of 2 stimuli, the sizes and distances of which were varied to allow 3 visual angle relationships. Testing was carried out under reduced viewing conditions and the groups differed in terms of the criteria Ss were instructed to use in making brightness judgments. For all groups it was found that when the 2 stimuli were equal in luminous intensity the stimulus subtending the smaller visual angle was consistently judged to be less bright than the stimulus subtending the larger visual angle. Judgments made with "projective" criteria were more a function of stimulus size and distance than were judgments made with either "objective" or "apparent" criteria.—*Journal abstract*.

7489. Thorsby, Adrienne. (U. Sidney, Australia) Proportion of light to cycle as a determinant of critical flicker-fusion frequency. *Psychol. Bull.*, 1962, 59(6), 510-519.—On the basis of recent studies a meaningful relationship between CFF and the proportion of light to the total cycle (P_L) is emerging. Graphs of the Log of time of one dark period to time of one light period "show that increase in time of

light, luminance and/or area of test patch, results in a decrease in the time of dark necessary at fusion."—*W. J. Meyer*.

Eye Movements

CHEMICAL SENSES

7490. McBurney, Donald H., & Pfaffmann, Carl. (Brown U.) Gustatory adaptation to saliva and sodium chloride. *J. exp. Psychol.*, 1963, 65(6), 523-529.—Human NaCl thresholds were measured under 2 conditions: (a) salivary influence excluded by rinse with distilled water or 1 of 3 weak concentrations of NaCl between stimulations, and (b) salivary influence maximized by using no rinse. Adaptation to distilled water yielded a median threshold for 4 Ss of .00014 M vs. .0043 M for adaptation to saliva. The latter value approximated the resting concentration of sodium in the saliva of these Ss. Adaptation to saline solutions raised the thresholds to values slightly above each of the adapting concentrations. It is concluded that salt thresholds normally reflect the state of adaptation to salivary sodium. Changes in general physiological state of the organism which affect salivary composition might be expected to shift the taste threshold by a process of sensory adaptation. (24 ref.)—*Journal abstract*.

7491. Michels, K. M., Phillips, D. S., Wright, R. H., & Pustek, J., Jr. (Purdue U.) Odor and olfaction: A bibliography, 1948-1960. *Percept. mot. Skills*, 1962, 15(2), 475-529.—A "reasonably complete" bibliography of 601 items.—*W. H. Guertin*.

SOMESTHESIS

7492. Bergstedt, Martin. (Karolinska Inst., Stockholm, Sweden) The effect of gravitational force on the vestibular caloric test. *Acta oto-laryngol., Stockholm*, 1961, 53(6), 551-562.—Vestibular caloric tests were carried out on 4 Ss at 1 g, 1.25 g, 1.5 g, and 1.8 g in a large centrifuge. The experiments showed that: (a) vestibular caloric tests are influenced by the strength of the gravitational field, (b) the maximum intensity of nystagmus increases with higher values of g, (c) this increase is in direct proportion to the increase in the gravitational field strength, (d) the latency period decreases with higher values of g, (e) the results are the same with cold and hot water irrigation. It is also shown that the duration increases with higher g-values but the material relating to this factor is not complete. An extrapolation of the result towards values of g less than 1 tend to show that there is no nystagmus in conditions of weightlessness and that the liminal value for nystagmus is about 0.1 g. An investigation involving the caloric test and preponderance at higher g-loads is planned.—*Journal abstract*.

7493. Brandt, Ulf. (Karolinska Inst., Stockholm, Sweden) The cause and practical importance of oculogravic illusions. *Acta Oto-laryngol., Stockholm*, 1962, 54, 127-135.—The oculogravic illusion can be interpreted as a specific otolith response to a stimulus consisting of linear acceleration. It has been suggested as a conclusive proof that the phenomenon does not occur in deaf Ss with labyrinthine areflexia. 2 fresh cases of acquired labyrinthine areflexia have been examined in the human centrifuge, the illusion being measured by a special technique. Although abnormal illusion curves much unlike those recorded in

the congenitally deaf may be obtained at the end of the "destructive stage," complete compensation with illusion curves resembling those of healthy individuals developed in a comparatively short time. The logical conclusion would be that oculogravic illusion cannot be accepted straight off as a selective measure for otolith sensitivity. In connection with a discussion of analogies, comparing oculogravic and oculogyral illusion, the author suggests that the "lag effect" (i.e., the time necessary for reorientation on rapid changes of the angle of incidence of the resultant vector) may offer a more adequate expression for static sensibility. The recent advances in the methods of observing these labyrinthine illusions should add to our somewhat unverified knowledge of vestibular physiology and pathology.—*Journal abstract.*

7494. Chumak, A. IA. (Moscow U., USSR) *Analiz sistemnogo stroeniia vospriiatiia: Soobshchenie X. Opyt formirovaniia razichitel'noi vibratsionnoi chuvstvitel'nosti.* [Analysis of the systemic structure of perception: Communication X. Formation of discriminatory sensitivity to vibration.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1962, No. 3, 83-86.—4 Ss were trained to discriminate vibrations of same and different intensities and frequencies. In a 2nd step, they had to vocalize the same intensities and frequencies. The result was a decrease in all thresholds.—*A. Cuk.*

7495. Clark, Brant, & Graybiel, Ashton. (San Jose State Coll.) *Perception of the postural vertical in normals and subjects with labyrinthine defects.* *J. exp. Psychol.*, 1963, 65(5), 490-494.—9 normal men and 10 men with vestibular defects were studied in a lateral tilt chair for 30 successive settings to the postural vertical. A significant decrease in the average error was found for both groups. The normal Ss exhibited smaller average errors; however, the differences were small particularly after 15 trials and were not statistically significant. (16 ref.)—*Journal abstract.*

7496. Collins, William E. (FAA Civil Aeromedical Research Institute, Oklahoma City) *Manipulation of arousal and its effects on human vestibular nystagmus induced by caloric irrigation and angular accelerations.* *FAA Civil Aeromed. Res. Inst. Rep.*, 1962, No. 62-17. 12 p.—Investigations concerned with the effects of subjective states on vestibular nystagmus were reviewed. Methods of controlling such states were discussed. Data indicate that the significant factor in S orientation during vestibular stimulation is a state of arousal, defined in terms of mental activity. Continuous, concerted attending to a task yields a brisk, long-duration nystagmus. If responses to a task require less attention with repetition, or if Ss are not kept alert, a significant reduction in nystagmus output may occur. Knowledge of subjective states is a prerequisite for proper evaluation of vestibular responses.—*W. E. Collins.*

7497. Fluor, Erik. (Karolinska Inst., Stockholm, Sweden) *The mechanism of nystagmus.* *Acta Oto laryngol., Stockholm*, 1962, 54(2), 181-188.—In 6 persons with spontaneous vertical nystagmus behind closed eyes, concurrent horizontal nystagmus was induced by caloric irrigation of the horizontal semicircular canals in the vertical position. This procedure caused no change in the vertical nystagmus

pattern. When the horizontal nystagmus subsided, the number of eye movements decreased, whereas the vertical nystagmus continued unchanged. The rapid phases of horizontal and vertical nystagmus invariably coincided even if the 2 types otherwise differed in frequency. The mechanism eliciting nystagmus is discussed, the following conclusions being drawn: (a) the slow phase of horizontal and vertical nystagmus is controlled from separate independent centers, (b) the rate of the slow phase is influenced by both peripheral and central factors, (c) the rapid phase is elicited from a center common to horizontal and vertical nystagmus, (d) the mechanism of nystagmus is controlled from the extraocular muscle nuclei but may be affected by various centers.—*Journal abstract.*

7498. Fluor, E. (Karolinska Inst., Stockholm, Sweden) *Efferent influence on vestibular function following unilateral labyrinthectomy.* *Acta otolaryngol., Stockholm*, 1961, 53(6), 571-577.—Central compensation following unilateral labyrinthectomy has been studied and discussed in an earlier paper (Fluor, 1960). By depressing the activity in the intact labyrinth by means of cold water irrigation, it was possible to demonstrate a gradual return of the normal function via compensatory activation of the vestibular nuclei on the labyrinthectomized side. Barany (1906, 1907) conducted rotary tests on patients bereft of one labyrinth due to acute labyrinthitis. He found far greater sensitivity to ampullopetal than to ampullofugal endolymph currents, and sought to explain the phenomenon on the basis of Ewald's (1892) view that the horizontal semicircular ducts had a unidirectional sensitivity which could come into play only after loss of one labyrinth. Cawthorne, Fitzgerald, & Hallpike (1942) reported caloric tests of patients who had undergone unilateral labyrinthectomy; they too, demonstrated increased sensitivity to ampullopetal endolymph currents. They termed this phenomenon "directional preponderance" and attributed it to conversion of the normal bi-directional sensitivity "into an abnormal uni-directional type." Since different authors have placed different interpretations on their results, it has been considered worth while to investigate the possible effects.—*Journal abstract.*

7499. Graybiel, Ashton, & Johnson, Walter H. *A comparison of the symptomatology experienced by healthy persons and subjects with loss of labyrinthine function when exposed to unusual patterns of centripetal force in a counter-rotating room.* *USN Sch. Aviat. Med. NASA jt. res. Rep.*, 1962, Proj. MR005.13-6001, Subtask 1, Rep. No. 70; NASA Order R-47. ii, 15 p.—Normal Ss and deaf persons with bilateral labyrinthine defects were exposed to unusual patterns of linear acceleration in an attempt to disturb normal functional mechanisms in the brain stem. Through the use of a counter-rotating room it was possible, at the same time, to avoid angular or Coriolis acceleration. Some of the normal but none of the labyrinthine defective Ss experienced motion sickness. The results are discussed in terms of the etiologic role of the vestibular sensory organs.—*USN SAM & NASA.*

7500. Harris, Charles S., Guedry, Frederick E., & Graybiel, Ashton. *Positional alcohol nystagmus in relation to labyrinthine function.* *USN Sch. Aviat. Med. NASA jt. res. Rep.*, 1962, Proj. MR005.

13-6001 Subtask 1 Rep. No. 76; NASA Order R-47. ii, 19 p.—The main objective was to evaluate the use of positional alcohol nystagmus (PAN) as an indicator of otolith function. Individuals without functional labyrinths did not exhibit nystagmus comparable in quality or magnitude to results obtained from a group of normal Ss. Several individuals suspected of having residual otolith function exhibited weak responses reminiscent of PAN, but the "responses" may have been attributable to artifacts. A relationship was found in normal Ss between nystagmus obtained by caloric stimulation and nystagmus obtained by positional alcohol testing. The relationship between nystagmic output and arousal was found to be essentially the same for positional alcohol nystagmus as for nystagmus obtained by other procedures. All labyrinthine-defective Ss tested for alcohol gaze nystagmus exhibited alcohol gaze nystagmus. (21 ref.)—*USN SAM & NASA*.

7501. Lindvall, H. F. (Serafimerlasarettet, Stockholm, Sweden) **Vertigo and nystagmus responses to caloric stimuli repeated at short and long intervals.** *Acta oto-laryngol., Stockholm*, 1961, 53(6), 507-518.—Experiments on 50 young, and, from an otoneurological point of view, "normal," Ss, showed a decline of the average vertigo and nystagmus responses to repeated monaural caloric stimulations with water at 30° C. This response decline (RD) occurred both at short (8 min.) and long (24 hr. or more) interstimuli intervals, which indicates that a central mechanism was responsible for this phenomenon. Statistical analysis disclosed some traits in the response pattern characteristic of habituation. Of practical interest is the observation that, even when an interval of 2 weeks elapsed between the 1st and 2nd irrigations the nystagmus response to the 2nd irrigation was significantly weaker. This RD was more marked in latency, total number of beats and dysrhythmia than in the duration of the nystagmus response.—*Journal abstract*.

7502. Miller, Earl F. **Counterrolling of the human eyes produced by head tilt with respect to gravity.** *USN Sch. Aviat. Med. res. Rep.*, 1962, Proj. MR005.13-6001, Subtask 1, Rep. No. 75. ii, 32 p.—A photographic method of measuring counterrolling yielded, on the average, a precision of ± 5.3 minutes of arc. With this method torsional eye movements compensatory to head (body) tilt were found in all planes tested except the sagittal. In 2 intermediate planes the overall counterrolling response was quite similar but somewhat less than that found in the case of lateral tilt. Counterrolling always occurred opposite to the lateral component of head tilt and increased fairly rapidly up to a maximum at a head inclination of between 60° and 90°. From this point on counterrolling decreased but at a lesser rate than it increased, reaching about zero when the head was positioned vertically downward. A difference in absolute amount of torsion of the right eye found between tilting the head (body) leftward and rightward could not be established. However, no difference in counterrolling could be attributed to the order in which the measurements were made. Variability in counterrolling response was found to be considerable at every position of tilt. A theory attempting to explain the mechanism of otolith organ stimulation is presented. (34 ref.)—*USN SAM*.

7503. Sternbach, Richard A. (Massachusetts General Hosp., Boston) **Congenital insensitivity to pain: A critique.** *Psychol. Bull.*, 1963, 60(3), 252-264.—No available reported case of apparent congenital pain insensitivity meets strict requirements for the syndrome. 17 "probable" cases are so neurologically and behaviorally heterogeneous that there appear to be several kinds of insensitivities with variations in the nature and/or locus of their neural deficits. The possible kinds of such deficits are discussed. The ability of these persons to survive is seriously impaired and depends on their ability to use other sensory cues of tissue damage. Normal personality development is rarely affected by the absence of pain. (64 ref.)—*Journal abstract*.

HEARING

7504. Coleman, Paul D. (School Medicine, Johns Hopkins U.) **An analysis of cues to auditory depth perception in free space.** *Psychol. Bull.*, 1963, 60(3), 302-315.—Physical acoustics reveals a number of stimulus correlates of sound source distance. Quantitative estimates of these stimulus correlates are compared with appropriate psychophysical thresholds. Such comparisons show that most of these stimulus correlates can, with various restrictions, provide distance information detectable by the ear(s). The stimulus correlates dealt with at greatest length are: intensity, frequency spectrum at near and far distances, binaural intensity ratio, and interaural phase (or time) differences. Problems relating to the use of some of these stimulus correlates as cues are discussed. Other possible distance cues are briefly mentioned. The possible use of much of the available physical information in making distance judgments has not yet been adequately evaluated in psychophysical studies. (48 ref.)—*Journal abstract*.

7505. Djupesland, Gisle. (Namsos, Norway) **Intra-aural muscular reflexes elicited by air current stimulation of the external ear.** *Acta Oto-laryngol., Stockholm*, 1962, 54(2), 143-153.—A review is given of the intra-aural muscular reflexes elicited by air current stimulation of the external human ear. Air current stimulation is advantageous compared with acoustic stimulation, being independent of the hearing in the contralateral ear, provided the reflex path is intact. The diagnostic scope of impedance measurements is thus substantially increased.—*M. Loeb*.

7506. Haeff, Andrew V., & Knox, Cameron. (Acoustica Associates, 5331 West 104th St., Los Angeles, Calif.) **Perception of ultrasound.** *Science*, 1963, 139(Whole No. 3555), 590-592.—Ultrasonic vibrations can be perceived as audible sounds when a piezoelectric transducer is pressed against certain areas of the human body. In the range of frequencies investigated (20 to 108 kc/sec), the threshold of perception seemed to lie near the threshold of feeling (about 10^{-4} watt/cm²), and the perceived audible sound appeared to be between 8 and 9 kc/sec as judged by 6 test Ss. The threshold of perception and the perceived frequency appear to be dependent upon the hearing characteristics of the individual.—*Journal abstract*.

7507. Harris, J. Donald. (USN Medical Research Lab., New London, Conn.) **Loudness discrimination.** *J. speech hear. Disord. monogr. Suppl.*

1963, No. 11, 61.—The monograph consists of a series of experiments and reviews of the literature concerning loudness discrimination. Optional difference limens, just noticeable differences of Riesz' experiment, preliminary loudness matrix, the loudness discrimination area, the present status of loudness discrimination in oto-audiological clinics, loudness/masking at 1000 cps, parameters of the loudness/masking JND, loudness/masking for complex sounds, loudness-memory for masked pure tones, a large group study showing a wide range of individual ability, general discussion of the discrepancies in the literature and in these findings.—*M. F. Palmer.*

7508. Heller, Morris F. (Mount Sinai Hosp., NYC) **Vibratory tinnitus and palatal myoclonus.** *Acta oto-laryngol., Stockholm*, 1962, 55(4), 292-298.—2 female patients with vibratory tinnitus and spontaneous palatal myoclonus are reported. 1 male patient with vibratory tinnitus and voluntary palatal myoclonic movements is described. The tinnitus was heard only when the palatal muscles and salpingopharyngeus muscles contracted and the tubal orifices are closed. The tinnitus can be heard both by the patient and by other persons. No common etiology could be determined. No specific treatment has been delineated.—*Journal abstract.*

7509. Kinsler, Lawrence E., & Frey, Austin R. (USN Postgraduate School, Monterey, Calif.) **Fundamentals of acoustics.** (2nd ed.) New York: Wiley, 1962. vii, 524 p.—A textbook designed for seniors and graduate level courses. Equations and laws of acoustics are developed from the fundamental principles underlying the generation, transmission, and reception of acoustic waves. About 1/2 of the book is devoted to these fundamental principles while the remainder contains applications, including a 39-page chapter entitled "Speech, Hearing and Noise."—*A. M. Small, Jr.*

7510. Norlund, Bertil. (U. Goteborg, Sweden) **Physical factors in angular localization.** *Acta Oto-laryngol., Stockholm*, 1962, 54(1), 75-93.—The investigation was carried out for the purpose of clarifying the acoustic differences which arise between the ears at different azimuths. Measurements of time, phase and intensity differences of the sound entering the ears of a dummy head were performed with the sound source placed at different azimuths around the head, and using the frequencies 500, 1000, 2000, 4000, and 8000 cps, with the sound source 165 cm. from the head. The results indicate that the time difference constitutes a linear function of azimuth between the angles of 0°-60° and between 120°-180°. The same thing applies to the phase difference, if expressed in time. The difference in intensity appears to be a very irregular function of azimuth and has to a great extent failed to agree with previously published findings. The matter of directional hearing is discussed on the basis of physical measurements and data obtained.—*Journal abstract.*

7511. Rankin, Richard J. (Oklahoma State U.) **Auditory discrimination and anxiety.** *Psychol. Rep.*, 1962, 11(2), 391-394.—"Ss (N = 117) were administered the Taylor Manifest Anxiety Scale and these scores were correlated with those for six variables found in the Seashore Measures of Musical Talents. Significant relationships were found between the Taylor Manifest Anxiety Scale and meas-

ures of loudness, time, and timbre. These results parallel those found in the literature for simple tasks. The need for further work with an auditory measure less restricted in range is indicated."—*B. J. House.*

7512. Rodda, M. (U. Canterbury, Christchurch, New Zealand) **Recovery from temporary threshold shift.** *Acta oto-laryngol., Stockholm*, 1962, 55(5-6), 553-562.—This study reports work in which recovery from temporary threshold shift (TTS) was studied by measuring the time taken for the elevated threshold to recover to normality (i.e., the latent time). It was found that with stimulus frequencies of 1000 and 2000 cps latent time increases as the stimulus intensity is raised from 20 to 60 db., decreases as the stimulus intensity is increased from 80 to 90 db. With 4000 and 8000 cps stimulus frequencies it was found that there is a gradual, negatively accelerating increase in latent time with increasing stimulus intensities. Latent times were found to be maximum at 4000 cps and minimum at 1000 cps, and increases in latent time at 4000 and 8000 cps paralleled each other. It is suggested that the results offered indirect evidence that recovery from TTS is diphasic. The author suggests an explanation for the phenomenon based on facilitatory effects within the cochlea.—*Journal abstract.*

7513. Schubert, Earl D. (Indiana U.) **Interpretation of the Butler-Naunton localization shifts.** *J. Acoust. Soc. Amer.*, 1963, 35(1), 113.—It is suggested that shifts in localization of a sound in space under conditions of unilateral masking by a wide band noise are caused by a peripheral mechanism. By analogy to pitch matching experiments the position of the maximum of the basilar membrane displacement pattern is assumed to be moved basally in the masked ear with a consequent shift in source of timing information.—*A. M. Small, Jr.*

7514. Sørensen, H. (Aarhus, Denmark) **Initial auditory adaptation: II. In impaired hearing.** *Acta oto-laryngol., Stockholm*, 1962, 55(5-6), 443-456.—Initial auditory adaptation is the depression of the sensitivity of the ear which is observed immediately after low-intensity stimulation, and from which recovery is obtained within less than 1 second after the cessation of the stimulus.—*Journal abstract.*

Measurement

7515. Fletcher, J. L., & Loeb, M. (USA MRL, Ft. Knox) **The influence of different acoustical stimuli on the threshold of the contralateral ear: A possible index of attenuation by the intratympanic reflex.** *Acta Oto-laryngol., Stockholm*, 1962, 54(1), 33-37.—A previous attempt to assess the attenuation produced by the intratympanic muscle reflex involved determination of the increase in absolute threshold following contralateral pure tone stimulation. This estimate was considerably smaller than estimates of reflex attenuation obtained by other means. In the present study a 110-db. SL sine wave, square wave, narrow band noise, or broad band noise was introduced in one ear and the resultant threshold shift in the contralateral ear was measured. The smallest changes were produced by the square wave and pure tone stimuli. Appreciably larger threshold increases were elicited by the broad band and narrow band noises, especially the latter. Possible explana-

tions of the obtained differences are discussed.—*Journal abstract.*

7516. Maspétiol, R., Semette, D., & Mathieu, C. (Paris, France) **Le contrôle central de l'audition et ses tests audiométriques.** [Central control of audition and related audiometric tests.] *Acta Otolaryngol., Stockholm*, 1962, 54(1), 33-43.—This paper is concerned with the action of a weak contralateral sound on the auditory intensive difference limen. The study indicates the presence of inhibition and facilitation in central transmission of the auditory message and of a central control of the cochlea. The significance of the findings for certain clinical audiometric tests is examined. "From a neurosurgical point of view, these audiometric facts are the clinical expression of well-determined neuro-physiological processes, viz. the reticular control of central transmission of auditive messages and the interreaction of cortex and reticulated substance, the centrifugal reticulated effects acting on the receptor organ and the reticulo-hypothalamic effects."—*M. Loeb.*

7517. Nordlund, B. (Göteborg, Sweden) **Angular localization.** *Acta oto-laryngol., Stockholm*, 1962, 55(5-6), 405-424.—The investigation was carried out to develop a method for directional audiometry that will provide a test of the different functions in angular localization. The method has the following properties. (a) What we have called "physiological directional hearing," i.e., the ability to angular localization of a sound source in a free field, can be estimated. (b) Defective ability to discriminate interaural time, phase, and intensity differences can be detected individually. The sources of error of the method are carefully investigated with the aid of an artificial head. In future work this method for directional audiometry will be tested clinically in order to estimate the value angular localization may have for the topical diagnosis of hearing defects.—*Journal abstract.*

7518. Selters, Weldon. (Research Cent., Subcommittee on Noise, Los Angeles, Calif.) **Prediction of temporary threshold shift after noise increase.** *J. Acoust. Soc. Amer.*, 1963, 35(1), 99-103.—It has been reported previously that temporary threshold shift (TTS) can be predicted as a function of exposure time and level when the level is constant. The present results indicate: (a) After a noise-level increase, if exposure item is adjusted by the equivalent-exposure rule, the usual TTS function for the higher level will predict subsequent TTS growth. (b) Brief test periods introduce errors in exposure time, which may be corrected by multiplying the observed TTS by $(t_n + t_i)/t_n$ where t_n is exposure time and t_i is test time. (c) An acceleration in TTS seems to occur at about 6 min., thus new equations will be necessary to predict TTS for exposure times less than 6 min.—*A. M. Small, Jr.*

7519. Sørensen, Henning. (Aarhus, Denmark) **Initial auditory adaptation: I. In normal individuals.** *Acta oto-laryngol., Stockholm*, 1962, 55(4), 299-308.—The purpose of the present investigation was to elaborate an adaptation test for use in clinical routine and to establish normal values, so that the test could subsequently be applied in various forms of deafness. 74 normal Ss of all ages were tested. The initial adaptation was measured by the threshold rise of a short tone (30 msec.) applied 50 msec. after the

cessation of a pure-tone stimulus (1000 msec.). The frequencies of the stimulus tones were 250, 1000, and 4000 cps. The frequency of the test tone was at all frequencies $\frac{1}{2}$ octave above that of the stimulus tone. With this frequency interval the (threshold) shift was observed at stimulus intensities of 50-55 db. above the hearing threshold at all frequencies, with increasing age at lower intensities. The threshold rise at intensities 20 db. above incipient adaptation amounted to 12-14 db. at all ages.—*Journal abstract.*

Speech Perception

7520. Elliott, L. L. **Prediction of speech discrimination scores from other test information.** *USAF SAM tech. docum. Rep. 62-145*, 1962, No. 62-145, 13 p.—Performance on tests with Rush Hughes (RH) materials and with W-22 materials were correlated with speech discrimination scores. PB score in the nontest ear and difference between speech reception thresholds (SRT) in the test and nontest ears were the 2 best predictors. High validity coefficients occurred for the equation based on W-22 materials. Moderate validity coefficients occurred for the equation based on RH materials.—*M. C. Payne, Jr.*

PARAPSYCHOLOGY

7521. Banerjee, H. N. (Inst. Parapsychology, Ganganagar, India) **Semi-technique in ESP tests with non-familiar mother-child groups.** *Shiksha*, 1962, 15(2), 83-87.—20 Ss were given 200 runs of cards. Results claim that the Ss secured the knowledge of targets clairvoyantly. 75% of the Ss scored with positive deviation, 10% at chance level, and 15% scored below MCE. 35% of the Ss scored very significantly. Implications for parapsychological work are discussed.—*U. Pareek.*

7522. Girden, E. (Brooklyn Coll.) **A postscript to "A Review of Psychokinesis (PK)."** *Psychol. Bull.*, 1962, 59(6), 529-531.—Many of the criticisms leveled by Murphy (see 37: 7524) on an earlier paper by Girden (see 37: 6052) are considered. It is concluded that the existence of PK has not been proven.—*W. J. Meyer.*

7523. Gudas, Fabian. (Ed.) (Louisiana State U.) **Extrasensory perception.** New York: Scribner, 1961. xv, 141 p. \$1.95(paper).—An anthology of 25 papers reflecting the thought and/or research on extrasensory perception from the 17th to the 20th century. Selections include articles by Increase Mather, Francis Bacon, Michael Faraday, Mark Twain, William James, B. F. Skinner, J. B. Rhine, S. G. Soal, and Edwin G. Boring.—*J. B. Thompson.*

7524. Murphy, Gardner. (Menninger Found., Topeka, Kan.) **Report on paper by Edward Girden on psychokinesis.** *Psychol. Bull.*, 1962, 59(6), 520-528.—Failure to replicate, as Girden has suggested, does not mean a particular event was never there or is necessarily an artifact. This and several other issues raised by Girden (see 37: 6052) are considered unreasonable. Alternative arguments are offered.—*W. J. Meyer.*

7525. Prasad, Jamuna. (Bureau Psychology, Allahabad, India) **Need and scope for research in parapsychology.** *Shiksha*, 1963, 15(3), 130-132.—It has to be found out whether psychic experience is an extension of the psychological effort of need ful-

filament and tension reduction. The phenomena of rebirth and yogic experience in India need thorough research.—*U. Pareek.*

7526. Rhine, J. A. **Parapsychology.** *Shiksha*, 1962, 15(2), 69-82.—A short sketch of the field of parapsychological studies—extrasensory perception and psychokinetics. The psychology of psi is also discussed.—*U. Pareek.*

7527. Schmeidler, Gertrude R. (City Coll. New York) **Note on precognition with and without knowledge of results.** *Psychol. Rep.*, 1962, 11(2), 486.—50 students guessed at targets to be generated and scored later by a computer. 34 Ss, rescored because of programing and machine errors, failed to score significantly above chance; but 16 Ss scored only once were above chance.—*B. J. House.*

ENVIRONMENTAL EFFECTS

SLEEP & FATIGUE

MOTIVATION & EMOTION

7528. Lee, Joan C., & Griffith, Richard M. (Kentucky State Hosp., Danville) **Time error in the judgment of humor.** *Psychol. Rep.*, 1962, 11(2), 410.—Of cartoons presented in pairs to 29 Ss, the 2nd of each pair was more often judged funnier than the 1st. Results are related to Berlyne's theory of humor.—*B. J. House.*

7529. Meade, Robert D. (Trinity Coll.) **Effect of motivation and progress on the estimation of longer time intervals.** *J. exp. Psychol.*, 1963, 65(6), 564-567.—Earlier experiments on short time periods have shown time estimates to be inversely related to rate of progress through a task when there is motivation to reach a goal. This study tested the effects of these variables for 15-, 30-, 45-, and 60-min. periods. A factorial design with 2 rates of progress and 2 levels of motivation was used with 10 Ss under each of the 4 conditions. The experimental task was a stylus maze. The conclusion is that Ss' time estimates are inversely related to rate of progress under high motivation but unrelated under low motivation for all periods except 45 min. where the results fell just short of significance at the .05 level of confidence.—*Journal abstract.*

7530. Plutchik, Robert. (Hoifstra Coll.) **The emotions: Facts, theories and a new model.** New York: Random House, 1962. viii, 204 p. \$1.95.—After briefly discussing what is a theory of emotion and what are its general problems, the following theories are reviewed: James-Lange, attitude, Cannon-Bard, activation, motivational, psychoanalytic, and behavioristic. The author presents his theory which distinguishes primary emotions and their mixtures, analogous to primary colors in complementary pairs. The prototype patterns of behavior described are identifiable at many different phylogenetic levels. A multidimensional model and some relevant experimental studies are presented.—*R. S. Davidson.*

7531. Shantz, D. W., Rubin, B. M., & Smock, C. D. (Purdue U.) **Utilization of visual information as a function of incentive motivation.** *Percept. mot. Skills*, 1962, 15(2), 357-358.—Responses of 92 Ss to projection slides depicting 3 levels of figure complexity showed that incentive motivation produced greater accuracy for all complexities and more brief

discussion times. Interpretation in terms of cues and attention is mentioned.—*W. H. Guertin.*

7532. Zas, Yaakov. **Hatsehok mahu?** [What is laughter?] Tel Aviv, Israel: Yavneh, 1962. 136 p.—The nature and forms of laughter are described on the basis of the author's (a physician) observations and illustrated by quotations from some philosophers' writings. The main items discussed are: physiology of laughter, psychology of laughter, laughing and playing, tears of laughter, the basis of being ridiculous, comical things, and folk jokes.—*H. Ormian.*

PSYCHOMOTOR TASKS

7533. Ammons, C. H., & Ammons, R. B. (Montana State U.) **Motor skills bibliography: XXXI.** *Psychological Abstracts*, 1957, Volume 31, Second Half. *Percept. mot. Skills*, 1962, 15(2), 555-558.—A continuing, unannotated bibliography appearing irregularly in this journal.—*W. H. Guertin.*

7534. Arana, L., & Sokolov, E. N. (Moscow U. USSR) **Stockhicheskaia teoriia vospriiatiia: Soobshchenie VII. Osobennosti sokrashcheniia osiazatel'nogo vospriiatiia bukvennykh izobrazhenii.** [Stochastic theory of perception: Communication VII. Reduction of tactile perception of letter patterns.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1962, No. 3 77-81.—5 Ss were required to identify by touch the patterns of alphabet letters presented in a 5 × 5 square using the minimum amount of cells. The schemes used by Ss were different from those employed when working under instructions of speed. The step-by-step verbal report by Ss slowed down the time but improved the quality of the search.—*A. Cuk.*

7535. Bertelson, Paul. (U. Libre Bruxelles) **S-R relationships and reaction times to new versus repeated signals in a serial task.** *J. exp. Psychol.*, 1963, 65(5), 478-484.—Previous experiments showed that, in a serial responding task, RTs to repeated signals are longer than RTs to new signals. The influence of S-R relationships on this phenomenon was examined. In Experiment I, 9 Ss gave 550 responses under each of 3 S-R conditions in a 2-choice task with a spatial display. RTs to both repeated and new signals were significantly (.01) affected by the conditions, but covariance analysis shows that the effect is significantly (.05) larger on RTs to new signals. These results are fully confirmed by Experiment II where 33 Ss, after prolonged practice on a 4-choice task with a numerical display, under a straightforward S-R pairing, did 4 short runs of 50 responses under the same pairing and then under a less compatible one.—*Journal abstract.*

7536. Borger, Robert. (Brunel Coll.) **The refractory period and serial choice-reactions.** *Quart. J. exp. Psychol.*, 1963, 15(1), 1-12.—An experiment is described in which Ss had to make consecutive 2-choice reactions to light and sound stimuli, the interval between signals being fixed for any one series of presentations. When under these conditions, reaction times to the 2nd signal are compared to those obtained when the 1st signal is used only as a warning, delays are found for short intervals. These results and the wide individual differences obtained are discussed in relation to theories that have been put forward to account for the delays obtained in serial reaction tasks.—*Journal abstract.*

7537. Clément, F. (Cent. Gérontologie Claude Bernard, Paris, France) **Modifications du temps de réaction simple en fonction de l'âge et de quelques autres facteurs.** [Modifications of simple reaction time as a function of age and some other factors.] *Rev. Psychol. appl.*, 1962, 12(3), 163-188.—750 Ss, ranging in age from 16 to 100 yr., pressed a lever in response to a light signal. Reaction time was found to: (a) be significantly slower as age increased, and more variable; (b) correlate +.25 with IQ; and (c) be slower for women than men. (49 ref.)—E. Y. Borrowman.

7538. Hellyer, Sidney. (Defense Research Medical Lab., Toronto, Canada) **Stimulus-response coding and amount of information as determinants of reaction time.** *J. exp. Psychol.*, 1963, 65(5), 521-522.—Earlier investigators have shown reaction time and stimulus information to be linearly related with a slope dependent upon amount of pre-experimental practice. 5 housewives were run on 3 tasks varying in pre-experimental practice; light-naming, reading names from slides, and number-naming. Amount of information was varied from 1 to 3 bits. The results confirmed the linear relationship with the slope a decreasing function of pre-experimental practice. However, even after 5040 trials on the task with the least such practice, light-naming, differences in reaction time corresponding to differences in information amount had decreased but little, indicating that the information effect is stable, at least for relatively unusual tasks.—*Journal abstract.*

7539. Krinchik, E. P. (Moscow U., USSR) **Izuchenie protsessy pererabotki informatsii chelovekom v situatsii vybora: Soobshchenie III. Zavisimost' vremeni reaktsii vybora ot velichiny spetsificheskoi i srednei informatsii.** [Information processing by man in a choice situation: Communication III. Choice reaction time as a function of the amount of specific and average information.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1962, No. 3, 71-76.—Statistical analysis of data obtained previously leads to the following conclusion: the smaller the probability of the signal the greater is the deviation of the obtained RT from the expected one. An attempt is made to explain this effect psychologically in terms of the perceptual structure.—A. Cuk.

7540. Nance, R. D. (U. Wisconsin) **Transfer using unpaced and paced pursuit rotor practice.** *Psychol. Rec.*, 1962, 12, 345-349.—"Fifty-four Ss, 11 men and 43 women, were given 30 distributed trials on the pursuit rotor. All Ss were given both paced and unpaced trials, half having paced work first, the other half having unpaced work first. The problem was the determination of the possible transfer effect from one kind of work to the other. The investigator concluded that both positive and negative transfer probably occurred."—R. J. Seidel.

7541. Smith, L. E. (U. California) **Influence of neuromotor program alteration on the speed of a standard arm movement.** *Percept. mot. Skills*, 1962, 15(2), 327-330.—The maximal speed of a lateral adductive arm movement was measured in 60 male college students under varying conditions. Results support the doctrine of extreme specificity of individual differences in movement ability. They also support the current movement theory that ascribes

individual differences in maximal speed to differences in the CNS or neural program that controls the detailed muscular actions.—W. H. Guertin.

7542. Thomas, Aley, & Solley, Charles M. (Wayne State U.) **Search-discrimination time for missing stimulus information.** *J. exp. Psychol.*, 1963, 65(5), 501-506.—2 experiments in search discrimination were conducted. In both, 6th grade children had to search for a missing stimulus target which would complete the set. Targets were defined by either single classifications—color, form, or size; double classifications—color-form, color-size, or form-size; and triple classifications—color-form-size characteristics. The number of stimuli in the search field was either 8, 17, 35, or 53. It was found that search-discrimination time increased linearly with the number of stimuli; that single- and triple-classified stimuli were easier than double-classified ones; and that practice facilitated search discrimination, particularly for double-classified stimuli.—*Journal abstract.*

ATTENTION & SET

7543. Allen, Charles K., Hill, Frances A., & Wickens, Delos D. (Ohio State U.) **The orienting reflex as a function of the interstimulus interval of compound stimuli.** *J. exp. Psychol.*, 1963, 65(3), 309-316.—The experiment investigated the orienting response as a function of temporal relations among the stimuli, with GSR the measure. 3 stimuli were employed. The duration of the 1st was 1300, 1050, or 750 msec., with 2 groups at each interval. The duration of the 2nd and 3rd were 600 and 100 msec., respectively. They terminated together and consisted of a tone and 2 different lights. Following 10 presentations of the compound, separate groups were tested to the 1st or 2nd stimulus alone. The shift from triple stimulation to single produced a significant increase in GSR magnitude and also a significant interaction between order and original precedence time.—*Journal abstract.*

7544. Deutsch, J. A., & Deutsch, D. (Stanford U.) **Attention: Some theoretical considerations.** *Psychol. Rev.*, 1963, 70(1), 51-61.—The selection of wanted and unwanted messages requires discriminatory mechanisms of as great a complexity as those in normal perception, as is indicated by behavioral evidence. The results of neurophysiology experiments on selective attention are compatible with this supposition. This presents a difficulty for Filter theory. Another mechanism is proposed, which assumes the existence of a shifting reference standard, which takes up the level of the most important arriving signal. The way such importance is determined in the system is further described. Neurophysiological evidence relative to this postulation is discussed. (62 ref.)—*Journal abstract.*

7545. Gardner, Riley W., & Long, Robert I. (Menninger Found.) **Cognitive controls of attention and inhibition: A study of individual consistencies.** *Brit. J. Psychol.*, 1962, 53(4), 381-388.—Results of a previous study (Gardner, 1961) suggested that independent principles of cognitive control are involved in (a) extensiveness and (b) selectiveness of attention deployment. The present study extends these results by demonstrating that differential predictions can be made even when criterion scores for the 2 control principles are obtained from a single

set of judgements. It is also shown that individual differences in selective attention can be observed whether compelling irrelevant stimuli enclose, are enclosed by, or are interpolated among relevant stimuli, and that 2 forms of inhibition—extensiveness of scanning and inhibition of irrelevant motoric responses—may be associated. (21 ref.)—*Journal abstract*.

7546. McCormack, P. D. (U. Manitoba, Canada) **A 2-factor theory of vigilance.** *Brit. J. Psychol.*, 1962, 53(4), 357-363.—The findings of 7 studies on reaction time are related to those of the more conventional vigilance setting, discussed with respect to existing theories of vigilance and integrated within an inhibition-motivation framework. (20 ref.)—*Journal abstract*.

7547. Osborn, William C., Sheldon, Richard W., & Baker, Robert A. (USA Armor Human Research Unit, Fort Knox, Ky.) **Vigilance performance under conditions of redundant and nonredundant signal presentation.** *J. appl. Psychol.*, 1963, 47(2), 130-134.—Brief interruptions in a sound, a light, or both the sound and light, were monitored by 41 Ss over a 3-hour period. A dual response apparatus allowed the Ss to report the light signals, the sound signals, or both. The detection rate was found to be significantly better for the redundant signals than for either alone. While the detectability of each component of the redundant signal was comparable to its corresponding single mode, a systematic deviation in the bimodal curve—from predicted to observed—was noted. It was concluded that the weaker component of a redundant signal contributes significantly to the overall detectability, and the use of dual channel displays in applied vigilance situations is justified.—*Journal abstract*.

7548. Schmidt, Marianne W., & Kristofferson, Alfred B. (U. Cincinnati, Ohio) **Discrimination of successiveness: A test of a model of attention.** *Science*, 1963, 139(Whole No. 3550), 112-113.—Interpreting attention as a periodic phenomenon, we show its relevance to discriminating the successiveness of signals presented to separate sense modalities. Experiments confirm the expected linear relation between the probability of discriminating pairs of successive from pairs of simultaneous signals and make it possible to infer the period of attention.—*Journal abstract*.

LEARNING

7549. Agnew, Neil, & Agnew, Mary. (U. Saskatchewan) **Drive level effects on tasks of narrow and broad attention.** *Quart. J. exp. Psychol.*, 1963, 15(1), 58-62.—Easterbrook (1959) has predicted that: (a) performance on tasks involving the use of a wide range of cues will be impaired under high-drive conditions and that (b) performance on tasks requiring the use of only a narrow range of cues will be facilitated under such conditions. Using the Porteus Maze Test, relatively clear evidence was obtained to support the 1st prediction. Using the Stroop Colour Word Interference Test some evidence was obtained in support of the 2nd prediction. (17 ref.)—*Journal abstract*.

7550. Blick, Kenneth A., & Bilodeau, Edward A. (Tulane U.) **Interpolated activity and the learning of a simple skill.** *J. exp. Psychol.*, 1963, 65(5),

515-519.—2 experiments compared the effects of interpolated activity (R_b) on the acquisition of a simple arc-drawing response (R_a). The sequence of events was R_a -KR, R_b , R_a -KR, R_b , etc. For 1 group of Experiment I, R_b was identical to R_a , for 3 groups R_b was quantitatively similar, and for a final group R_b was opposite in direction. In Experiment II a rest-control group was used to evaluate the direction (sign) of transfer. The results indicated that the learning of R_a was not differentially affected by the similarity of R_b . The interpolated activity was also found to have no negative or positive transfer effects on the acquisition of R_a . The findings were related to several other null-producing procedures and their relevance to the Osgood Surface was discussed.—*Journal abstract*.

7551. Cratty, Bryant J. (U. California, Los Angeles) **Characteristics of human learning in an irregular-planned locomotor maze.** *Calif. J. educ. Res.*, 1963, 14(1), 36-42.—This is an informal recapitulation of a number of studies, by the author, of the behavior of college male volunteers in a physical education program in learning to "run" a 112-ft. plastic tubing, waist-high maze with an irregular pattern and no cul-de-sac. Observations are made in terms of learning rate, performance variability, use of sensory cues, knowledge of results, whole-part learning, and motivation.—T. E. Newland.

7552. Cratty, Bryant J. (U. California, Los Angeles) **Recency versus primacy in a complex gross motor task.** *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Rec.*, 1963, 34(1), 3-8.—2 groups of male university students were given 10 spaced trials to learn a large locomotor maze. The Ss were blindfolded, and learning criterion was traversal time. First learned, based upon traversal speed, was the initial $\frac{1}{2}$ of the pattern; last to be learned was the 2nd $\frac{1}{2}$. Following the 4th trial, differences between 1st and 2nd $\frac{1}{2}$ traversals times exceeded the .01 level of significance. The recency-primacy phenomena seemed independent of the complexity of the pathway, as the 1st $\frac{1}{2}$ speed was always faster, regardless of the direction maze traversal occurred. (16 ref.)—*Journal abstract*.

7553. Ebenholtz, Sheldon M. (Connecticut Coll.) **Position mediated transfer between serial learning and a spatial discrimination task.** *J. exp. Psychol.*, 1963, 65(6), 603-608.—In a position learning task (PL) Ss learned to discriminate between 10 spatial locations arranged in a vertical array, by associating a nonsense syllable with each position. Transfer from serial learning (SL) to PL and from PL to SL was studied. In Condition C the temporal order of syllables in SL (i.e., from beginning to end) corresponded with the spatial location of the same syllables in PL (i.e., from top to bottom). The relative positions of the syllables was random in Condition D. In Condition R the relative syllable positions were displaced, however adjacent items in SL were at contiguous locations in PL. Transfer in both directions was highest in the 1st condition. With one exception, the results of Conditions D and R did not differ from each other. Results yield evidence for position learning in SL and raise the question of the role of sequential association.—*Journal abstract*.

7554. Eysenck, H. J., & Willett, R. A. (Inst. Psychiatry, U. London, England) **Performance and**

reminiscence on a symbol substitution task as a function of drive. *Percept. mot. Skills*, 1962, 15(2), 389-390.—High-drive and low-drive Ss were not differentiated in their performance on a symbol substitution task but were found to differ very significantly in their reminiscence scores. Low-drive Ss, counter to prediction, had higher reminiscence scores than high-drive Ss.—*W. H. Guertin*.

7555. Gollin, E. S. (Queens Coll.) Embedded figures, learning, and recall: A note on Long's paper. *Percept. mot. Skills*, 1962, 15(2), 326.—Long (see 37: 4375) attributes relationships between an embedded figures test and original learning and retention on another test to a common factor, Field-Articulation (FA). This author proposes that modifying the association value of words in the original learning task would demonstrate the value of FA as an explanatory principle.—*W. H. Guertin*.

7556. Kinkade, Robert G. (Ohio State U.) A differential influence of augmented feedback on learning and on performance. *USAF AMRL tech. docum. Rep.*, 1963, No. 63-12. iv, 10 p.—A test was conducted of the hypothesis that the training value of augmented feedback in a tracking situation will depend upon the discernibility of input and fundamental feedback signals. Ss performed a 1-dimensional compensatory tracking task using a knob for positional control over the cursor. For 2 of 4 groups of Ss the reference element was noisy, oscillating at random about a null position, while for the other 2 it was not. Augmented feedback, in the form of auditory clicks at the rate of 2 per sec. when on target, was given one of each pair of groups during training. On subsequent tests the performance of the group trained with augmented feedback and performing with the noisy display deteriorated to the level of its control group trained without feedback. But, the performance of the group trained with augmented feedback and performing on the noise-free display continued unchanged and superior to that of its control group trained without feedback. The results are regarded as confirming the hypothesis and as helping to explain previous contradictory findings on the value of augmented feedback. (15 ref.)—*USAF AMRL*.

7557. Maeda, S. (Osaka U., Japan) [An experimental test of g_{IR} in motor learning.] *Jap. J. Psychol.*, 1962, 33(3), 141-149.—Students were requested to write alphabet letters upside down under 2 conditions of pretest training (distributed or massed). In addition, either massed or distributed practice was given following the experimental session, after the formal rest period. Results indicated that distributed practice was superior using the work-limited method in pretest training, that massed practice yielded considerable reminiscence while distributed practice did not, and that analysis of posttest performance did not demonstrate g_{IR} .—*A. Barclay*.

7558. Manning, W. H., & Du Bois, P. H. (Texas Christian U.) Correlational methods in research on human learning. *Percept. mot. Skills*, 1962, 15(2), 287-321.—Frequently reported low correlation between change in learned proficiency and aptitude measures should be reinterpreted in the light of logical and empirical inadequacies of the crude difference criterion of change. Residual change measures, because they fit into correlational pro-

cedures and are correspondingly metric free, offer promise for the study of the correlates of gain in training and educational situations. The use of residual gain as a criterion for the validation of selection tests would serve to facilitate selection procedures oriented toward criteria of trainability or educability, rather than to achievement at a particular point in learning.—*W. H. Guertin*.

7559. Mukherjee, Bishwa N. (U. North Carolina) Transfer of two-hand coordination skill as a function of initial ability level. *J. gen. Psychol.*, 1962, 67(2), 215-223.—In a study of transfer of training from the simple to the complex part of a modified 2-hand coordination test the following hypotheses were: (a) there would be positive transfer from the simple to the complex part at all levels of initial ability, (b) the amount of transfer would vary systematically with variation in the group's initial performance on the 2-hand test, and (c) the amount of transfer for different groups would be more highly related to the group's initial ability level than the scores received on the simple part at the final phase of practice. Following the usual paradigm of transfer experiments, the experimental groups received 100 practice trials on the simple part which the control groups did not get. Then both the experimental and control group practiced for 100 trials on the complex part, 20 trials every day for 5 sessions. The results on the whole confirmed all 3 hypotheses formulated.—*Author abstract*.

7560. Naylor, James C., & Briggs, George E. (Ohio State U.) Effects of task complexity and task organization on the relative efficiency of part and whole training methods. *J. exp. Psychol.*, 1963, 65(3), 217-224.—Task complexity (2 levels), task organization (independence of task dimensions—2 levels), and training method (whole vs. progressive-part) were combined factorially in an 8-group transfer of training study of skill in a Markov prediction task. A hypothesized interaction of the 3 independent variables was supported by the data, thus suggesting the following training principle: for a relatively highly organized (integrated) task, a whole-task training method should be superior to a part schedule at all levels of task complexity; however, for a relatively unorganized task (all task dimensions independent), an increase in task complexity will result in a part-task training schedule becoming superior to whole training.—*Journal abstract*.

7561. Rosenberg, S. (Training School, Vineland, N. J.) The influence of intentional learning on incidental learning. *J. gen. Psychol.*, 1962, 67(2), 181.—This study attempted to evaluate the possibility that in the incidental learning design in which Ss are exposed to 2 classes of items, instructed to learn 1, but tested for retention of both, incidental learning is a function of generalization of learning instructions from the intentional task. 2 groups of Ss received a 1-trial presentation of 12 pictures of common objects, each of which was accompanied by a different 2-digit number. 1 group was instructed to learn the names of the objects, while the other was told only to observe a series of common objects, with no mention made of the numbers in either group. Results indicated that instructions to learn the object names significantly facilitated their retention, but had no effect upon retention of the numbers. Results were in-

terpreted as suggesting that incidental learning was not the result of generalization of learning instructions from the intentional task.—S. Rosenberg.

Conditioning

7562. Aiba, T. S. (U. London, England) **Can the absolute threshold be conditioned?** *J. exp. Psychol.*, 1963, 65(3), 233-239.—Earlier studies have suggested that the absolute threshold to light can be raised by certain irrelevant stimuli, such as a tone, that had previously been presented many times in the presence of adapting lights. An attempt was made to confirm this finding. 2 groups took part, each consisting of 6 Ss. The 1st group received a combination of a tone and a moderately bright light, the 2nd a tone and a weak red light. Later, the threshold was measured in the presence of the tone alone. Of the 2 groups, the 1st gave consistently higher thresholds. The effect is not attributable to adaptation. It is concluded that at least the possibility of the conditioning of the absolute threshold exists.—*Journal abstract.*

7563. Ekman, Paul; Krasner, Leonard, & Ullmann, Leonard P. (Stanford U.) **Interaction of set and awareness as determinants of response to verbal conditioning.** *J. abnorm. soc. Psychol.*, 1963, 66(4), 387-389.—The utility of an operant conditioning model to psychotherapy was evaluated by studying the definition of the situation given S and S's focus on E's behavior. Instructions induced either a positive or negative set, identifying a story telling task as a test of empathy or personal problems. Awareness was induced in $\frac{1}{2}$ of the Ss by calling attention to E's reinforcement "mm-hmm." 12 undergraduate students served as Ss in each of the 4 experimental groups. Positive set-Aware Ss increased use of emotional words, while Negative set-Aware Ss decreased use of emotional words. The results were interpreted as evidence that awareness can either facilitate or inhibit conditioning, depending upon S's set. (26 ref.)—*Journal abstract.*

7564. Grice, G. Robert; Simmons, Howard J., & Hunter, John J. (U. Illinois) **Failures to obtain mediated generalization effects in eyelid conditioning.** *J. exp. Psychol.*, 1963, 65(5), 485-489.—4 experiments employing differential conditioning of the eyelid response were conducted to investigate the phenomenon of mediated generalization. The intended mediating responses were instructed manual or verbal reactions. 3 of the experiments involved implicit representation of these responses initiated by the onset of the CS. In the 4th experiment the mediating response occurred just prior to the CS in order that the response-produced cues might form a favorable conditioning interval with the UCS. None of the experiments provided evidence for the operation of mediational effects. Experiments of this kind have yielded positive evidence only when the mediating response was overt and in close temporal proximity to the mediated response elicited.—*Journal abstract.*

7565. Haas, Kurt. (Bowling Green State U.) **Verbal conditioning of affective responses.** *J. gen. Psychol.*, 1962, 67(2), 319-322.—The possibility of employing verbal conditioning techniques to produce changes in affective verbal behavior was investigated. It was demonstrated, by variously reinforcing 3

groups of 30 Ss each, that an increase in the mean frequency of emotionally positive and emotionally negative endings to spoken incomplete sentences could be brought about by verbally reinforcing their occurrence. It was suggested that therapists might be inducing similar conditioned changes in the patient's verbal report, during the course of counseling, by concentrating on particular type of responses and differentially reinforcing their occurrence.—*Author abstract.*

7566. Hartman, Thomas F. (U. Wisconsin) **Semantic transfer of the differential conditioned eyelid response from words to objects.** *J. exp. Psychol.*, 1963, 65(2), 194-200.—This experiment investigated transfer of the eyelid CR from words to objects possessing characteristics of the words and evaluated the effects of concurrently verbalizing specific characteristics of the objects. 120 Ss were used. Findings were (a) marked discrimination early in the transfer phase even when the words initially differentially reinforced were unrelated to the objects; (b) more initial CR transfer to the positive object CS for 2 groups with initially relevant words—one group verbalizing a dimension of the objects identical to the words, the other group verbalizing another relevant dimension of the objects; (c) more initial transfer of discrimination only for the group verbalizing the dimension of the objects identical to the word CSs. (16 ref.)—*Journal abstract.*

7567. Kimmel, Ellen, & Kimmel, H. D. (U. Florida) **A replication of operant conditioning of the GSR.** *J. exp. Psychol.*, 1963, 65(2), 212-213.—An earlier study of operant conditioning of the GSR was replicated. 2 groups of 15 Ss were run in a totally dark room. After a 10-min. rest, the Contingent (C) group received a dim light following unelicited GSRs for 16 min., then 10 min. of extinction. The Noncontingent (N) group received the same number of lights per min. during reinforcement, when no GSRs were occurring. The dependent variable was the percentage of responses per min., using the average of the last 5 min. of rest as a baseline. Group C emitted significantly more responses during reinforcement and extinction than Group N ($p < .01$). The groups converged during extinction ($p < .05$). It was concluded that the unelicited GSR can be conditioned instrumentally.—*Journal abstract.*

7568. Kimmel, H. D., & Pennypacker, H. S. (U. Florida) **Differential GSR conditioning as a function of the CS-UCS interval.** *J. exp. Psychol.*, 1963, 65(6), 559-563.—Differential GSR conditioning at 4 CS-UCS intervals, $\frac{1}{4}$, $\frac{1}{2}$, 1, and 2 sec., was studied with 16 Ss in each condition. 16 reinforcements of CS+ and nonreinforcements of CS- were given, the CSs being 40-db. tones of 800 or 1000 cps. The UCS was an electric shock. Nonreinforced trials on CS+ were given after 4, 8, and 16 reinforcements. Differential conditioning increased as a function of the CS-UCS interval. The advantage of the 2-sec. condition was due in part to the low response to CS-. Later in conditioning the GSR to CS+ reduced in the 2-sec. condition but not in the others. These results were attributed to the more rapid growth of inhibition in the longer CS-UCS intervals.—*Journal abstract.*

7569. Lang, Peter J., Geer, James, & Hnatiow, Michael. (U. Pittsburgh) **Semantic generalization of conditioned autonomic responses.** *J. exp.*

Psychol., 1963, 65(6), 552-558.—Ss were presented with a series of verbal stimuli some of which were followed by electric shock. Subsequently they were administered unreinforced verbal stimuli, distributed along a scaled meaning dimension extending from words similar to those shocked to neutral words. Responses in 3 autonomic systems were monitored (finger plethysmograph, heart rate, and GSR). Generalized responses were found to words very similar in meaning to the training stimuli. Response amplitude fell off sharply with the presentation of less closely related words.—*Journal abstract.*

7570. Martin, Irene. (U. London, England) GSR conditioning and pseudoconditioning. *Brit. J. Psychol.*, 1962, 53(4), 365-371.—Ss were placed into conditioning or pseudoconditioning groups, and received 1, 3, or 5 UCS trials (paired with CS or single). The sequence of the schedule was: 10 light stimuli—tones (the UCS)—10 light stimuli. Significantly more GSR's were given to the final light series than to the first. Conditioning groups together gave significantly more responses than pseudoconditioning groups during the final lights. However, the effect of different numbers of UCS trials was more clear-cut between pseudoconditioning groups. Basal skin resistance was significantly lower in all groups following the tones. There was no difference between conditioning and pseudoconditioning groups in this measure. Number of GSR's and basal skin resistance were not significantly correlated in the 1st light series, but were highly (negatively) so in the final light series. Autonomic Liability Scores to tone 1 correlated significantly with number of GSR's to both light series only in the conditioning groups. This effect was interpreted as a generalized responsiveness of these groups plus a small facilitatory effect from the extent of the S's response to the tones. The results are discussed from 2 points of view: (a) physiological, and considering how various CNS levels might affect GSR amplitude and threshold via excitability of spinal internuncial neurones, and (b) within behavioral theories of learning, and considering the effect of the UCS upon level of "drive." (15 ref.)—*Journal abstract.*

7571. Moore, John W., & Gormezano, Isidore. (Indiana U.) Effects of omitted versus delayed UCS on classical eyelid conditioning under partial reinforcement. *J. exp. Psychol.*, 1963, 65(3), 248-257.—The comparative effects in eyelid conditioning of 2 partial reinforcement techniques of UCS omission and UCS delay was investigated under 3 partial reinforcement schedules of 25, 50, and 75%. Under both procedures reinforced trials consisted of presentation of the UCS at a CS-UCS interval of 500 msec. It was found that: (a) UCS omission resulted in higher levels of conditioning and greater resistance to extinction than UCS delay; (b) shorter CR latencies were obtained under UCS omission than UCS delay; and (c) acquisition performance increased directly with percentage reinforcement, but reinforcement schedule failed to produce systematic effects on extinction. An associative and nonassociative interpretation was offered for the decremental effects of the UCS-delay procedure. (15 ref.)—*Journal abstract.*

7572. Passey, George E., & Burns, Thomas C. (U. Alabama) Influence of variable reinforcement upon acquisition of the conditioned eyelid re-

sponse. *Psychol. Rep.*, 1962, 11(2), 547-552.—6 groups of students (N = 65) received 50 eyelid conditioning trials followed by 15 extinction trials for $\frac{1}{2}$ the Ss in each group. $\frac{1}{2}$ the groups were trained with mean UCS (air puff) intensity of 5.5 lb. per square in. and $\frac{1}{2}$ with a mean of 8.0 lb. per square in. Under each intensity value, 1 group (C) was always stimulated at the mean UCS intensity, while intensity varied randomly with a standard deviation of 1.9 lb. per square in. for 1 group (HV) and 0.9 lb. per square in. for the other (LV). Number of anticipatory responses during acquisition increased with higher mean UCS intensity, and decreased with greater variability of intensity. Resistance to extinction was not affected.—*B. J. House.*

7573. Rickard, Henry C., & Dinoff, Michael. (U. Alabama) A follow-up note on "Verbal Manipulation in a Psychotherapeutic Relationship." *Psychol. Rep.*, 1962, 11(2), 506.—(See 37: 3370) A 62-year-old male psychiatric patient was retested 2 years after a verbal conditioning experiment in which rational speech was increased by social reinforcement. No performance loss was observed over the 2-year interval.—*B. J. House.*

7574. Runquist, Willard N. (Pomona Coll.) Performance in eyelid conditioning following changes in reinforcement schedule. *J. exp. Psychol.*, 1963, 65(6), 617-618.—4 groups of 16 Ss were run in a classical eyelid conditioning experiment. 2 groups received 76 trials under a random 50% reinforcement schedule, 1 group with a 50-mm. airpuff as the UCS and the other group with a 100-mm. airpuff as the UCS. The other 2 groups received 60 trials of 100% reinforcement followed by 16 trials of 50% reinforcement. The same 2 UCS intensities were used in these 2 groups. Acquisition data showed little effect of UCS intensity although partial reinforcement resulted in lower performance. Following the shift, performance dropped in the continuously reinforced groups, and there was little evidence of any overall difference in postshift performance. A further analysis of the trials following nonreinforcement suggested that nonreinforcement produced more inhibition when the UCS was stronger.—*Journal abstract.*

7575. Simkins, Lawrence. (Florida State U.) Instructions as discriminative stimuli in verbal conditioning and awareness. *J. abnorm. soc. Psychol.*, 1963, 66(3), 213-219.—This investigation was to study the effects of preconditioning instructions and type of reinforcer on level of awareness and extent of conditioning. Prior to a conditioning task, Ss in different experimental groups were given varying degrees of information concerning the nature of the reinforcement and the reinforcement contingency. In some groups of Ss the reinforcement consisted of E saying "good" while in other experimental groups the Ss received points as reinforcement. The results indicated that the degree of conditioning and level of awareness were partially dependent upon the amount of information in the preconditioning instruction. However, in experimental groups where only partial information was given, Ss who received points conditioned better than Ss who received "good" even though there were no differences in the level of awareness. The nature of the response class was also found to be an important variable that affected the level of conditioning.—*Journal abstract.*

7576. Spielberger, Charles D., & DeNike, L. Douglas. (Duke U.) Operant conditioning of plural nouns: A failure to replicate the Green-spoon effect. *Psychol. Rep.*, 1962, 11(2), 355-366.—Ss instructed to say words were reinforced after plural nouns by E's saying "mmm-hmm." An intensive interview conducted immediately after the 15-min. conditioning period revealed 2 partially aware Ss. "Comparison of the rate of emission of plural nouns for 20 unaware Ss who received reinforcement with 10 nonreinforced controls, carefully matched for initial operant rate, revealed no significant differences between these groups. The possibility that findings of 'learning without awareness' in other investigations of verbal conditioning might be artifacts of the failure to detect awareness of response-reinforcement contingencies in some subjects, and/or inadequate control for operant rate, was discussed."—B. J. House.

7577. Ulrich, R. E. (Wesleyan U.) Conversation control. *Psychol. Rec.*, 1962, 12, 327-330.—As a test of the hypothesis that verbal conditioning is more a reflection of E's expectations than S's verbal behavior, student Es were instructed to say "uh-huh" (agreement) or "huh-uh" (disagreement) following statements of opinion for 3 10-min. periods. In 5 classes of Es only 12-30% completed the experiment. Mean number of opinion statements remained constant despite changes in the verbal reinforcer.—R. J. Seidel.

7578. Wickens, Delos D., & Cross, Henry A. (Ohio State U.) Resistance to extinction as a function of temporal relations during sensory preconditioning. *J. exp. Psychol.*, 1963, 65(2), 206-211.—This experiment investigated the effect of inter-stimulus interval within the range of 0 to 600 msec. in sensory preconditioning. The basic design was: 10 preconditioning trials to light and tone; GSR conditioning to light with shock UCS for 10 trials; 4 tests to tone. 4 groups of 20 Ss were used in different tone-light interstimulus intervals during preconditioning. The interval differences were 0, 100, 400, and 600 msec., tone preceding light. The groups differed significantly in response strength during the tests to the tone, with order of response magnitude from lowest to highest being 600, 0, 100, and 400; an order similar to that found in interstimulus interval-curves in ordinary conditioning and in elements of a compound CS.—*Journal abstract.*

Discrimination

7579. Cameron, Donald B. Post-discrimination gradients around stimuli with differential rates of occurrence in a discrete response task. *USAF ESD tech. docum. Rep.*, 1962, No. 62-352. iii, 25 p.—Generalization gradients in an identification type task reflect the willingness to apply identifying labels to stimuli which deviate from what might be called the "ideal standard" of a class. After training Ss to discriminate between pairs of ideal standards varied in both discriminability and frequency of occurrence, it is shown that postdiscrimination generalization gradients are characterized by a redistribution of identifying responses around the more frequent standard as a function of discriminability.—*USAF ESD.*

7580. Simon, S. H. (VA Hosp., Tomah, Wis.) Effect of a relevant observation stimulus on human discrimination learning as a function of posi-

tion of the relevant stimulus. *Percept. mot. Skills*, 1962, 15(2), 359-365.—54 Ss were given 32 trials on a discrimination problem involving 1 relevant and 2 irrelevant stimulus dimensions with 2 levels to each dimension. All 3 dimensions were represented on each trial, varying between their 2 levels from trial to trial but maintaining their relative positions. Ss were divided into 3 groups with the relevant dimension being in a different position for each group. In addition, $\frac{1}{2}$ of each group had a dot over the relevant dimension. Results showed that the dot did significantly facilitate learning, with the difference between groups being most evident when the relevant dimension was in the middle position.—W. H. Guertin.

Verbal Learning

7581. Battig, William F., & Brackett, H. Ray. (U. Virginia) Transfer from verbal-discrimination to paired-associate learning: II. Effects of intralist similarity, method, and percentage occurrence of response members. *J. exp. Psychol.*, 1963, 65(5), 507-514.—In agreement with previous results, paired-associate (PA) performance was not significantly facilitated on pairs identical to those of a previous verbal-discrimination (VD) list, whereas poorer performance resulted if the VD and PA items were paired differently, as compared with PA items excluded from the VD list. These transfer effects were unaffected by intralist similarity or percentage occurrence of response members (ORM), but were largely eliminated under the recall method of PA learning. Contrary to previous findings, overall recall-method PA performance was only insignificantly superior to that under the standard anticipation method. Moreover, a contrasting distinct superiority of the anticipation method was found under conditions of 50% ORM, especially for medium intralist similarity.—*Journal abstract.*

7582. Bugelski, B. R., & Rickwood, J. (U. Buffalo) Presentation time, total time, and mediation in paired-associate learning: Self-pacing. *J. exp. Psychol.*, 1963, 65(6), 616-617.—The present report supplements an earlier study where it was shown that while Ss who have long presentation times learn paired associates in fewer trials than Ss with short presentation times, total learning time is the same. 20 college student Ss controlled their own presentation times for the same material. Their total learning times did not vary significantly from the earlier study. It is concluded that a fixed amount of time is required to learn a fixed amount of material regardless of distribution of time over continuous trials.—*Journal abstract.*

7583. Goggin, Judith. (U. California) Influence of the written recall measure on first-list associations. *J. exp. Psychol.*, 1963, 65(6), 619-620.—An experiment using A-B, A-C and A-B, A-B' paradigms was due to ascertain if first-list responses are available even though the associations are extinguished. The recall task was designed to maximize response recall. Response recall for both lists was higher in the A-B, A-B' group. Considering the stringent scoring method alone, differences between lists, paradigms, and interaction between lists and paradigms were significant. The general results confirm Barnes and Underwood's (1959) conclusion that both the associations are extinguished and the re-

sponses are unavailable after learning the A-C list.—*Journal abstract.*

7584. Horowitz, Leonard M., & Larsen, Suzanne R. (Stanford U.) **Response interference in paired-associate learning.** *J. exp. Psychol.*, 1963, 65(3), 225-232.—Response familiarization can facilitate or hinder subsequent paired-associate (PA) learning, but the critical task-variables have not been known. The present study suggests that items learned during familiarization may compete with the responses of the PA task. 80 Ss participated in a familiarization task and then learned English-Japanese word pairs by the PA or associative matching method. (In associative matching S does not produce the responses, so extralist responses cannot intrude.) Group I was familiarized with only relevant responses; Group II, with irrelevant but similar responses; Group III, with irrelevant, dissimilar responses; and Group IV had no familiarization. In associative matching the performance of Groups I and II was superior to that of Groups III and IV ($p < .001$). In PA learning the performance of Group I was facilitated while that of Group II was hindered ($p < .05$). (15 ref.)—*Journal abstract.*

7585. Jensen, Arthur R. (U. California) **Serial rote-learning: Incremental or all-or-none?** *Quart. J. exp. Psychol.*, 1963, 15(1), 27-35.—If the associative connections in a serial list are acquired in an all-or-none fashion, rather than gradually with every trial adding an increment of associative strength, then changing the serial order of the middle items in the list during the course of practice should have no effect on the rate of learning the list as a whole or even of the particular items that have been interchanged. 30 Ss learned a serial list by the anticipation method. The middle items of the list were reversed in serial order approximately half-way through the number of trials required for mastery. The Ss took no longer to learn the list and made no more errors than did 30 control Ss for whom there was no change in serial order. The serial-position curves of the 2 groups were almost identical. It was also shown that the learning "curves" of single items in the series, when plotted for individual Ss do not reveal a gradually increasing probability of the correct response, but show instead a sudden jump on one trial from the chance guessing level to a level close to 100% correct responses. The results are consistent with a nonincremental theory of serial learning.—*Journal abstract.*

7586. Kausler, Donald A., & Kanoti, George A. (St. Louis U.) **R-S learning and negative transfer effects with a mixed list.** *J. exp. Psychol.*, 1963, 65(2), 201-205.—Transfer effects (both S-R and R-S) were investigated within a mixed list (C-D, C-B, A-C, A-B). 60 Ss learned List 1 (A-B) to a criterion and then received 10 trials on the mixed list (List 2). An R-S trial was given for each list. C-B pairs yielded significant negative transfer, confirming Twedt and Underwood's (1959) earlier finding. The amount of transfer for C-B pairs correlated with R-S score on C-B pairs ($r = .35$ for relative transfer), providing support for a confusion hypothesis. The paradigms differed significantly in R-S score on List 2, with C-D the greatest amount, then A-C, C-B, and A-B. C-D increased significantly in R-S recall from List 1 to 2, A-B, decreased significantly, and A-C and C-B were unaffected.—*Journal abstract.*

7587. Kjeldergaard, Paul M. (Harvard U.) **Predicting paired-associate learning speed.** *Psychol. Rep.*, 1962, 11(2), 353-354.—Scores on Part V of the Modern Language Aptitude Test were significantly correlated with paired-associate learning speed in 2 studies with a total of 158 students. Use of these scores for partially controlling differences in rote learning ability is advocated.—*B. J. House.*

7588. Kleinsmith, Lewis J., & Kaplan, Stephen. (U. Michigan) **Paired-associate learning as a function of arousal and interpolated interval.** *J. exp. Psychol.*, 1963, 65(2), 190-193.—This experiment tested the hypothesis that due to the phenomenon of preservative consolidation, a pattern perceived under high arousal should show stronger permanent memory and weaker immediate memory than a pattern accompanied by low arousal. While recording skin resistance as a measure of arousal, 48 Ss were presented 8 paired associates for learning. The Ss were tested at various time intervals: 2 min., 20 min., 45 min., 1 day, and 1 wk. The results confirmed the hypothesis ($p = .001$). Paired associates learned under low arousal exhibited high immediate recall value and rapid forgetting. High arousal paired associates exhibited a marked reminiscence effect, that is, low immediate recall and high permanent memory.—*Journal abstract.*

7589. Kothurkar, V. K. (U. Poona) **Effect of stimulus-response meaningfulness on paired-associate learning and retention.** *J. exp. Psychol.*, 1963, 65(3), 305-308.—Ss learned, recalled, and relearned 4 differently constituted paired-associate lists, consisting of dissyllables and paralogues of high and low meaningfulness. Both stimulus and response meaningfulness facilitated learning though the effect of the latter was much greater. As expected, the increasing rank order of difficulty of High-High, Low-High, High-Low, and Low-Low was obtained for learning; however, this hierarchy of effects was distributed in the case of retention by Low-High scoring over even High-High. High meaningful responses are better remembered when paired with low meaningful stimuli than when associated with high meaningful stimuli. Inferior retention of High-High was explained in terms of spontaneous recovery of older connections and interference from them.—*Journal abstract.*

7590. Landauer, Thomas K. (Dartmouth Coll.) **Two states of paired-associate learning.** *Psychol. Rep.*, 1962, 11(2), 387-389.—14 students were presented with 9 consonant trigram pairs, then tested with stimulus terms only. "Items which were not correctly recalled after a single trial on a paired-associate list were tested again by a recognition method. Significantly more items were recognized than would be expected by chance, demonstrating that some learning does occur on trials which do not yield sufficient learning to produce recall."—*B. J. House.*

7591. Marston, Albert R., & Kanfer, Frederick H. (U. Wisconsin) **Group size and number of vicarious reinforcements in verbal learning.** *J. exp. Psychol.*, 1963, 65(6), 593-596.—The relationship of group size to vicarious reinforcement (VR) was investigated under conditions controlled either for number or percentage of reinforced responses heard by Ss in simulated groups. The effect of adding direct reinforcement (DR) to the observing S was examined at each level of group size. In a modi-

fied verbal conditioning task, with "Good" as reinforcer and Humans as critical class, Ss said words intermittently with a recorded voice. It was found that decreasing proportion of reinforced vicarious responses by increasing group size resulted in significantly lower learning. When number of reinforcements increased (proportion held constant), learning curves did not differ. Adding DR to VR did not significantly increase learning at any level of group size.—*Journal abstract.*

7592. Martin, Clessen J., & Saltz, Eli. (Wayne State U.) Serial versus random presentation of paired associates. *J. exp. Psychol.*, 1963, 65(6), 609-615.—The effect of constant serial order in presentation of paired associates was investigated in 2 experiments. Experiment I (100 Ss) found that constant order resulted in serial associations between the response items of the pairs (significant beyond .01) but, contrary to other studies, did not facilitate paired-associate learning. Experiment II (72 Ss) tested the hypothesis that facilitory effects due to constant order were a function of S-R presentation rate. Contrary to prediction, no facilitory effect occurred at any presentation rate. Results indicate that, contrary to previous belief, serial presentation of paired associates does not necessarily facilitate learning.—*Journal abstract.*

7593. McCullers, John C. (U. Texas) An analysis of some factors underlying intralist associative transfer in paired-associate learning. *J. exp. Psychol.*, 1963, 65(2), 163-168.—A within-list method proposed by Spence for varying associative strength and degree of competition in paired-associate learning served as the basis of a logical analysis. With Spence's method as the basic model the analysis resulted in the formulation of 2 new models. 48 6th grade children served as Ss in an investigation of these 3 models. The results supported an hypothesis that number and type of competitive connections are important in determining the degree of intralist associative transfer. A general implication was that the new models might prove less complicated than the original method for the purpose of assessing hypotheses relating to the interaction of habit and drive.—*Journal abstract.*

7594. Peterson, Lloyd R., Brewer, Charles L., & Bertuccio, Richard. (Indiana U.) A guessing strategy with the anticipation technique. *J. exp. Psychol.*, 1963, 65(3), 258-264.—The capacity of Ss to utilize memory for recently presented responses to maximize guessing success was studied in 2 experiments. A serial anticipation technique was used with a list of 9 words. In Experiment I the same words were used in a paired-associate task. Ss tended to give responses which had not previously been presented on the current trial. Correct responses increased significantly toward the end of a trial. Omissions increased from beginning to end of a trial. It was considered that a guessing strategy could produce the latter portion of the serial error curve, and in any list-learning inflate estimates of associative strength obtained by scoring anticipations.—*Journal abstract.*

7595. Rock, Irvin, & Steinfeld, George. (Yeshiva U.) Methodological questions in the study of one-trial learning. *Science*, 1963, 140(Whole No. 3568),

822-824.—The substitution method may lead to poorer learning than the customary repetition method when learned pairs are eliminated after each trial. This results from a procedure in which the S is required to spell the response. Spelling leads to greater difficulty in learning the response item but repetition tends to counteract it.—*Journal abstract.*

7596. Schulz, R. W., & Tucker, I. F. (State U. Iowa) Stimulus familiarization and length of the anticipation interval in paired-associate learning. *Psychol. Rec.*, 1962, 12, 341-344.—Previous studies with anticipation intervals from 1.0 to 2.5 sec. found that articulating the stimuli during a familiarization period (SF) facilitated P-A learning when S was required to pronounce stimuli and retarded it when S was instructed not to pronounce. The present study tested the hypothesis that a longer anticipation interval of 4 sec. would show no or substantially reduced facilitation or inhibition. Results showed no effect of SF.—*R. J. Seidel.*

7597. Wittrock, M. C. (U. California, Los Angeles) Effect of certain instructions upon conceptually mediated learning. *J. educ. Psychol.*, 1963, 54(2), 85-88.—To test the effect of certain sets upon learning, written passages on Buddhism were given to 143 college students. Before they read the passage 3 groups of Ss were given, respectively, a set to compare, contrast, and compare and contrast Buddhism with Christianity. A 4th group of Ss was given a set to understand and to remember the content of the passage on Buddhism. The data were analyzed by *t* tests for differences between means. Although Group 1 was not significantly different ($p > .05$, 2-tailed) from Group 4, Groups 2 and 3 were significantly different ($p < .05$, 2-tailed) from Group 4 on both the learning and retention tests. It was concluded that learning sets are important variables in some types of complex verbal learning.—*Journal abstract.*

Reinforcement (Including Probability Learning)

7598. Hetherington, Mavis, & Ross, Leonard E. (U. Wisconsin) Effect of sex of subject, sex of experimenter, and reinforcement condition on serial verbal learning. *J. exp. Psychol.*, 1963, 65(6), 572-575.—Sex of S, sex of E, and verbal reinforcement condition were investigated in a serial trigram learning situation. 10 male and 10 female Es each ran 24 Ss—12 males and 12 females equally divided into verbal reward, neutral, and verbal punishment conditions. Sex of E and interactions involving this factor were not significant, but the E and E × Reinforcement Condition × Sex of S variables, were significant. A significant Sex of S × Reinforcement Condition interaction was found. Male performance differences across reinforcement conditions were not significant but females learned significantly faster under reward or punishment than under neutral conditions. Females learned significantly more rapidly than males only under the punishment condition.—*Journal abstract.*

7599. Kanfer, Frederick H., & Marston, Albert R. (U. Oregon Medical School) Human reinforcement: Vicarious and direct. *J. exp. Psychol.*, 1963, 65(3), 292-296.—4 experimental groups of 9 Ss each said words intermittently with a taped simulated group in a verbal conditioning task. In a factorial

design groups were given vicarious reinforcement (VR), direct reinforcement (DR), both, or neither. VR consisted of Ss listening to E's "Good" when a taped S gave a critical response. DR consisted of saying "Good" directly to S. Control groups heard tapes with fewer critical responses and no VR, or no tape. Half of the Ss in each condition were directly reinforced, half were not reinforced. In extinction no tape was played. VR significantly facilitated learning in experimental groups, with DR showing no additional effects. The control groups failed to learn. Extinction differences were due to differences in acquisition levels.—*Journal abstract.*

7600. Levin, Gerald R., & Simmons, John J., III. (Brown U.) Response to food and praise by emotionally disturbed boys. *Psychol. Rep.*, 1962, 11(2), 539-546.—In a previous experiment, 6 of 12 boys quickly stopped responding in an operant (marble dropping) discrimination task upon the introduction of verbal praise as a reinforcer. In the present study, 3 of the 6 boys performed on the same task with peanuts as reinforcement and the other 3, matched for performance on the previous task, performed with peanuts plus verbal praise. Peanut reinforcement significantly increased duration and rate of responding. Comparison of the 2 groups suggested that praise suppressed response rate. Thus results were consistent with a reinforcement theory of the boy's behavior rather than an explanation based on attention span or frustration tolerance.—B. J. House.

7601. Shaffer, Juliet Popper. (U. Kansas) Effect of different stimulus frequencies on discrimination learning with probabilistic reinforcement. *J. exp. Psychol.*, 1963, 65(3), 265-269.—A model developed by Burke and Estes generated predictions for a 2-stimulus (T_1, T_2), 2-response (A_1, A_2) successive discrimination learning problem, which consisted of predicting which of 2 reinforcing events, E_1 or E_2 , would occur on each of the 324 trials. The probability of E_1 was 1.00 on T_1 trials and .50 on T_2 trials. 3 groups of 32 Ss each differed in the probability (β) of T_1 trials. It was predicted that the final observed proportions of A_1 responses on T_1 and T_2 trials [$P(A_1|T_1)$ and $P(A_1|T_2)$] would be linear increasing functions of β , with equal slopes. The final $P(A_1|T_1)$ was a linear increasing function of β ($p < .01$) while the final $P(A_1|T_2)$ was a linear decreasing function ($p < .05$). Thus, the results did not conform to the predictions derived from the model.—*Journal abstract.*

7602. Schusterman, Ronald J. (Yerkes Lab. Primate Biology) Influence of patterns and percentages of reinforcement on resistance to extinction. *Psychol. Rep.*, 1962, 11(2), 573-574.—"Thirty-nine Ss served in a verbal-expectancy task. The results revealed that the effects of patterning (reinforcement or nonreinforcement termination) and percentages (75% or 25%) interact during extinction. There was a greater resistance to extinction with reinforcement termination, but only under the 75% condition."—B. J. House.

Learning Theory

7603. Anderson, Norman H. (U. California, Los Angeles) Comparison of different populations: Resistance to extinction and transfer. *Psychol.*

Rev., 1963, 70(2), 162-179.—The problem is considered of comparing resistance to extinction when a "correction" for systematic differences in initial extinction response level is required. It is shown that the most commonly used correction procedures have limited merit. 2 other approaches are taken up. A specific mathematical model may be employed and some parameter of the model used as a measure of resistance to extinction. The advantages of this approach are balanced by its limited applicability. The shape function method, which has considerable generality, is presented and statistical test procedures are derived for it. Some applications are also pointed out for other areas of learning. (33 ref.)—*Journal abstract.*

7604. Berlyne, D. E. (U. Toronto) Comments on Prokasy's reply. *Psychol. Rep.*, 1962, 11(2), 581-582.—"Questions raised by Prokasy [see 37: 7771], regarding measurement of degree of conflict and the role of conflict in intermittent reinforcement, are discussed."—B. J. House.

7605. Stone, David R. (Utah State U.) A gross features model of human learning. *Psychol. Rep.*, 1962, 11(2), 367-374.—A schematic representation of 32 human learning factors is presented as a guide for study. Factors are classified under 4 major headings: The Learning Situation, Readiness of the Organism, Interpretation (e.g., perception, cognition), and The Trial (e.g., distribution, reinforcement). Each factor is illustrated by examples of related research.—B. J. House.

7606. Suppes, Patrick, & Ginsberg, Rose. (Stanford U.) A fundamental property of all-or-none models, binomial distribution of responses prior to conditioning, with application to concept formation in children. *Psychol. Rev.*, 1963, 70(2), 139-161.—A basic assumption of the simple all-or-none conditioning model is that the probability of a correct response remains constant over trials before conditioning. 4 implications of this assumption were tested: (a) prior to the last error there will be no evidence of learning, (b) the sequence of responses prior to the last error forms a sequence of Bernoulli trials, (c) responses prior to the last error exhibit a binomial distribution, and (d) specific sequences of errors and successes are distributed in accordance with the binomial hypothesis. These 4 tests were performed on the data from 7 experiments concerned with concept formation in children, paired-associate learning and probability learning in adults, and T maze learning in rats. The statistical evidence from these various experimental groups provided substantial support of the all-or-none model. However, when Vincent curves were constructed for responses prior to the last error, some of the learning curves showed significant departures from stationariness.—*Journal abstract.*

RETENTION & FORGETTING

7607. Baddeley, A. D. (Medical Research Council, Cambridge, England) A Zeigarnik-like effect in the recall of anagram solutions. *Quart. J. exp. Psychol.*, 1963, 15(1), 63-64.—Ss were asked to solve a series of 12 anagram problems. For each of these they were allowed 1 min. and if they did not solve it in this time they were told the solution. When asked to recall the solution words at the end of the series,

Ss remembered items they had failed to complete almost twice as often as those they had solved. It is suggested that this phenomenon is analogous to the Zeigarnik effect, but that it has the advantage of occurring in conditions which are easy to specify and control.—*Journal abstract.*

7608. Brackbill, Yvonne; Isaacs, Robert B., & Smelkinson, Norman. (U. Colorado Medical School) Delay of reinforcement and the retention of unfamiliar, meaningless material. *Psychol. Rep.*, 1962, 11(2), 553-554.—4 groups of 3rd-grade boys ($N = 24$) were required to learn the correct item in each of 18 pairs of bigrams with either 0- or 10-sec. delay of reinforcement. Length of delay did not affect acquisition. During relearning, 1 or 8 days after acquisition, the 10-sec. delay groups did significantly better than the 0-delay groups. This replication of previous studies using familiar stimulus material shows the facilitating effect of delay on retention present for unfamiliar material as well.—B. J. House.

7609. Fitzgerald, Donald, & Ausbel, David P. (U. Alberta) Cognitive versus affective factors in the learning and retention of controversial material. *J. educ. Psychol.*, 1963, 54(2), 73-84.—264 Illinois high school students studied a passage presenting a Southern interpretation of the Civil War. When general knowledge about the Civil War period was held constant in an analysis of covariance design, the differential effect of attitudinal bias on retention was eliminated. This finding suggests that it is the lack of appropriate subsuming concepts in attitude structure, rather than the direct effect of affective factors on retention processes, that renders "other side" arguments more susceptible to forgetting. Further substantiating the greater relative importance of cognitive factors were the facts that the more knowledgeable Ss learned more than the less knowledgeable Ss, and that an organizing passage facilitated retention.—*Journal abstract.*

7610. Green, Donald Ross. (Emory U.) Volunteering and the recall of interrupted tasks. *J. abnorm. soc. Psychol.*, 1963, 66(4), 397-401.—It was hypothesized that the proportion of interrupted tasks recalled would be greatest among volunteers serving by choice and least among draftees not willing to volunteer, with draftees who had been willing to volunteer falling between the 2. Within each of these 3 groups those given task orienting instructions were expected to recall greater proportions of interrupted tasks than those given ego orienting instructions. College students divided into 6 groups of 16 Ss each in a 3×2 factorial design were tested individually using the standard Zeigarnik procedure. The results conformed to expectations although the differences among the volunteering groups were small. It was argued that differences in degree of task involvement and ego involvement account for these results.—*Journal abstract.*

7611. Green, Robert T., & Harding, Graham. (University Coll. London, England) Sequential recall of a mixed list. *Brit. J. Psychol.*, 1962, 53(4), 389-396.—A previously reported finding that an item with a high probability of recall will not necessarily be emitted any earlier in a recall series was submitted to closer investigation. The anomalous result was reproduced, using the original experimental design. 2 further groups were introduced to control context ef-

fects and item uniqueness. More careful analysis shows that the factors governing order of emission during recall may be distinguished from those affecting the overall probability of recall. The 2 processes are distinct and, in some circumstances, independent. After eliminating various alternative hypotheses the outcome in the present instance was found to depend largely on previously learned associations of meaningful material. The implications of this with regard to the von Restorff effect are discussed. During the course of this experiment an interesting side effect intruded itself on the data. For reasons not at present clear, there was a significant tendency for the recall of paralogos to be disturbed in the presence of a noun, and to a lesser extent, for the recall of nouns to be disturbed by the presence of a paralog.—*Journal abstract.*

7612. Holding, D. H. (U. Leeds, England) Transfer between difficult and easy tasks. *Brit. J. Psychol.*, 1962, 53(4), 397-407.—The existing literature on unequal transfer between difficult and easy tasks shows that it is impossible to predict the direction of optimum transfer on the basis of the relative difficulty of the 2 tasks. The 1st experiment explores an absolute difficulty hypothesis to the effect that transfer might be greater from a point of optimum difficulty, whether to an easier or to a more difficult task; changes in difficulty were achieved by controlled variation of the complication of pursuit tracking courses. However, after a week's practice on the 12 task conditions, it appeared that transfer was consistently most effective in the difficult-easy direction. In a 2nd experiment Ss were transferred between tasks with easy and difficult course amplitudes, at both easy and difficult levels of complication. In this case, the easy-difficult order of practice was better with the simpler courses, while the complex courses favoured difficult-to-easy transfer. It is concluded that difficulty is not a useful category for the prediction of transfer efficiency, and that the solution lies in examining the skills involved. Explanations are outlined in terms of inclusion and error size constancy, although it is probable that many other factors play a part. (35 ref.)—*Journal abstract.*

7613. Lloyd, Kenneth E., & Johnston, William A. (Washington State U.) Short-term retention as a function of contextual constraint. *J. exp. Psychol.*, 1963, 65(5), 460-467.—Contextual constraint has improved recall in the classic memory span task. Here this variable was manipulated in a sequential memory task in which S continually received information, and, at unpredictable moments, was requested to recall some of it. In Experiment I 24 undergraduates continuously stored an average of 3 or 7 items and recalled them 2 at a time. This required many recall points which interrupted the continuity of contextual passages. The effect of varying contextual constraint was significant ($p < .01$), but small. In Experiment II interruptions were gradually reduced by requesting more and more items per recall point. Recall improved ($p < .01$) as constraint increased and as interruptions decreased; these variables interacted. Interruptions severely curtailed the benefits of context.—*Journal abstract.*

7614. Murdock, Bennet B., Jr. (U. Vermont) Short-term retention of single paired associates. *J. exp. Psychol.*, 1963, 65(5), 433-443.—6 experi-

ments investigated the short-term retention of single paired associates. Ss learned individual A-B pairs during 1 presentation of a list, then tried to recall the B member of the critical pair given A as the cue for recall. The first 2 experiments were replications of a previous study with number of prior pairs the parameter, the 2nd 2 experiments controlled for list length by using 6-pair lists, and the 3rd set of experiments attempted to assess the role of proactive inhibition (PI). Marked forgetting of single pairs consistently occurred within a retention interval of 6-10 sec., and increasing the number of prior pairs slightly decreased probability of recall. Very little interlist PI occurred, and the intralist PI decreased over time in contrast with the increase in PI over time that is usually found in the study of long-term retention.—*Journal abstract.*

7615. Waugh, Nancy C. (Harvard U.) **2 methods for testing serial memorization.** *J. exp. Psychol.*, 1963, 65(2), 215-216.—The learning curve obtained with the method of serial recall (alternate viewing and recall of an entire list) is compared with that obtained with the classical method of anticipation. Both are rectilinear with almost identical slopes. Each can be interpreted to represent a cumulation of memory spans over trials, in accordance with the results of previous studies.—*Journal abstract.*

THINKING

7616. Hilgard, Ernest R. (Stanford U.) **Impulsive versus realistic thinking: An examination of the distinction between primary and secondary processes in thought.** *Psychol. Bull.*, 1962, 59(6), 477-488.—The nature of the distinction between primary and secondary processes, as described by Freud, has relevancy for both a cognitive psychology and a psychology of motivation. Several issues arising from an examination of the 2 processes are examined. Possible empirical approaches to the basic problems are presented.—*W. J. Meyer.*

7617. Maltzman, Irving. (U. California, Los Angeles) **Motivation and the direction of thinking.** *Psychol. Bull.*, 1962, 59(6), 457-467.—Many, but not all, of the problems involved in directed thinking can be explained in terms of associative variables. It is likely that nonassociative variables of the process need type (defined as labile, implicit responses occurring in the individual, i.e., conflict induced drive) may be needed to completely account for motivated thinking. S-R formulations represent a promising approach.—*W. J. Meyer.*

7618. Neisser, Ulric. (Brandeis U.) **The multiplicity of thought.** *Brit. J. Psychol.*, 1963, 54(1), 1-14.—Many writers have distinguished 2 types of mental processes. One kind of thinking is conscious, straightforward, predictable, and rather pedestrian; the other is confused, rich, productive of novelty, emotionally charged, and generally outside of consciousness. It is suggested that the latter arises from a multiplicity of processes going on together, while the former represents a single sequence among the crowd. These concepts are clarified by showing that sequence and multiplicity arise as alternative modes of organizing computer programs for pattern recognition. Even in the computer, multiple processing exhibits a superior ability to deal with novel or irregular input, while sequential processing appears less wasteful, and

better adapted to fully predictable situations. The properties that have been said to distinguish primary and secondary process, autistic and realistic thinking, creativity and constraint, insightful and rote activity, and the like, are shown to follow from the multiplicity of thought. Relevant experimental findings are discussed. (23 ref.)—*Journal abstract.*

7619. Pyron, H. Charles, & Sharp, Harry, Jr. **A quantitative study of reflective thinking and performance in problem-solving discussion.** *J. Commun.*, 1963, 13(1), 46-53.—This study tested the hypothesis that the "reflective thinking ability of a discussant whose performance is ranked 'high' will be significantly greater than the reflective thinking ability of a discussant whose performance is ranked 'low.'" Reflective thinking was measured by the Johnson Reflective Thinking Test. Ss in a public speaking course were ranked by the instructor on the basis of the contribution made to the discussion by the speaker. The Johnson test was then administered to the discussants ranked 1st and last in each group. Statistical comparison of test means for Ss ranked high vs. low by instructors was significant in the predicted direction.—*D. E. Meister.*

7620. Vinacke, W. Edgar. (U. Hawaii) **Motivation and thinking: A symposium.** *Psychol. Bull.*, 1962, 59(6), 449.—This brief note serves as an introduction to 4 papers originally presented at the 1961 Western Psychological Association meeting: W. E. Vinacke's The complexities of thinking (see 37: 7621); Irving Maltzman's Motivation and the direction of thinking (see 37: 7617) Ronald C. Johnson's Linguistic structure as related to concept formation and to concept content (see 37: 7626); and Ernest R. Hilgard's Impulsive versus realistic thinking: An examination of the distinction between primary and secondary processes in thought (see 37: 7616).—*W. J. Meyer.*

7621. Vinacke, W. Edgar. (U. Hawaii) **The complexities of thinking.** *Psychol. Bull.*, 1962, 59(6), 450-456.—Historically, the interaction of motivation and thinking has been included in many theories. It is only recently that efforts to specify the relevant variables in the laboratory have begun. Clearly the relation between thinking and motivation is complex, but recent research shows that these relationships may systematically be explored.—*W. J. Meyer.*

Problem Solving

7622. Kolers, Paul A., & Zink, Donald L. **Some aspects of problem solving: Sequential analysis of the detection of embedded patterns.** *USAF AMRL tech. docum. Rep.*, 1962, No. 62-148. iii, 14 p.—Performance on a forced-choice target detection task was examined in terms of the sequences of responses Ss made. In about 50% of all cases resulting in a correct detection, Ss made a specific error immediately before identifying the correct target. Practice on the task resulted in a general improvement in speed and number of correct detections, and also in a change in the proportional occurrence of certain errors. In addition, while the best 25% of the Ss detected more targets to criterion and did so more rapidly than the poorest 25%, the proportional occurrence of specific response patterns was approximately the same in the 2 groups for the targets that were correctly detected. Scaled similarity of the alternatives was an important

determiner of errors, while perceived orientation had no relation either to perceived similarity or to the response sequences. A mechanism is suggested for these sequential acts involving a decrease in probability of detecting specific kinds of forms following perception of another kind. (18 ref.)—*USAF AMRL*.

Concepts

7623. Bourne, Lyle E., Jr. (U. Utah) Long-term effects of misinformation feedback upon concept identification. *J. exp. Psychol.*, 1963, 65(2), 139-147.—The purposes of this study were to investigate the long-term effects of misinformative feedback (MF) upon performance in a concept identification problem (Task 1) and the transferability of optimal solution to a 2nd problem (Task 2). The results indicated that as amount of MF increased in Task 1, Ss made more errors and fewer Ss reached optimal solution. Transitory probability matching was observed. All Ss attained optimal solution to Task 2, at a rate, however, which was a function of Task 1 MF. There were no marked recency effects and little evidence that Ss attempted to respond with the category indicated by the feedback signal accompanying each stimulus on its last presentation.—*Journal abstract*.

7624. Feldman, Solomon E. (Indiana U.) Probabilistic hierarchies to ambiguous concept classes. *J. exp. Psychol.*, 1963, 65(3), 240-247.—In a test of a statistical model of visual recognition, 160 Ss learned to anticipate the nonsense syllable names of 4 types of stimulus displays, each of which included an outline figure and a word. Subsequent responses to differing cue combinations indicated that: (a) the probabilities of sampling various cues from among a larger set of cues and the probability of responses to cues that have been sampled are both functions of the relative and absolute frequencies of previous reinforcement, (b) stimulus elements are associated with patterns of cues rather than with the individual cues comprising the patterns, and (c) response dependencies only occur when repeated responses to the same type of stimulus are required.—*Journal abstract*.

7625. Foulkes, David, & Heaxt, Susan. (Lawrence Coll.) Concept attainment and self-concept. *Psychol. Rep.*, 1962, 11(2), 399-402.—100 undergraduates were given a concept learning task in which positive instances contained a reference to a personal attribute, and negative instances to its opposite. For 4 groups, relevant dimensions were intelligent-unintelligent, good looking-unattractive, dominant-submissive, and warm-cold, respectively. Concept attainment was not related to self-attribution along the relevant dimension nor to self-ideal correlation as determined by a modification of the Chicago Q sort, but was positively correlated with Scholastic Aptitude Test scores.—*B. J. House*.

7626. Johnson, Ronald C. (U. Hawaii) Linguistic structure as related to concept formation and to concept attainment. *Psychol. Bull.*, 1962, 59(6), 468-476.—“... we have examined two explanations of empirical data showing that concrete-perceptual concepts are learned to an adult level of understanding earlier than are abstract concepts. Data do not fully support a developmental explanation. A linguistic relativistic position is supported, but not proved to be correct.”—*W. J. Meyer*.

DECISION & INFORMATION THEORY

7627. Agnew, N., Pyke, S., & Pylyshyn, Z. (U. Saskatchewan, Canada) Information transfer in absolute judgment as a function of noxious stimulation and exposure time. *Percept. mot. Skills*, 1962, 15(3), 779-782.—In this study the effects of shock and exposure duration on consistency and accuracy of absolute judgments of distance were investigated. Long exposures led to significant increases in both consistency and accuracy of judgments, while shock had no effect on either performance measure. Heart rate increased significantly under both task and shock conditions.—*W. H. Guertin*.

7628. Bixenstine, V. Edwin; Potash, Herbert M., & Wilson, Kellogg V. (Kent State U.) Effects of level of cooperative choice by the other player on choices in a prisoner's dilemma game: Part I. *J. abnorm. soc. Psychol.*, 1963, 66(4), 308-313.—In a Prisoner's Dilemma type game, Ss (male and female students) were asked to make repeated choice between 2 alternatives, R and B, where R is presumably the cooperative and B the competitive choice. While believing that they were playing persons of the same sex, Ss actually played a simulated partner who, for ½ of the group, chose 83% random R and, for the other ½, 83% random B for 30 trials. Thereafter for 60 trials, the simulated partner chose according to a strategy of 83% matching, 17% mismatching the choices of S. The purpose of this procedure was to determine the effects of initial level of simulated cooperation on S's own level of cooperation. The results failed to demonstrate that the level of simulated cooperation employed functioned to determine choice by S. Ss had been stratified according to a test of character which failed to predict choice. However, a 2nd scoring formula employed on this test did significantly distinguish the amount of R choice emitted by S and deserves further examination.—*Journal abstract*.

7629. Brehm, Jack W., & Cohen, Arthur R. (Duke U.) Explorations in cognitive dissonance. New York: Wiley, 1962. xv, 334 p. \$7.95.—This book contains a comprehensive critical evaluation of the empirical evidence bearing on Festinger's theory of cognitive dissonance, a serious consideration of the methodological problems involved in testing the theory, and a discussion of its ambiguities. The authors emphasize the critical role of commitment and choice for the arousal of dissonance in the individual experiencing inconsistent cognitions and point out the ways in which this emphasis differentiates dissonance theory from other balance theories. They also report 13 of their unpublished studies—some of which extend the theory to primary motivation and volition; discuss the relation of the theory to conflict and decision theories; and discuss the implications of the theory for attitude change, personality dynamics, desegregation, and indoctrination processes.—*K. E. Davis*.

7630. Chambers, R. W., & Bartlett, N. R. (U. Arizona) A device for research in human information processing capacity. *Percept. mot. Skills*, 1962, 15(2), 343-350.—The device is a fully automated electronic system which permits examination of the following variables: probability of event occurrence, probabilities with respect to time, complexity

in terms of codebook size and in terms of information, contained in a signal, rate of flow of information, number of units of information presented in the same time unit, and comparison of unisensory versus bisensory information processing. To identify the device in future articles, the name Bisensory Unilateral Response Processor (BURP) was selected. A description of the physical appearance of the device as well as an indication of its method of operation is furnished.—*W. H. Guertin.*

7631. Fitts, Paul M., Peterson, James R., & Wolpe, Gerson. (U. Michigan) **Cognitive aspects of information processing: II. Adjustments to stimulus redundancy.** *J. exp. Psychol.*, 1963, 65(5), 423-432.—3 experiments are reported in which relative stimulus frequencies were varied in 9 choice tasks. The tasks involved naming numbers and pointing to lights. It was found that as redundancy increased average RTs to the frequent stimulus component decreased whereas RTs to less frequent components increased, the differences being a linear function of redundancy. These effects were greater for the less compatible (vocal) task. Ss used the frequent response more often and the infrequent response less often than appropriate in responding to redundant sequences. These results are in agreement with predictions from a stimulus sampling and sequential decision model in which it is assumed that RTs and errors are a function of prior probabilities and the payoff matrix for correct and wrong, slow and fast responses, as well as a function of stimulus discriminability. (20 ref.)—*Journal abstract.*

7632. Kintsch, W. (U. Missouri) **A response time model for choice behavior.** *Psychometrika*, 1963, 28(1), 27-32.—An S in a 2-choice situation characteristically makes several observing responses before performing the final choice. This behavior can be described by means of a random walk model. The present paper explores some possibilities as to how this model can be extended to include choice time. The assumption is made that the duration of each step in the random walk is a random variable which is exponentially distributed. With this assumption, one can predict the probability distributions of the choice times as well as the moments of these distributions.—*Journal abstract.*

7633. Rettig, Salomon, & Rawson, Harve E. (Ohio State U.) **The risk hypothesis in predictive judgments of unethical behavior.** *J. abnorm. soc. Psychol.*, 1963, 66(3), 243-248.—The study further explores the "ethical risk" hypothesis, which postulates that unethical behavior varies as a function of perceived risk. 6 determinants are tested: expectancy of gain (E_{gn}) and reinforcement value of gain (RV_{gn}), expectancy of censure (E_{cens}) and reinforcement value of censure (RV_{cens}), severity of offense, and reference group. It is hypothesized that E_{cens} and RV_{cens} are significant determinants which account for more variance than the remaining ones. 64 items, each portraying a student in conflict about taking money illegally, were judged by 136 Ss as to the probability of taking the money. Except for the reference group, all main effects were significant. RV_{cens} explained more variance than any other source. Hence, ethical risk should be interpreted as RV_{cens} rather than E_{cens} . (15 ref.)—*Journal abstract.*

PHYSIOLOGICAL PSYCHOLOGY

7634. Crampton, George H. (USA Medical Research Lab., Ft. Knox, Ky.) **Effects of visual experience on vestibular nystagmus habituation in the cat.** *Acta oto-laryngol., Stockholm*, 1962, 55(5-6), 516-526.—Separate groups of 10 cats each were exposed to 3 specific varieties of visual experience during a series of angular accelerations, and then compared on a test trial in darkness with 3 control groups of 10 cats each that had received the same acceleration experience but without concomitant visual stimulation. Animals were maintained in a high state of arousal with d-amphetamine. Electro-oculographic recordings showed that the nystagmic response decrement was prominent for all 6 groups and that the visual experience neither hastened nor slowed the habituation process.—*Journal abstract.*

7635. Dolowitz, D. A., Forssman, B., & Henriksson, N. G. (U. Lund, Sweden) **Studies of cristospinal reflexes (laterotorsion): III. Patterns of cristooocular and cristospinal reflexes in clinical oto-neurology.** *Acta oto-laryngol., Stockholm*, 1962, 55(5-6), 496-504.—A comparative study of caloric nystagmus, vertigo, and laterotorsion was made in normal Ss and in patients with peripheral labyrinthine lesions, Ménière's disease, meningo-encephalitis, and brain tumors. Variations were found in the patterns of behavior in the various lesions. As examples: in Ménière's disease, nystagmus and vertigo decreased in their responses to caloric stimulation but laterotorsion remained normal, while meningo-encephalitis showed a normal response of nystagmus but a decrease in laterotorsion. This induced us to consider the hypothesis that cristo-ocular and cristospinal reflexes have different mechanisms modulating them despite the common origin of their stimulus. The possibility of different receptor cells and neurons for the cristooocular and the cristospinal reflexes was also discussed. A better resistance of the units involved in the vestibulospinal reflex would then also explain the normal caloric laterotorsion in Ménière cases.—*Journal abstract.*

7636. Hamilton, C. L. (VA Hosp., Coatesville, Pa.) **Interactions of food intake and temperature regulation in the rat.** *J. comp. physiol. Psychol.*, 1963, 56(3), 476-488.—A series of studies is presented demonstrating some of the interrelationships between food intake, body temperature, and hypothalamus. These include the effects of ambient temperature, diet, activity, and hypothalamic lesions on the energy balance of the rat. Finally, a theory of the relationships among the variables of thermal balance and food intake is presented. (20 ref.)—*Journal abstract.*

7637. Hertzman, Alrick B., & Flath, Franz. (St. Louis U. School Medicine) **Continuous simultaneous registration of sweating and blood flow in a small skin area.** *USAF AMRL tech. docum. Rep.*, 1963, No. 63-16, iii, 9 p.—The report presents a capsular method for recording evaporation from a small skin area (5, 10, or more cm^2), continuously, quantitatively, and with a very fast response time as brief as 0.15 sec. Water of diffusion at rates of 0.005 $mgm/cm^2/min$ or high sweating rates were measured with equal ease. The method is combined with photoelectric recording of the skin pulses to provide precise

temporal relations of cutaneous vascular events and of sweating in the same segment of skin. Cycles of sweating in forearm skin occurred synchronously with digital vasoconstrictions but were not accompanied by changes in the rate of blood flow in forearm skin, although venoconstriction in the forearm often took place with an increase in sweating. The observation contradicted the concept of bradykinin as an important vasodilator in accounting for cutaneous vasodilatation during heat stress. (18 ref.)—*USAF AMRL*.

7638. Honigfeld, G. (VA Central Neuropsychiatric Research Lab., Perry Point, Md.) "Neurological efficiency," perception, and personality. *Percept. mot. Skills*, 1962, 15(2), 531-553.—The most significant over-all conclusion from this investigation seems to be that to attempt to ascribe individual differences in perception, personality, and intelligence to a common construct of central "neurological efficiency" is to oversimplify a complex set of observations. This is consistent with Becker's (1960) conclusions from a similar study which suggest that there are several kinds of inhibitory cortical processes. It is probably not an oversimplification to assert that in their enthusiasm to obey the "law of parsimony," psychologists are often guilty of oversimplification. (91 item bibliogr.)—*W. H. Guertin*.

7639. Lindvall, Hans F. (Serafimerlasarettet, Stockholm) Specific and non-specific traits of habituation in nystagmus responses to caloric stimuli. *Acta oto-laryngol., Stockholm*, 1962, 55(4), 315-325.—In human Ss, the electronystagmographically recorded responses to repeated monolabyrinthine caloric stimuli are shown to be influenced by specific (discriminative) processes as well as by alerting (arousal). The response decline to repeated stimuli is more pronounced with identical stimuli than with stimuli that are of equal average intensity but differ in regard to their quality (cold-warm) and/or localization (right-left labyrinth). This is not due to variations in the general activation level (as reflected in the electrical skin resistance and in the electroencephalogram). Thus, the habituation process seems to be specifically linked to the direction of the cupular deflexion in the individual labyrinth, or to conscious discrimination between changes in the experimental situation as a whole.—*Journal abstract*.

7640. Lindvall, Hans F. (Serafimerlasarettet, Stockholm, Sweden) Mechanisms of motion sickness as reflected in the vertigo and nystagmus responses to repeated caloric stimuli. *Acta oto-laryngol., Stockholm*, 1962, 55(5-6), 527-536.—In the routine caloric test a group of seamen, who stated that they practically never had been motion sick, had vertigo and nystagmus responses of lower average intensity than those of a group of seamen who asserted that they were somewhat troubled by a tendency to become motion sick. Those Ss who had distinct vertigo responses and "normal" nystagmus responses at the routine test were selected for a study of the responses to repeated identical monolabyrinthine caloric stimulations. In both groups there was habituation in the vertigo and in the nystagmus responses, and the habituation curves were approximately parallel. The vestibular mechanisms which are known to be of importance in the development and persistence of motion sickness are discussed. It is concluded that the group difference observed in the

routine caloric test is probably due to a difference in the sensitivity of the labyrinthine sense organs.—*Journal abstract*.

NEUROANATOMY & PHYSIOLOGY

LESIONS & BEHAVIOR

7641. Altman, Joseph. (Massachusetts Inst. Technology) Diurnal activity rhythm of rats with lesions of superior colliculus and visual cortex. *Amer. J. Physiol.*, 1962, 202(6), 1205-1207.—Both normal rats and rats with bilateral lesions in the superior colliculus or striate cortex showed higher rates of activity at night than during the day, but the operated animals showed considerably less difference.—*D. R. Peryam*.

7642. Altman, Joseph. (Massachusetts Inst. Technology) Effects of lesions in central nervous visual structures on light aversion of rats. *Amer. J. Physiol.*, 1962, 202(6), 1208-1210.—Bilateral lesions in the superior colliculus, lateral geniculate body, or striate cortex of rats caused a reduction in the normal aversion to crossing into the bright alleys of a test apparatus. Increased locomotor activity occurred in all 3 operated groups. The reduction in light aversion seemed to depend upon the relative size of the lesion rather than the structure destroyed.—*D. R. Peryam*.

7643. Bureš, J., & Burešová, O. (Czechoslovak Acad. Sciences, Prague) Cortical spreading depression as a memory disturbing factor. *J. comp. physiol. Psychol.*, 1963, 56(2), 268-272.—The memory disturbing effect of spreading depression was studied in rats with 2 types of avoidance reaction. Electroshock applied 1 min. or 2 hr. after reversal of a left-right discrimination impaired the newly acquired memory traces more than spreading depression elicited with the same delays. The passive avoidance reaction was nearly completely suppressed by electroshock and unaffected by ether anesthesia applied immediately after learning; spreading depression was slightly less effective than electroshock. The memory disturbing procedures applied 2 hr. after learning still evoked a severe impairment of retention. Their effectiveness considerably declined when applied 6 hr. after learning.—*Journal abstract*.

7644. Byck, Robert, & Dirlik, Paul. (National Inst. Mental Health, St. Elizabeths Hosp., Washington, D. C.) Reversible section of the brain by a wall of cold. *Science*, 1963, 139(Whole No. 3560), 1216-1218.—A fork made up of hollow tubing may be chronically implanted in the cat's brain. When cooling fluid is pumped through this fork a reversible plane lesion is formed. This technique permits analysis of functional parts of the nervous system in unanesthetized animals.—*Journal abstract*.

7645. Ehrlich, Annette. (Northwestern U. School Medicine) Effects of tegmental lesions on motivated behavior in rats. *J. comp. physiol. Psychol.*, 1963, 56(2), 390-396.—In bar pressing tests with either food or water as the motivator, tegmental operatees were deficient by comparison with normals ($p < .002$ for tests using a continuous-reinforcement schedule and $p < .002$ for tests using increasing ratios of reinforcement). However, in a straight alley, with food as the motivator, tegmental operatees ran faster than normals ($p < .02$); and, in situations in which

food and water were freely available, significant differences were not found between tegmental operatees and normals. These data suggest that the amount of work involved in securing food may be a crucial variable. Operated controls with fornix-hippocampal commissure lesions performed as well as normals on some tasks and significantly better than normals and tegmental operatees on other tasks.—*Journal abstract.*

7646. Gross, Charles G. (Massachusetts Inst. Technology) **Locomotor activity following lateral frontal lesions in Rhesus monkeys.** *J. comp. Physiol. Psychol.*, 1963, 56(2), 232-236.—Effects of bilateral frontal lesions on locomotor activity were studied under various stimulus conditions. 8 monkeys were tested after, and 13 monkeys before and after, partial ablation of lateral frontal granular cortex or as unoperated controls. Ss with lesions that included sulcus principalis were hyperreactive to light. Their locomotor activity in light as well as darkness was more enhanced by relatively familiar auditory stimuli, and more depressed by relatively novel stimuli than that of unoperated Ss, or of Ss with lateral frontal lesions which spared sulcus principalis.—*Journal abstract.*

7647. Horvath, Fred E. (U. Michigan) **Effects of basolateral amygdectomy on three types of avoidance behavior in cats.** *J. comp. Physiol. Psychol.*, 1963, 56(2), 380-389.—The performance of lesioned cats was compared with that of sham-operated and nonoperated control animals. It was found that basolateral amygdaloid lesions produced a severe deficit in acquisition ($p < .001$) and retention of a complex active avoidance response ($p < .001$) and significant ($p < .05$) but smaller deficits on performance of a passive avoidance response and acquisition of a simple active avoidance response. These results were interpreted as indicating that the basolateral amygdaloid nuclei subserve an integrative function in the acquisition of avoidance responses in problem-solving situations of a high order of complexity. These nuclei are important for the retention of such a response only if the response is not overlearned. (24 ref.)—*Journal abstract.*

7648. Kimble, Daniel P. (U. Michigan) **The effects of bilateral hippocampal lesions in rats.** *J. comp. Physiol. Psychol.*, 1963, 56(2), 273-283.—The behavior of 10 rats with bilateral hippocampal lesions was compared with that of 11 cortically damaged and 12 unoperated control Ss in 4 experimental situations. Compared to other groups, hippocampal Ss (a) entered more squares of an open field ($p < .01$); (b) took more trials to reach criterion on a successive brightness discrimination ($p < .01$), but showed no deficit on a simultaneous discrimination using the same stimuli; and (c) made more errors on both of 2 Hebb-Williams mazes ($p < .01$). Both hippocampal and cortically damaged Ss showed less "passive avoidance" following shock ($p < .05$). Conclusions are: (a) either "short-term memory" deficit nor "emotional disruption" hypothesis adequately explains these data, and (b) monolithic hypotheses concerning behavioral significance of the hippocampus are likely to be oversimplifications. (17 ref.)—*Journal abstract.*

7649. Meyer, Patricia Morgan. (Ohio State U.) **Analysis of visual behavior in cats with extensive neocortical ablations.** *J. comp. Physiol. Psychol.*, 1963, 56(2), 397-401.—8 normal and 7 neocorticate

cats served as Ss. No significant differences between the normal and neocorticate animals were observed in a simple light-avoidance conditioning situation. A pattern discrimination problem indicated that the normal group was significantly superior to the neocorticate group. Visual behavior of cats with extensive neocortical ablations including visual areas I and II was assessed further with Gibson's visual cliff procedure. Again, operated cats performed like normal animals on initial choices and after several trials. However, the nature of this response is still a question for further assessment and experimentation.—*Journal abstract.*

7650. Parriss, J. R. (University Coll., London, England) **Retention of shape discrimination after regeneration of the optic nerves in the toad.** *Quart. J. exp. Psychol.*, 1963, 15(1), 22-26.—Using a method of successive discrimination previously described by the author 8 toads (*Bufo bufo*) were trained to discriminate 1st between horizontal and vertical rectangles, each 3.5×7.5 cm., and 2nd between horizontal and vertical rectangles each 5.0×7.5 cm. Immediately after training, both optic nerves were severed in 4 animals and allowed to regenerate. After a period of 10 weeks without training both the operated and nonoperated animals retained the capacity to discriminate both large and small rectangles at a level either not significantly different from training or significantly better than training.—*Journal abstract.*

7651. Rüdiger, W., & Fifková, E. (Czechoslovak Acad. Sciences, Prague) **Operant behavior and subcortical drive during spreading depression.** *J. comp. Physiol. Psychol.*, 1963, 56(2), 375-379.—The influence of unilateral cortical spreading depression (SD) on lever pressing activity for electrical self-stimulation was studied in rats with chronically implanted bipolar electrodes in the lateral hypothalamic area. It could be shown that ipsilateral (with respect to side of hypothalamic stimulation) SD reduces lever pressing rates significantly more than contralateral SD. The same lateralization effect of this cortico-hypothalamic influence occurs when interference thresholds of hypothalamic stimulations during unilateral SD are compared.—*Journal abstract.*

7652. Teitelbaum, Herman, & Milner, Peter. (McGill U.) **Activity changes following partial hippocampal lesions in rats.** *J. comp. Physiol. Psychol.*, 1963, 56(2), 284-289.—Rats with hippocampal lesions were found to be more active than normal and brain damaged controls. This hyperactivity was manifested in a greater number of light-beam interruptions in an activity cage and in increased running speed in an unbaited T maze. When placed in a situation involving inhibition of movement, Ss with hippocampal lesions were unable to inhibit movement to avoid shock. (15 ref.)—*Journal abstract.*

7653. Stamm, J. S., & Knight, Marcia. (Queens Coll., Flushing, N. Y.) **Learning of visual tasks by monkeys with epileptogenic implants in temporal cortex.** *J. comp. Physiol. Psychol.*, 1963, 56(2), 254-260.—Alumina cream was implanted bilaterally in monkeys, either on anterior medial temporal cortex (AMT) or on inferotemporal cortex (IT). Normal controls and 2 epileptic groups were tested after onset of epileptic discharges. IT group was greatly impaired on the 1st 2 of 8 simultaneous visual discriminations and on 1st stimulus reversal, but overcame

their deficits on succeeding discrimination and reversal problems. AMT group was only slightly poorer than normals on first discrimination and reversal tasks but showed little improvement in acquisition of succeeding problems. It is concluded that IT cortex is implicated in searching behavior on visual tasks, whereas AMT cortex (amygdaloid structures) is implicated in the solution of tasks which require utilization of previous experiences.—*Journal abstract.*

7654. Thompson, Robert. (U. California Medical Cent., Los Angeles) **Thalamic structures critical for retention of an avoidance conditioned response in rats.** *J. comp. physiol. Psychol.*, 1963, 56(2), 261-267.—This study was designed to determine by the lesion method which thalamic nuclei are critical in the maintenance of an avoidance conditioned response. After being trained to make a jumping response to the onset of a tone or light, 62 rats were subjected to bilateral electrolytic lesions in various parts of the thalamus. Retention scores revealed that damage to either the diffuse thalamic nuclei or the dorsomedial nucleus significantly impaired postoperative performance of both visual and auditory habits. Similar effects were obtained following anterior cortical ablation. Lesions confined to the medial prefrontal diencephalon (nucleus posterior thalami) interfered with the visual task only. (24 ref.)—*Journal abstract.*

7655. Warren, J. M., Grant, R., Hara, K., Leary, R. W. (Pennsylvania State U.) **Impaired learning by monkeys with unilateral lesions in association cortex.** *J. comp. physiol. Psychol.*, 1963, 56(2), 241-253.—Comparison of 10 experimentally naive rhesus monkeys with unilateral lesions in association cortex with 4 normal controls on 10 learning experiments during 20 mo. of postoperative testing indicated that unilateral preparations: (a) were significantly retarded in initial learning, but not in final level of proficiency, on a series of discriminations between objects differing in external contour; (b) formed oddity and conditional discrimination learning sets and learned a conditional oddity problem as rapidly as controls; (c) made significantly more errors on 6 different sets of pattern discrimination problems; (d) made an increased number of errors on object discrimination and reversal problems when intercurrently tested on pattern discrimination tasks, although controls were unaffected. (e) Ss with frontal or temporal lesions were hyperactive or "tame," respectively. (25 ref.)—*Journal abstract.*

7656. Weiskrantz, Lawrence, & Cowey, Alan. (U. Cambridge) **Striate cortex lesions and visual acuity of the rhesus monkey.** *J. comp. physiol. Psychol.*, 1963, 56(2), 225-231.—Visual acuity was measured pre- and postoperatively in monkeys given resections of striate or inferotemporal cortex. Striate Ss showed decreases in acuity, the severity of which corresponded reasonably well with the completeness and location of the lesions. Temporal Ss showed no decrease. The drop in acuity shown by the striate Ss was less than would be predicted if the lesion produced an absolute scotoma and if the relation between foveal and parafoveal acuity is the same in monkey as in man. (24 ref.)—*Journal abstract.*

7657. Wilson, William A., Jr., Oscar, Marlene, & Gleitman, Henry. (Bryn Mawr Coll.) **The effect of frontal lesions in monkeys upon widely-spaced delayed-response trials.** *J. comp. physiol. Psychol.*, 1963, 56(2), 237-240.—Monkeys that previously had been highly trained on delayed response (DR) were tested before and after frontal operations on 5-sec., direct-method DR trials given at the rate of 1 per day. Normal animals performed essentially perfectly; frontal operatees showed the classical deficit. Ss of both groups tended to adopt a position on the correct side of the cage immediately after baiting. Explanations of frontal DR deficit as due to (a) an unusual difficulty in overcoming the strongest response tendency present, (b) an extreme sensitivity to the deleterious effect of massing of trials, or (c) an inability to adopt a position which can serve to "bridge the delay gap," would all appear to be unable to assimilate these data.—*Journal abstract.*

BRAIN STIMULATION

Central Stimulation

7658. Chocholova, L. (Inst. Physiology, Czechoslovak Acad. Science, Prague) **The role of the cerebral cortex in audiogenic seizures in the rat.** *Physiol. bohemoslov.*, 1962, 11(5), 452-457.—A study was made of the effect of functional elimination of the cerebral cortex by spreading cortical depression (induced by the application of 25% KCl solution to the cerebral cortex) on the elicitation and symptomatology of audiogenic epileptic seizures in the rat. The following conclusions were reached: (a) An active state of the cerebral cortex facilitates the elicitation of seizures in susceptible rats and increases their severity. (b) The elimination of the cerebral cortex lowers the inducibility of seizures relatively less in highly susceptible rats than in less susceptible animals, but does not inhibit them completely in either group. (c) The reaction of non-susceptible rats to an epileptogenic stimulus does not change after spreading depression. (d) All the main types of seizure are observed after functional eliminating of the cortex, including seizures with an inhibition interval.—*Journal summary.*

7659. Fleming, Donovan E. (U. Utah Coll. Medicine) **Response arrest associated with the corticifugal projection of chemically induced local seizure discharge.** *EEG clin. Neurophysiol.*, 1963, 15, 84-90.—A learned flexion response in 9 cats was utilized to assess the effect of the downstream projection of local seizure discharge from the somatosensory auditory and visual areas on performance. The cats were trained to flex the right hindleg to a 6 sec. click conditioning stimulus partially reinforced with a shock to the same leg. Subcortical (left mesencephalic reticular formation, left centre median, right zona incerta, and right hippocampus) and cortical electrodes were used. Acetylcholine chloride was used to induce seizure discharges. Those discharges associated with the corticifugal projection of impulses to the subcortical reticular system produced a behavioral arrest in which the flexion CR was abolished. In the absence of corticifugal projection of impulses the flexion response was not affected. Conditioned respiratory responses were unaffected by the projection of seizure discharge to the subcortex.—*J. C. Johnson.*

7660. Grossman, S. P. (Yale U.) **Direct adrenergic and cholinergic stimulation of hypothalamic mechanisms.** *Amer. J. Physiol.*, 1962, 202(5), 872-882.—Double-walled cannulas were im-

planted stereotaxically in the hypothalamus of 36 rats, allowing repeated stimulation of the same site in an area between the fornix and mamillo-thalamic tract, lateral and dorsal to the ventromedial nuclei. Minute amounts of adrenergic substances induced vigorous and prolonged eating, and comparable amounts of cholinergic substances induced vigorous and prolonged drinking in satiated rats. Adrenergic stimulation increased food intake of hungry rats but decreased water intake of thirsty rats. Cholinergic stimulation increased water intake but decreased food intake.—*D. R. Peryam.*

7661. Justesen, R., Sharp, Joseph C., & Porter, Paul B. (U. Utah) Self-stimulation of the caudate nucleus by instrumentally naive cats. *J. comp. physiol. Psychol.*, 1963, 56(2), 371-374.—Es previously reporting electrical self-stimulation of the brain (ESB) by cats have invariably pretrained their Ss on food-reinforced schedules. To avoid possible confounding of ESB by food-reinforced habits, we attempted and were able to produce ESB of the caudate nucleus (via chronic, indwelling electrodes) in hitherto untrained cats. However, even though continuous schedules of ($\frac{1}{2}$ -sec. trans at 50 cps) pulse-pair stimulation reliably increased responding of 7 Ss above operant levels, there was: (a) marked uniformity of ESB rate (i.e., typical acquisition and extinction "curves" were not observed); (b) no discernible resistance to extinction; and (c) very high correlations among operant, reinforced, and extinction measures. Rather than "rewarding," the caudate stimulus appeared to produce generalized motor activation and, hence, a nonspecific acceleration of the operant.—*Journal abstract.*

Electroshock

ELECTROENCEPHALOGRAPHY

7662. Lairy, G. C. Le concept de normalité en électroencéphalographie. [The concept of normality in electroencephalography.] *J. Psychol. norm. pathol.*, 1961, 4, 445-459.—The author discusses the inherent ambiguities of the concept of normality. In clinical usage normal may mean absence of disturbance, correspondence with an ideal type, or near the mean of a statistical distribution. With respect to EEG, normal may mean a record without morphological abnormality or it may mean the tracing obtained from a healthy S. Criteria of both are discussed. (24 ref.)—*M. L. Simmel.*

7663. Mikhalevskaia, M. B. (Moscow U., USSR) O zavisimosti fazicheskikh i tonicheskikh orientirovochnykh reaktsii ot uslovii afferentatsii. [Phasic and tonic orienting reactions as functions of stimulation.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1962, No. 3, 103-106.—10 Ss had their EEG recorded under conditions of opening their eyes in complete darkness, and of fixating a weak red light. The changes which were noticed warrant the conclusion that "the activation of the orienting reflex manifests itself in the human EEG in a depression of the alpha waves." The amount of activation depends upon the conditions of the visual stimulation.—*A. Cuk.*

7664. Surwillo, Walter W. (National Inst. Health, Bethesda, Md.) The relation of simple response time to brain-wave frequency and the effects of age. *EEG clin. Neurophysiol.*, 1963, 15, 105-114.—

100 Males ranging in age from 28-99 yr. were examined to verify a previously reported relationship of brain wave cycle to reaction time. Age as a variable in the EEG reaction time relationship was also investigated. Correlation of average period of the EEG between onset of stimulus and response with reaction time was .72. Age was not a factor in this relationship, but a highly significant positive correlation was found between age and average brain wave period. The data was viewed as supportive of the hypothesis that the brain-wave cycle is the basic unit of time in terms of which a response is programed by the CNS. *L. C. Johnson.*

7665. Zubek, John P., & Welch, G. (U. Manitoba, Winnipeg, Canada) Electroencephalographic changes after prolonged sensory and perceptual deprivation. *Science*, 1963, 139(Whole No. 3560), 1209-1210.—7 days' exposure to unpatterned light and white noise produced a significantly greater decrease in occipital lobe frequencies than did the same period of darkness and silence. This differential effect may be related to the greater behavioral impairments which seem to occur after prolonged exposure to diffuse light and noise.—*Journal abstract.*

EVOKED POTENTIALS

7666. Goldring, Sidney; Anthony, Lyndon U., Stohr, Paul E., & O'Leary, James L. (Washington U. School Medicine, St. Louis, Mo.) "Caudate-induced" cortical potentials: Comparison between monkey and cat. *Science*, 1963, 139(Whole No. 3556), 772.—The segment of the internal capsule which carries axons relating to the sensorimotor cortex does not closely adjoin the caudate in the monkey as it does in the cat. Therefore, in seeking evidence for caudate-induced cortical responses, activation of the adjoining internal capsule by stimulus spread can be avoided. In the monkey, caudate stimulation never produced cortical responses, and only capsule stimulation evoked the potential complex which has been attributed to caudate stimulation in the cat.—*Journal abstract.*

7667. Ogawa, Tetsuro. (U. Sydney, Australia) Midbrain reticular influences upon single neurons in lateral geniculate nucleus. *Science*, 1963, 139(Whole No. 3552), 343-344.—The effect of electrical stimulation of the midbrain reticular formation upon patterns of discharge of single lateral geniculate neurons was studied. Data were processed by means of a 256-channel scaler analyzer. The rate of spontaneous discharge of geniculate neurons was raised by electrical stimulation of the reticular formation and their ability to respond to intermittent light was enhanced.—*Journal abstract.*

SENSORY PHYSIOLOGY

7668. Bianconi, R., & Van Der Meulen, J. P. (Nobel Inst., Stockholm, Sweden) The response to vibration of mammalian muscle spindles. *J. Neurophysiol.*, 1963, 26(1), 177-190.—Spindle end-organ responses were recorded in cat gastrocnemius and soleus muscles while applying vibration or single pulls to the muscles. End organs which responded to vibratory stimulation generally had afferents with high conduction velocities. End organs with high conduction velocity afferents have a high degree of slowing of discharge rate, when the static phase is

compared with the dynamic phase on application of a rapid stretch that is then maintained. Possible anatomical correlatives of these findings are discussed.—G. Westheimer.

7669. Dickens, W. M., & Winkelmann, R. K., & Mulder, D. W. [Mayo Clinic & Mayo Found., Rochester, Minn.] Cholinesterase demonstration of dermal nerve endings in patients with impaired sensation. *Neurology*, 1963, 13(2), 91-100.—A histochemical investigation of cholinesterase enzymes in cutaneous nerve endings in 41 patients with sensory loss including palms and soles. The study included some patients whose sensory loss was of central origin and a control group of 37 Ss with normal sensation. The authors found that the number of Meissner corpuscles reacting to cholinesterase is a measure of peripheral nerve function. Cholinesterase reactivity in these corpuscles was absent in many patients with severe peripheral neural lesions but was found to be uniformly present in patients with lesions of the central nervous system. Using only small samples of skin, the authors found a correlation between decrease in numbers of Meissner corpuscles and advancing age.—R. Gunter.

7670. Huizinga, Eelco. (Groningen, Netherlands) On the microphonic effect of the crista. *Acta oto-laryngol.*, Stockholm, 1962, 55(4), 283-291.—The microphonics of the cochlea and of the crista are important for 3 reasons. (a) They demonstrate that by the stimulation with sound the various parts of the labyrinth vibrate. (b) By the parallelism between the voltage of the microphonics and the excitability of the organ of Corti and the crista. (c) They can give a better insight into the problem of transformation of the mechanical energy into electric energy by the inner ear. With regard to (c), there is a discussion of the hair hypothesis of de Vries. Kuiper demonstrated that this hypothesis is not right, as the facts cannot be explained by the pulling at the hairs. But 2 important facts remain and require explanation: the double frequency of the lateral line organ in the fish and the superposition effect. This phenomenon in the pigeon is discussed. It occurs when a low and a high frequency component are presented together to the ear.—Journal abstract.

7671. Jacobs, Gerald H., Jones, Arthur E., & De Valois, Russell L. (Indiana U.) Electroretinogram of the squirrel monkey. *J. comp. physiol. Psychol.*, 1963, 56(2), 405-409.—Electroretinograms (ERG) were recorded from 8 squirrel monkeys in response to single light pulses and flickering monochromatic light. Spectral sensitivity curves were obtained from both stimulus conditions. It was found that: (a) the waveform of the ERG exhibits many of the characteristics of the human ERG including x-waves; (b) there is clear evidence for differential scotopic-photopic function as found in the form of a Purkinje shift; (c) the scotopic function has a form similar to that of the human scotopic function with the expected ERG elevation at the short wave length end; (d) the photopic function, although having a peak sensitivity similar to that of the normal human photopic ERG, is much narrower with a sharp drop on both the short and long wave length ends of the spectrum.—Journal abstract.

7672. Kelemen, George. (Harvard Medical School) The 4000-dip: Anatomic considerations.

Acta oto-laryngol., Stockholm, 1962, 55(4), 365-376.—In a number of sectional series of temporal bones of malformed fetuses and newborn, the enchondral layer of the cochlear capsule was found to perforate, in a broad stream, the periosteal layer and to meet beyond the latter the so-called cartilage (chondral) bar. This 3rd interruption of the capsular layers—the 1st and 2nd being the internal acoustic meatus and the cochlear aqueduct—is located in the basal cochlear turn corresponding to the 4000 dip of the audiometric curve. Lack of shielding by the periosteal layer, combined with the disturbance of the enchondral layer caused by the abrupt change of direction, may create here an area of diminished protection for the underlying membranous parts. This interpretation, based on observations in the osseous capsule, is offered as a counterpart to the explanatory attempts regarding the 4000-dip, which consider happenings in the membranous portions exclusively. Investigation of this "enchondral outflow" in normals of different ages is desirable.—Journal abstract.

7673. Money, Kenneth E., & Scott, John W. (U. Toronto, Canada) Functions of separate sensory receptors of nonauditory labyrinth of the cat. *Amer. J. Physiol.*, 1962, 202(6), 1211-1220.—Plugging of individual semicircular canals completely blocked receptivity without influencing functions of other vestibular receptors. Cats with all 6 canals plugged lost all sensitivity to angular acceleration, but retained normal responses to linear acceleration. Results indicated that vertical canals initiate corrections for fast, and otoliths for slow, angular displacements about horizontal axes. It was also concluded that both horizontal canals contribute equally to reception of angular acceleration in both directions.—D. R. Peryam.

7674. Perlman, H. B., & Kimura, R. (U. Chicago) Cochlear blood flow in acoustic trauma. *Acta oto-laryngol.*, Stockholm, 1962, 54(2), 99-110.—Some normal values of cochlear blood flow rate, cochlear function (microphonic response to 277 cycles at 90 db.), carotid pulse pressure, and heart rate are presented along with changes due to excessive acoustic stimulation. The relation of cochlear blood flow to the oxygen demands of the cochlea is considered.—Journal abstract.

7675. Ruben, R. J., Hudson, W., & Chiong, A. (Johns Hopkins Hosp., Baltimore, Md.) Anatomical and physiological effects of chronic section of the eighth nerve in cat. *Acta oto-laryngol.*, Stockholm, 1962, 55(5-6), 473-484.—Section of the 8th nerve caused a degeneration of the unmyelinated fibers in the tunnel of Corti followed by loss of the ganglion cells in the modiolus and degeneration of the 8th nerve. 2 days after section of the 8th nerve the N_2 was found to disappear. 3 days after section of the eighth nerve the N_1 was found to disappear. After the N_1 and N_2 disappeared a new neural like potential called the W phenomenon was observed. The degeneration of the unmyelinated fibers was associated with the disappearance of the N_1 and N_2 .—Journal abstract.

7676. Simmons, F. Blair. (Stanford U.) Simultaneous transtympanic and electrophysiological indices of the acoustic reflex activity in the cat. *Acta oto-laryngol.*, Stockholm, 1962, 55(4), 309-314.—The middle ear muscle contractions of the awake

cat were monitored simultaneously by changes in cochlear microphonic response and changes in the output of a microphone sealed, along with a carrier-tone source, in the animal's ear canal. A comparison of the 2 methods showed the cochlear microphonic attenuation caused by muscle contraction to be more sensitive, but the difference was often only 10-15 db, for stimulus/carrier frequencies between about 1.2 and 2.5 kc. This observation is taken as evidence that the difference in sensitivity of the acoustic reflex of man and cat is not primarily due to differences in the sensitivity of the measurement method employed.—*Journal abstract.*

7677. Weiss, Howard S., Mundie, Joseph R., Jr., Cashin, John L., & Shinabarger, Edward W. (Aerospace Medical Research Lab., Wright-Patterson AFB, O.) The normal human intra-aural muscle reflex in response to sound. *Acta otolaryngol., Stockholm*, 1962, 55(5-6), 505-515.—The particular modification of the method of tympanometry as it is employed in our laboratory has proven to be a useful tool in the investigation of the normal human intra-aural muscle reflex. Some of the signal-response relationships of this reflex have been investigated and discussed. Evidence was presented which supports the thesis that both the stapedius and tensor tympany muscles in the human respond to sound stimuli. The suggestion is made that this technique lends itself to increasing the accuracy of preoperative diagnosis of some forms of conductive hearing loss.—*Journal abstract.*

7678. Wersäll, Jan, & Hawkins, Joseph E., Jr. (Karolinska Inst., Stockholm, Sweden) The vestibular sensory epithelia in the cat labyrinth and their reactions in chronic streptomycin intoxication. *Acta oto-laryngol., Stockholm*, 1962, 64(1), 1-23.—The effect of streptomycin on the sensory epithelia of labyrinth in cats was studied by means of electronystagmography, light microscopy, phase contrast microscopy, and electron microscopy. Severe damage was noted for all treated animals, but differential sensitivity for different types of hair cells was observed and attributed to differences in function and metabolic activity. It is suggested that streptomycin is secreted through the secretory cells in the cristae and has a local effect on the sensory epithelia. There is a good correlation between disturbance of the equilibration mechanism and damage in the epithelia of the peripheral sensory apparatus, suggesting that the effect of streptomycin in cats is mainly if not exclusively peripheral.—*M. Loeb.*

7679. Zwislocki, J., & Feldman, A. S. (Syracuse U.) Postmortem acoustic impedance of human ears. *J. Acoust. Soc. Amer.*, 1963, 35(1), 104-107.—By means of a portable acoustic bridge, it is possible to measure the acoustic impedance at the eardrum of fresh human cadavers. Comparison with the acoustic impedance determined by the same method and with the same instrumentation on live Ss shows that the impedance increases considerably after death. Consequently, results obtained on cadaver ears cannot be applied directly to the middle-ear function during life.—*A. M. Small, Jr.*

ENDOCRINE, BIOCHEMICAL, & CIRCULATORY EFFECTS

7680. Adams, Thomas. (U. Washington School Medicine, Seattle) Hypothalamic temperature in

the cat during feeding and sleep. *Science*, 1963, 139(Whole No. 3555), 609-610.—Anterior hypothalamic temperature is reported for the unanesthetized cat resting at an air temperature of 22° to 25° C. during the ingestion of cold or warm liquids, and during sleep. Drinking cold (5° C.) milk resulted in an immediate depression of hypothalamic temperature and a period of peripheral vasodilation in the ear and forepaw foot and toe pads, followed by a drop in rectal temperature. Drinking warm (body temperature) milk did not bring about these changes. Hypothalamic temperature during sleep is lower by approximately 0.5° C. and is characterized by widely varying, slow-frequency oscillations, compared to the higher, more precisely controlled temperature seen when the animal is awake.—*Journal abstract.*

7681. Ader, R., Kreutnew, A., & Jacobs, H. L. (U. Rochester School Medicine) Social environment, emotionality, and alloxan diabetes in the rat. *Psychosom. Med.*, 1963, 25(1), 60-68.—43 albino rats were raised individually and 45 were raised in groups. Then equal numbers of each group, matched for emotionality, were caged individually or in groups. It was found that: (a) Ss raised in groups were less emotional; (b) level of emotionality was not related to the degree of hyperglycemia in response to alloxan; and (c) irrespective of rearing, animals living in groups when given alloxan showed higher blood sugar. (21 ref.)—*W. G. Shipman.*

7682. Block, Jack. (U. California, Berkeley) Measurement dimensions in a palmar resistance situation. *Psychol. Rep.*, 1962, 11(2), 319-331.—"As an empirical means of establishing the primary measurement dimensions . . . 22 skin resistance measures taken during a complex psychological situation (a film) were factor analyzed. Seven orthogonal dimensions, which subsumed almost all the significant variance, were extracted. The seven factors were labelled, tentatively, as General Resistance Level, Reactivity To The Film, Involvement In The Film, Phlegmatism, Resistance Peak When Uninvolved, Spontaneous GSRs, and Lowest Resistance Reached At Any Time. . . . The factor dimensions found appear to have some general applicability and have already received some cross-validation. Accordingly, researchers employing the palmar resistance technique may find useful the measures here proposed as relatively pure factorial indices."—*B. J. House.*

7683. Carlton, Peter L. (Squibb Inst. Medical Research) Cholinergic mechanisms in the control of behavior by the brain. *Psychol. Rev.*, 1963, 70(1), 19-39.—Several experiments indicated that a cholinergic system in the brain antagonizes a 2nd system, which activates behavior. Neuropharmacological considerations suggested certain drugs with which the activity of these systems could be altered. These experiments indicated that the cholinergic system acts selectively by preferentially antagonizing the effects of activation on unrewarded behavior. That is, there appears to be a cholinergic involvement in the mediation of the effects of nonreward. Although such interpretations are necessarily very tentative, there are inferential grounds for supposing that a cholinergic system selectively antagonizes the effect of activation on certain behavior and that the basis of this selectivity is the extent to which that behavior is unrewarded. (65 ref.)—*Journal abstract.*

7684. Coleman, P., & Havlena, Joan. (Lafayette Clinic, Detroit, Mich.) **Maze learning and open field behavior of adrenalectomized rats.** *J. psychosom. Res.*, 1962, 6(3), 153-156.—5 adrenalectomized rats did not differ from 5 sham operated and 5 normal control rats in total body weight, water intake, or ambulation (25 days post-op) in an open field. In a 4 unit T maze, however, controls made more early learning errors. Later in maze learning the groups did an equal number of errors, but the controls ran quicker than the adrenalectomized animals.—*W. G. Shipman.*

7685. Docter, R. F., Kaswan, J. W., & Nakamura, C. Y. (U. California, Los Angeles) **The reliability and distribution of spontaneous heart rate changes in humans.** *J. psychosom. Res.*, 1962, 6(4), 217-221.—Reliability of heart rate measures was studied in 84 college men over successive days and months. 1 week retest correlations ranged from .14 to .72. The maximum 1 month retest correlation was .35. Basal heart rate was not related to any heart rate fluctuation score used.—*W. G. Shipman.*

7686. Doehring, D. G., Ferster, C. B. (Indiana U. Medical Cent.) **Psychophysiological responses in a human operant situation.** *Psychol. Rec.*, 1962, 12(3), 251-261.—Heart rate, GSR, and blink rate were measured under a mixed schedule of reinforcement: FR20 V14 and DRL. In 1 experiment ($N=2$) effects of work no work to obtain reinforcement stimuli were compared. In the 2nd experiment ($N=1$) all sessions were work. In addition, for some sessions electric shock was given on a fixed ratio schedule. "The reinforcing stimuli produced consistent decreases in blink rate throughout all operant sessions except those where electric shock was given. The pattern of change in heart rate varied among S's."—*R. J. Seidel.*

7687. Dykman, R. A., Ackerman, Peggy T., Galbrecht, C. R., & Reese, W. G. **Physiological reactivity to different stressors and methods of evaluation.** *Psychosom. Med.*, 1963, 25(1), 37-59.—20 medical students were subjected to 2 stresses (task) one year apart. Skin-resistance, heart-rate, respiratory-rate, and forearm muscle potential were recorded. Most important determinants of physiological reactivity were found to be: level of functioning at the time a stimulus is presented, severity of the stress, response consistency, and group consistency. A new method of scaling autonomic responses is outlined. (42 ref.)—*W. G. Shipman.*

7688. Essman, Walter B., & Sudak, Frederick N. (Albert Einstein Coll. Medicine) **Effect of hypothermia on the establishment of a conditioned avoidance response in mice.** *J. comp. physiol. Psychol.*, 1963, 56(2), 366-369.—In 2 experiments investigating effect of moderate hypothermia on establishment of conditioned avoidance responses, and upon response to electric shock, an average reduction of body temperature by 2.8° C. was capable of impairing acquisition. Escape from electric shock was unimpaired at a greater degree of hypothermia than was required for impairment of acquisition. It was concluded that: (a) responses reinforced with a single punishing shock were not conditioned in hypothermic mice, whereas normothermic mice demonstrated conditioning under identical training conditions; (b) an escape response to 3.8 ma. shock remains unaffected

at colonic temperatures reduced by as much as 9.3° C.; (c) minimal hypothermia (2.8° C.) may interfere with acquisition of a response rather than retention of a response presumably acquired under hypothermia.—*Journal abstract.*

7689. Forsander, O., & Salaspuro, M. (Research Lab. State Alcohol Monopoly (Alko), Helsinki, Finland) **Voluntary ethanol consumption as related to ketone bodies metabolism in rats.** *Life Sci.*, 1962, No. 9, 467-470.—The preference for ethanol in self-selection experiments and the degree of ketonuria after oral administration of n-butyrate has been studied in male and female laboratory rats. A negative correlation exists between the ethanol consumption of the rats and the degree of ketonuria produced by butyrate administration.—*Journal abstract.*

7690. Fox, R. H., & Wyatt, H. T. (National Inst. Medical Research, London, England) **Cold-induced vasodilation in various areas of the body surface of man.** *J. Physiol., London*, 1962, 162(2), 289-297.—The distribution of the vasodilation phenomenon was tested at 34 body-surface sites on 3 male Ss. Areas 3 cm in diameter were cooled for 30 min. Responses were elicited from all areas previously known to respond and from many other areas. The distribution of responses accords well with the classic theory that the phenomenon is found in areas of the body likely to be exposed to severe local cooling.—*D. R. Peryam.*

7691. Fox, R. H., Goldsmith, R., & Kidd, D. J. (National Inst. Medical Research, London, England) **Cutaneous vasomotor control in the human head, neck and upper chest.** *J. Physiol., London*, 1962, 161(2), 298-312.—Surface calorimeters were used to monitor responses to cutaneous nerve block and the effects of vasodilator stimuli. Responses to inhalation of amyl nitrite and gustatory stimuli were examined. It was concluded that dilation of the ear, lip, and nose is mainly the result of the release of vasoconstrictor tone; but some vasodilation occurs in the nose in response to thermal and gustatory stimuli. Vasoconstrictor tone is relatively unimportant in controlling skin circulation in the scalp, forehead, chin, sub-mandibular area, neck, and upper chest.—*D. R. Peryam.*

7692. Gladstone, Roy. (Oklahoma State U.) **The effect of temperature upon palmar sweat.** *J. gen. Psychol.*, 1962, 67(2), 183-197.—Graphs of the relation between finger temperature and palmar sweat are presented. The graphs were plotted from data secured by repeated measurement of the variables when ambient temperature was varied. 5 groups were used. The conditions under which the ambient temperature was varied were emotionally serene but otherwise somewhat different in each group. Nevertheless the curves were similar in shape. It is concluded that palmar sweat increases gradually from a finger temperature of 65° to 85° F., increases more rapidly to 93° F., and probably decreases rapidly at higher temperatures. The curves can be used to correct palmar sweat data for the effect of changes in temperature, when such changes introduce an error in experimental data.—*Author abstract.*

7693. Grossman, Sebastian P. (Yale U.) **Effects of adrenergic and cholinergic blocking agents on hypothalamic mechanisms.** *Amer. J. Physiol.*, 1962, 202(6), 1230-1236.—Placement of minute

amounts of norepinephrine into an area between the fornix and mammillothalamic tract produced eating in food-satiated rats, and placement of acetylcholine or carbachol in identical loci caused drinking in water-satiated rats. Evidence for the neurohumoral nature of these effects is reported. Results suggest the presence of 2 populations of neural elements which are differentially sensitive to the 2 kinds of drugs.—D. R. Peryam.

7694. Handlon, J. H., Wadson, R. W., Fishman, J. R., Sachar, E. J., Hamburg, D. A., & Mason, J. W. (National Inst. Mental Health, Bethesda, Md.) **Psychological factors lowering plasma 17-hydroxycorticosteroid concentration.** *Psychosom. Med.*, 1962, 24(6), 535-542.—Using 19 normal young adult male Ss viewing Disney nature-study films, it was discovered that the levels of plasma 17-AHCS were lowered to a significant degree in comparison to: a control period when no films were shown, and a showing of emotionally arousing films. They conclude "that the CNS regulation of adrenocortical function involves lowering as well as raising plasma 17-OHCS concentrations."—W. G. Shipman.

7695. Johnson, Laverne C., & Corah, Norman L. (USN Medical Neuropsychiatric Research Unit, San Diego, Calif.) **Racial differences in skin resistance.** *Science*, 1963, 139(Whole No. 3556), 766-767.—In 2 laboratories utilizing different age Ss and recording techniques, Negro Ss had higher skin resistance than a comparable white population. There was no difference in other autonomic variables or autonomic reactivity. Reasons for this racial difference may offer a better physiological explanation for galvanic skin resistance.—*Journal abstract.*

7696. Johnson, Laverne C. (USN Neuropsychiatric Research Unit, San Diego) **Some attributes of spontaneous autonomic activity.** *J. comp. physiol. Psychol.*, 1963, 56(2), 415-422.—65 Naval helicopter pilots were examined to determine the stability and correlates of spontaneous autonomic activity, the effect of stimulation on spontaneous responses and the possible use of spontaneous activity as a measure of general autonomic lability. Over a 48-hr. period spontaneous GSR was found to be moderately stable ($\rho = .69$) but spontaneous heart rate (HR) was less reliable ($\rho = .36$). Spontaneous HR and GSR were independent of each other and neither was consistently related to EEG measures, heart rate, basal conductance, skin temperature, respiration, or blood pressure. Spontaneous activity during a resting period was related to that found during stimulation. For spontaneous GSR there was an initial increase in activity to each stimulus but rapid adaptation occurred to repetitive presentations. Spontaneous HR showed no change during stimulation. Ss with a large number of spontaneous responses, especially GSR, showed more reactivity to initial stimuli and less adaptation to repetitive stimuli than Ss with few spontaneous responses.—*Journal abstract.*

7697. Kleber, Ronald J., Lhamon, William T., & Goldstone, Sanford. (Baylor U. Coll. Medicine) **Hyperthermia, hyperthyroidism, and time judgment.** *J. comp. physiol. Psychol.*, 1963, 56(2), 362-365.—Ss with hyperthyroidism and Ss with raised body temperature judged auditory inputs in relation to their concept of a clock second. Both organismic

states resulted in an overestimation of the auditory durations, providing shorter inputs for temporal conceptual equivalence. The findings were predicted with reference to a model of the organism as an event-producing and counting clock, and the results conformed to previous work on time judgment and drugs and temperature.—*Journal abstract.*

7698. Lazarus, R. S., Speisman, J. C., & Mordkoff, A. M. (U. California, Berkeley) **The relationship between autonomic indicators of psychological stress: Heart rate and skin conductance.** *Psychosom. Med.*, 1963, 25(1), 19-30.—Correlations between autonomic nervous system indices of arousal have been small. This has resulted from the error of correlating across Ss. When intraindividual approaches were used on heart rate and skin conductance data obtained during benign and stressor films, correlations up to .5 were obtained. "Thus there is evidence of a generalized autonomic reaction when the appropriate methods of correlation are used." (18 ref.)—W. G. Shipman.

7699. Mandell, Arnold J., Chapman, Loring F., Rand, Robert W., & Walter, Richard D. (U. California, Los Angeles) **Plasma corticosteroids: Changes in concentration after stimulation of hippocampus and amygdala.** *Science*, 1963, 139(Whole No. 3560), 1212-1213.—Plasma 17-OH corticosteroid levels were determined before stimulation and at various intervals after stimulation in these limbic sites in patients in whom implanted electrodes had been placed during evaluation for surgical treatment of psychomotor epilepsy. Stimulation of the amygdala was followed by an elevation of plasma 17-hydroxycorticosteroids. Hippocampal stimulation resulted in a decreased corticosteroid level, followed in 2 instances by a secondary elevation.—*Journal abstract.*

7700. Meier, Gilbert W. (Lab. Perinatal Physiology, San Juan, P. R.) **Suppression of activity following physiological saline injection: Still more variables.** *Psychol. Rep.*, 1962, 11(2), 333-334.—"The suppressive effects of injections of physiological saline solutions upon activity, reported by Schnitzer and Ross, has been confirmed in another mouse strain with a much-simplified apparatus. The ionic balance and the relative volume of the injection are implicated as key variables."—B. J. House.

7701. Pare, W. (Boston Coll.) **The effect of conflict and shock stress on stomach ulceration in the rat.** *J. psychosom. Res.*, 1962, 6(4), 223-225.—"Data on stomach condition and adrenal weight are presented which indicated that animals subjected to shock stress experienced a more stressful environment as compared to Ss subjected to an approach-avoidance (water-shock) conflict. Ulcers previously reported as having been developed by psychological stress may be attributed to a greater degree, to the physical stress of electrical shock."—W. G. Shipman.

7702. Pineda, Anselmo, & Snider, Ray S. (Northwestern U.) **Nonspecific depressant action of serotonin on brain stem and cerebellum.** *Neurology*, 1963, 13(2), 166-176.—Because of the role of 5-HT (5-hydroxytryptamine, serotonin) as a depressant transmitter in the CNS the authors investigated its action on evoked response at different levels of brain stem, cerebellum, and cerebrum of cats under chloralose and under flaxedil. On the basis of monopolar and bipolar recording, the authors found

"a depressant effect of serotonin on evoked potentials in cerebellum and cerebrum following peripheral nerve stimulation." The same effect was recorded from several thalamic nuclei. A prolonged delay of action or no effect was found in mesencephalic reticular formation with 10 $\mu\text{g}/\text{kg}$. Higher doses (20-40 $\mu\text{g}/\text{kg}$) resulted in death. Artificial respiration produced an initial diminution of amplitude, followed by a total reappearance of the evoked response. It is concluded that serotonin has a general nonspecific effect on the CNS.—*R. Gunter*.

7703. **Spehlmann, Rainer.** (U. Freiburg, Germany) **Acetylcholine and prostigmine electrophoresis at visual cortex neurons.** *J. Neurophysiol.*, 1963, 26(1), 127-139.—Extracellular recordings were obtained from neurons of the visual cortex in cats while acetylcholine, prostigmine, and dihydro- β -erythroidine were electrophoretically discharged from adjacent barrels of multi-barreled micropipettes. Acetylcholine increased spontaneous activity and the evoked discharges during the light-activated phase in on-neurons, during the dark-activated phase in off-neurons, and during both in on-off neurons. Prostigmine alone sometimes had an activating effect. It also enhanced the effect on Ach subsequently applied.—*G. Westheimer*.

7704. **Stern, J. A., & Word, T. J.** (Washington U. School Medicine, St. Louis) **Heart rate changes during avoidance conditioning in the male albino rat.** *J. psychosom. Res.*, 1962, 6(3), 167-175.—"Heart rate conditioning using heart rate increment following the avoidance of shock as the CR, was demonstrated in 19 animals. The conditioned anticipatory heart rate response appears early in training and is maintained throughout criterion trials. That heart rate increment following avoidance is smaller than that following escape trials casts some doubt on the hypothesis that anxiety (as measured by HR increases) is greatest during the anticipatory period."—*W. G. Shipman*.

7705. **Weiner, S., Dorman, D., Persky, H., Stach, T. W., Norton, J., & Levitt, E. E.** (Indiana U. Medical Cent., Indianapolis) **Effect on anxiety of increasing the plasma hydrocortisone level.** *Psychosom. Med.*, 1963, 25(1), 69-77.—"Hydrocortisone and a placebo were administered on separate occasions to a group of 32 normal men in a 2 \times 2, double-blind, cross-over design. The hydrocortisone did not increase the mean Affect Adjective Checklist scores but did raise the IPAT Anxiety scale scores and Sum C of the Rorschach. These findings were taken to indicate that anxiety-proneness rather than current anxiety were elevated by the administration of the hormone." (28 ref.)—*W. G. Shipman*.

7706. **Woolley, D. W., & van Der Hoeven, T.** (Rockefeller Inst., N. Y.) **Alteration in learning ability caused by changes in cerebral serotonin and catechol amines.** *Science*, 1963, 139(Whole No. 3555), 610-611.—Excess of cerebral serotonin decreased maze-learning ability of adult mice; deficiency of serotonin and catechol amines increased it slightly.—*Journal abstract*.

PSYCHOPHARMACOLOGY

7707. **Bindra, Dalbir.** (McGill U.) **Effects of several drugs on relevant and irrelevant behavior**

components in a lever-pressing situation. *Psychol. Rep.*, 1962, 11(2), 307-310.—The effects of depressants, stimulants, and hypnotics were studied in 27 male hooded rats. "All drugs produced a decrement in the frequency of lever-pressing. When the animals were equated for this decrement, different components of behavior were found to be differentially affected by the various drugs. The changes in behavior could be described along two main dimensions: motor capacity or muscular coordination and inertia or 'unwillingness' to initiate or change movements. Gallamine (Flaxedil) affected only motor capacity, methylphenidate affected (decreased) only inertia, other drugs (chlorpromazine, phenobarbital, etc.) affected both these dimensions of behavior."—*B. J. House*.

7708. **D'yuchenok, R. YU., & Nazarov, L. A.** (Inst. Experimental Biology & Medicine, Siberian Acad. Sciences, USSR) **Vzaimootnosheniye serotoninina s tsentral'nymi adreno- i kholenoreaktivnymi sistemami v mekhanizme aktivatsii elektrentsefalogram.** [Interaction of serotonin with central adrenal and cholinoreactive systems in the mechanism of EEG activation.] *Dokl. Akad. Nauk SSSR*, 1962, 146(5), 1237-1240.—Several phase changes in the EEGs of cats are observed when 200-750 μg . of serotonin creatine sulphate is injected into the lateral ventricle of the brain. At first most animals display a low amplitude high frequency wave (16-24 cps at 10-20 μv .) In 7-10 minutes the background EEG becomes intermittent. From 35-45 minutes there appears a more steady background with high frequency low amplitude waves. The "driving" response to flickering light of high frequency improves in this period. Injection of 1-1.5 mg. of serotonin into the ventricle results in a sharp decrease of amplitude without change of frequency. Gradually the amplitude suppression increases, the "driving" response deteriorates, and in 2-3 hours the EEG is suppressed. Aminazine injections seem to have little effect on the activation reaction to serotonin, but application of such central cholinolites as metamizol (0.5 mg/kg), amazil and benzoacetin (0.1 mg/kg), and atropin (w-4 mg/kg) block the activation effect of serotonin.—*H. Pick*.

7709. **Fang, H. S., Liu, H. M., & Wang, S. C.** (Columbia U.) **Liberation of antidiuretic hormone following hypothalamic stimulation in the dog.** *Amer. J. Physiol.*, 1962, 202(2), 212-216.—In 94 of 111 dogs, stimulation—not only in the supraoptic and paraventricular nuclei but also in a larger area—gave moderate to marked antidiuretic effects which lasted for 15-35 min. Atropine and d-hyoscyamine did not block the responses, but adequate amounts of n-ethyl-nortropin-benzhydrylether-hydrobromide and dibenzylidine did. Possible mechanisms are discussed.—*D. R. Peryam*.

7710. **Helper, Malcolm M., Wilcott, R. C., & Garfield, Sol L.** (Nebraska Psychiatric Inst.) **Effects of chlorpromazine on learning and related processes in emotionally disturbed children.** *J. consult. Psychol.*, 1963, 27(1), 1-9.—39 children in a psychiatric hospital were tested on 2 types of learning tasks and several performance tasks before, during, and after a 4-week period on chlorpromazine or placebo, the types of medication being assigned randomly in a double-blind design. Medication was controlled according to clinical criteria. Paired-associate

learning was less effective under chlorpromazine, especially on later learning trials and among initially slower learning Ss. Serial learning and tapping rate showed less consistent trends. Porteus Maze Mental Age scores declined under chlorpromazine, while Q scores on the same test tended to improve. No drug effect was noted on remote or immediate memory. The results were tentatively interpreted in terms of impairment of attention span by chlorpromazine.—*Journal abstract.*

7711. Kikuchi, Tetsuhiko; Kitamura, Seiro; Sato, Isao, & Oyama, Masahiro. Rorschach performance in alcoholic intoxication. Part II. *Tohoku psychol. Folia*, 1962-63, 21(1-2-3), 19-46.—Both alcoholic intoxication and the effects of retesting were measured in 2 administrations of the Rorschach. The results for intoxication were: increased M, subjective responses, new responses, W; decreased C combinations and F plus, H with non-M, F%. For repetition: increased F combinations with C, M; increased D and A; high frequency of repeated responses from preceding testing. For intoxication and repetition: increased R and decreased initial reaction time.—G. Rubin-Rabson.

7712. Meyer, Patricia M., Horel, James A., & Meyer, Donald R. (Ohio State U.) Effects of dl-amphetamine upon placing responses in neocorticate cats. *J. comp. physiol. Psychol.*, 1963, 56(2), 402-404.—6 cats with extensive lesions of the neocortex were tested for visual placing and left- and right-forepaw tactile placing responses before and after the administration of dl-amphetamine sulfate. 13 of 15 responses that had not returned after many months of postoperative recovery appeared and subsequently disappeared after drug injection.—*Journal abstract.*

7713. Nagatsuka, Yasuhiro, & Maruyama, Kinya. Effects of alcohol upon speed anticipation reaction test and discriminative reaction test of multiple performance type. *Tohoku psychol. Folia*, 1962-63, 21(1-2-3), 47-53.—The control function of consciousness was reduced and the reaction performance was retarded (delay and unevenness of reaction) by alcohol.—G. Rubin-Rabson.

7714. Nichols, John R., & Evans, Wayne O. The relationship between the analgetic effect of morphine and addiction liability in rats. *USA Med. Res. Lab. Rep.*, 1963, No. 559. ii, 8 p.—Rats, from specially developed strains of addiction-prone and addiction-resistant animals, were tested to determine their sensitivity to the analgesic effect of morphine. The "jump-flinch" analgesimetric method was used. Each animal was tested under 5 different dose levels of morphine, as well as with the vehicle as a placebo control. A difference in sensitivity to morphine was shown by both the dose-response slopes and the mean electric shock threshold values. The animals from the addiction-prone strain profited most from the morphine in terms of its analgetic activity.—*USA MRL.*

7715. Sato, Isao; Oyama, Masahiro; Kitamura, Seiro, & Kikuchi, Tetsuhiko. Rorschach performance under Ravona dosage. Part I. *Tohoku psychol. Folia*, 1962-63, 21(1-2-3), 1-17.—15 students were administered pentobarbital calcium and 7 of these a galvanometric test as well. Rorschach results under these conditions differed from normal results

as follows: level of excitement of the autonomic nervous system tends to decline; in poorly producing Ss, R increases and initial time reaction is reduced; C combinations decrease; C responses increase, as does R to the last 3 cards; and A responses decrease.—G. Rubin-Rabson.

7716. Savage, R. D. (U. New England, Australia) The effect of reserpine on conditioned fear responses. *Brit. J. Psychol.*, 1962, 53(4), 451-454.—The effect of various amounts of the drug reserpine, a derivative of rauwolfia, were investigated in relation to foreleg flexion and ambulation responses in goats subjected to electric shock stimulation. Measures revealed that as the drug dosage increased the flexion scores increased and the ambulation decreased. In the control group, without the drug, the number of flexions and ambulation scores was maximal. The findings are interpreted in terms of the possible sites of action of the drug.—*Journal abstract.*

7717. Wagner, Allan R. (Yale U.) Sodium amytal and partially reinforced runway performance. *J. exp. Psychol.*, 1963, 65(5), 474-477.—Acquisition performance of rats in a simple runway was investigated as a function of percentage reinforced trials (100% vs. 50%) and injection solution received prior to daily training (sodium amytal vs. isotonic saline) in a 2 x 2 factorial design. The results obtained from 4 groups of 12 Ss showed 50% reinforcement to lead to faster final speeds than 100% reinforcement with saline control injections; whereas this order was reversed under training with sodium amytal. The results were predicted from a frustration theory interpretation of random partial reinforcement and the assumption that anticipatory frustration is particularly susceptible to the depressant action of sodium amytal.—*Journal abstract.*

ENVIRONMENTAL EFFECTS

7718. Cohen, S. I., Silverman, A. J., & Shmavonian, B. M. (Duke U. Medical Cent., Durham, N. C.) Psychophysiological studies in altered sensory environments. *J. psychosom. Res.*, 1962, 6(4), 259-281.—By making the situation highly ambiguous, sensory deprivation of 2 hours has the same disruptive effect as longer sessions. 12 field-oriented (FO) college males, in contrast to 12 body-oriented (BO) ones, on the basis of rod-and-frame and draw-a-person tests, had more psychological and bodily discomfort, more imagery, and disorganization of thought. The arousal level (EEG) of the FOs rose more during the session, and afterwards their sensory discrimination was poorer. In a subsequent experiment, the effects of a sedative, stimulant, or placebo were studied. These tended to calm the FOs and to disturb the BOs. In another study where placebo and LSD were administered, the latter made the Ss behave like FOs. (40 ref.)—W. G. Shipman.

7719. Farrer, Donald N., & Bogo, Victor. Chimpanzee performance during a simulated three-day space flight. *USAF ARL tech. docum. Rep.*, 1962, No. 62-25. vii, 27 p.—Chimpanzee performance during a simulated 97-hr. space flight profile environment was evaluated with a pilot study and a crossover design. The response rate on the continuous avoidance task was significantly lower for 1 S in the 100% O₂ environment, and both Ss performed at lower rates during night work sessions on all tests. There was no

evidence of reaction time decrement for any S on the discrete avoidance task. Food and water consumption was poor during the simulated space flight, but a chimpanzee could withstand a 97-hr. flight profile environment of 100% O₂ at 14.7 psi for 15 hr. followed by 100% O₂ at 5 psi, for 82 hr. without serious performance changes.—*USAF ARL*.

7720. Rohles, Frederick H., Jr., & Reynolds, Herbert H. A proposed approach toward determining the psychophysiological effects of prolonged manned space flight. *USAF ARL tech. docum. Rep.*, 1962, No. 62-28. iii, 5 p.—Orbital space flights are proposed to study the psychophysiological effects of prolonged weightlessness and cosmic radiation. The program presented will use animal Ss and attempts to eliminate weightlessness and cosmic radiation as deterrents to manned space flights of higher altitudes and longer duration.—*USAF ARL*.

7721. Tapp, Jack T., Markowitz, Hal. (Vanderbilt U.) Infant handling: Effects on avoidance learning, brain weight, cholinesterase activity. *Science*, 1963, 140(Whole No. 3566), 486-487.—Infant rats were "handled" by removing them periodically from their home cages. "Non-handled" rats were left undisturbed. ½ of the animals were killed at weaning, and weights and cholinesterase activity were determined on 4 different sections of the brain. The remaining animals were conditioned to avoid an administered shock. Handling increased ventral-cortex and subcortical weights and decreased subcortical cholinesterase. No differences in avoidance conditioning were observed.—*Journal abstract*.

Radiation

7722. Carver, Michael C., & Close, Perry. The effect of prior X-irradiation on the survival of mice in explosive decompression. *USN Sch. Aviat. Med. res. Rep.*, 1962, Proj. MR005.13-1002, Subtask 17, Rep. No. 3. ii, 6 p.—Mice were exposed to varying doses of X-irradiation, then explosively decompressed shortly afterward. The survival proportion of irradiated animals is not significantly lower than nonirradiated, explosively decompressed animals, even with the radiation dose several times in excess of the LD₅₀-30 day dose.—*USN SAM*.

7723. Davis, Roger T., & McDonald, Arthur L. (U. South Dakota) Perception of oddity by monkeys as a function of aging and radiation. *Psychol. Rep.*, 1962, 11(2), 383-386.—After size oddity training, 14 rhesus monkeys were tested on a modification of the oddity problem similar to the method of bisection. The left and right stimuli served as standards of .75 and 3.50 in. high, respectively. The center stimulus (never correct) varied from .75 to 3.50 in. in steps of .25 in. in either ascending or descending series. 4 old irradiated Ss (11-12 yr.) shifted response when the variable object was approximately ½ the height of the tall standard object. 5 old nonirradiated monkeys shifted when the variable was more nearly ½ the distance between the tops of the short and tall standards. 5 younger monkeys (3.5-5.5 yr.) were inferior to the older groups. "The results are discussed as giving further evidence of the difference in scope of attention of irradiated and non-irradiated monkeys and not what would be predicted from the hypothesis that aging and radiation effects are identical."—*B. J. House*.

7724. Furchtgott, Ernest. (U. Tennessee) Behavioral effects of ionizing radiations: 1955-61. *Psychol. Bull.*, 1963, 60(2), 157-199.—A review of the rapidly increasing literature. The conclusions included: (a) Mammals irradiated pre- or neonatally show relatively permanent deficits in several behavioral domains, such as learning, motor functions, mating, etc. (b) Some investigators report that even small doses affect neural functions and consequently CR acquisition while other find no effects even with large doses. (c) Radiation, however, may be an UCS in avoidance conditioning. Also, several motivational variables are affected. (d) Except for vision where the results are equivocal the data on sensory functions are scant. (e) There is little evidence for long-term human changes. (f) It is emphasized that radiation may be a potentially useful tool in several areas. (195 ref.)—*Journal abstract*.

7725. Pizzarello, Donald J., Witcowski, Richard L., & Lyons, E. Ann. (Bowman Gray School Medicine, Winston-Salem, N. C.) Variations in survival time after whole-body radiation at 2 times of day. *Science*, 1963, 139(Whole No. 3552), 349.—Rats, anesthetized with sodium pentobarbital, given 900 roentgens of x-radiation over the entire body, survived more than 130 days when the radiation was given in the morning. The same dosage killed all the animals within 13 days when the radiation was given at night.—*Journal abstract*.

Stress

7726. Brady, J. P., Thornton, D. R., & de Fisher, D. (Indiana Medical Cent. Indianapolis) Deleterious effects of anxiety elicited by conditioned preaversive stimuli in the rat. *Psychosom. Med.*, 1962, 24(6), 590-595.—A comparison was made of the deleterious effects (mortality and morbidity) of a conditioned emotional response (anxiety) and of the aversive stimulus itself (electric shock). One group had the shocks preceded by a buzzer. The 2nd group had the same amount of shock without a preaversive stimulus. The 3rd group received neither shock nor buzzer. Mortality and morbidity were greatest for the 1st group. The experiment was done 4 times, varying parameters and conditions.—*W. G. Shipman*.

Nutrition

7727. Sanahuja, Juan C., & Harper, Alfred E. (U. Wisconsin) Effect of amino acid imbalance on food intake and preference. *Amer. J. Physiol.*, 1962, 202(1), 165-170.—Imbalance was created by adding 3.8% of an amino acid mixture lacking histidine to a diet containing 6% beef fibrin. Protein-depleted rats fed balanced or imbalanced diets ate equal amounts for 3 days; then growth rate and food intake of those on the imbalanced diet dropped. When offered protein-free diet and the imbalanced-diet, depleted rats at first refused the former but after 3 days preferred it. Animals fed the balanced diet or the imbalanced diet plus histidine refused the protein-diet.—*D. R. Peryam*.

GENETICS & BEHAVIOR

7728. Denenberg, Victor H., Ross, Sherman, & Blumenfeld, Michael. (Roscoe B. Jackson Memorial Lab.) Behavioral differences between mutant

and nonmutant mice. *J. comp. physiol. Psychol.*, 1963, 56(2), 290-293.—The purpose of this study was to determine whether behavioral differences could be related to mutant genes. 4 mutant strains of mice were tested on several behavioral measures. Within each strain there were 2 kinds of Ss, each highly inbred except for 1 mutant gene. In the Hairless strain it was found that the hairless mutant was significantly less active in an openfield test and was also unable to perform adequate in a swimming task. In the Pintail strain the mutant extinguished an escape response significantly faster than the normal. No behavioral correlates could be found for either the short-ear or pale-ear genes.—*Journal abstract.*

7729. Gottesman, Irving I. (Harvard U.) **Differential inheritance of the psychoneuroses.** *Eugen. Quart.*, 1962, 9(4), 223-227.—Holzinger's heritability index H, and F-ratios between fraternal and identical within pair variances, were calculated for scales from the MMPI and Cattell's High School Personality Questionnaire (HSPQ) in this study of 34 identical and 34 like-sexed fraternal twin pairs. Zygosity determinations were based on tests for 9 blood groups. The results differed somewhat between the 2 sexes. For the combined samples, significant results beyond the 10% level were found for the Depression and Social Introversion scales of the MMPI and for the Depressed versus Enthusiastic (F) and Confident versus Guilt Prone (O) scales of the HSPQ. The author concludes that neuroses with hypochondriacal and hysterical elements have at most a small hereditary component, while those with elements of anxiety, depression, obsession, and schizoid withdrawal have a substantial hereditary component under the environmental conditions obtaining for this particular adolescent sample.—*S. G. Vandenberg.*

7730. Levine, Seymour, & Broadhurst, P. L. (U. London, England) **Genetic and ontogenetic determinants of adult behavior in the rat.** *J. comp. physiol. Psychol.*, 1963, 56(2), 423-428.—80 rats from the Maudsley Reactive and Nonreactive Strains, selected for emotional defecation, were subjected to controlled infantile stimulation. When adult, they were tested for open-field emotionality and escape-avoidance conditioning in a factorial design, which included strain, treatment, sex, and test-order variables. Both heredity and environment had significant effects, and also display interaction. The scores from the open-field showed that infantile stimulation caused a significant decrease in emotionality indexes which is attributed to a change in the capacity to respond to stress. The reactive strain was significantly poorer in escape-avoidance conditioning. (17 ref.)—*Journal abstract.*

7731. Lundstrom, Anders. (Dental School, Stockholm, Sweden) **Tooth morphology as a basis for distinguished monozygotic and dizygotic twins.** *Amer. J. Hum. Genet.*, 1963, 15(1), 34-43.—A detailed examination of dental casts led to the same diagnosis of zygosity in 117 out of 124 pairs. The Author concludes that a fairly reliable judgment about zygosity is possible from dental casts provided the O has a good knowledge of the variation in tooth morphology.—*S. G. Vandenberg.*

7732. Mesnikoff, Alvin M., Rainer, John D., Kolb, Lawrence C., & Carr, Arthur C. **Intra-familial determinants of divergent sexual behavior**

in twins. *Amer. J. Psychiat.*, 1963, 119(8), 732-738.—4 sets of 1-egg twins and 1 2-egg male twin pair furnished data that revealed certain parental attitudes which alone, and in combination, and through a series of familial transactions determined the differential psychosexual role of the twins.—*N. H. Pronko.*

7733. Post, R. H. (U. Michigan) **Population differences in vision acuity: A review, with speculative notes on selection relaxation.** *Eugen. Quart.*, 1962, 9(4), 189-212.—In this review the author examines critically the question whether poor vision is more common under the conditions of modern civilization than it was in primitive cultures. First the genetic basis for refraction aberrations which form the most frequent defects of visual acuity is reviewed. Next, reports of different frequencies of refractive errors in various populations are summarized and found to agree to some extent on the existence of such differences. Finally the author raises the possibility of relaxation of earlier selection pressures against defective vision in prehistoric hunting and food gathering societies as an explanation for the higher frequencies of refractive errors among populations with long histories of agriculture and/or permanent settlement.—*S. G. Vandenberg.*

7734. Salagh, G., & Edgerton, R. B. (Pacific State Hosp., Pomona, Calif.) **Sterilized mental defective look at eugenic sterilization.** *Eugen. Quart.*, 1962, 9(4), 213-222.—50 former patients out a possible total of 110 were located and interviewed. 40 of these had been sterilized and expressed an opinion about the desirability of the operation. Over $\frac{3}{4}$ disapproved with more females and more married males disapproving than single males. A number of quotations are used to illustrate attitudes encountered.—*S. G. Vandenberg.*

7735. Willham, R. L., Cox, D. F., & Karas, G. G. (Iowa State U.) **Genetic variation in a measure of avoidance learning in swine.** *J. comp. physiol. Psychol.*, 1963, 56(2), 294-297.—Differences among individuals in response to avoidance learning situations are usually maximal when the average probability of avoidance is near $\frac{1}{2}$. This average was realized in the 3rd set of 10 trials given 572 young swine. The purpose of this work was to measure the relative amount of variance that is of genetic origin in number of avoidances made by Ss in the 3rd set of 10 trials. Genetic variance was separated from other sources by using the correlation between numbers of avoidances made by related individuals. Nearly 50% of the variance among pigs belonging to relatively homogeneous groups was attributable to additively genetic causes. Clearly, differences among individuals for this measure of learning ability in swine are influenced by the heredity of the individuals.—*Journal abstract.*

LATERAL DOMINANCE

7736. Chateau, J. **La latéralisation et ses effets.** [Lateralization and its effects.] *Enfance*, 1962, No. 3, 223-262.—Detailed summary of data from 3770 Ss from preschool to adult, relative to incidence of left handedness, ambidexterity, and right handedness in writing, cutting with a knife, and throwing a ball. Numerous tables and graphs summarize obtained relationships. A statistic J is developed to indicate degree of consistency between handedness on the above-men-

tioned 3 acts. The effect of handedness upon mode of drawing animals, utensils, and the face is shown. Data are held to support a general education factor and specific factors, but the existence of a constitutional factor is not denied.—*S. S. Marzolf.*

ANIMAL PSYCHOLOGY

7737. Candland, Douglas K., & Culbertson, Jack L. (Bucknell U.) **Age, type and duration of deprivation, and consummatory preference in the rat.** *J. comp. physiol. Psychol.*, 1963, 56(3), 565-568.—Rats of either 23 or 50 days of age ($N = 522$) were deprived of food, water, or both and water for 1, 12, 24, 48, or 72 hr. Preference for food or water during the 1st hr. following the deprivation experience, latency, the number of Ss which did not select either substance in the 1-hr. test period, and weight loss were recorded. Preference appears to be the most sensitive measure of motivation examined in this study in that it indicates differences as a function of age which other measures overlook.—*Journal abstract.*

7738. Duda, John J., & Bolles, Robert C. (U. Rochester) **Effects of prior deprivation, current deprivation, and weight loss on the activity of the hungry rat.** *J. comp. physiol. Psychol.*, 1963, 56(3), 569-571.—During a single 24-hr. period without food, following different immediately-prior deprivation conditions, 7 groups of naive rats were tested in activity wheels. The groups were under 0-, 24-, 48-, 72-, or 96-hr. immediately-prior continuous deprivation and some groups had, in addition, 10 days of experience with a cyclic 24-hr. feeding schedule just prior to the continuous deprivation. It was found that, apart from the effect that these different deprivation conditions had upon S's loss of body weight, they had no effect upon activity. Activity level was found to be predominantly a function of weight loss, and independent of how weight had been lost.—*Journal abstract.*

7739. Hayes, W. N., & Warren, J. M. (U. Rochester) **Failure to find spontaneous alternation in chicks.** *J. comp. physiol. Psychol.*, 1963, 56(3), 575-577.—A series of 3 experiments were conducted to determine whether White Rock chicks, 2-6 days old, exhibit spontaneous alternation behavior in situations where alternation behavior has been demonstrated in rats and various invertebrate forms. In none of the studies was there any evidence of significant alternation of successive responses by chicks. These results suggest that the phenomenon of spontaneous alternation may not be as ubiquitous as some current behavior theories imply.—*Journal abstract.*

7740. Heitman, Hubert, Jr., Hahn, LeRoy; Bond, T. E., & Kelly, S. F. (U. California) **The effects of modified summer environment on swine behaviour.** *Anim. Behav.*, 1962, 10(1-2), 15-19.—Groups of 9 pigs were penned alike except for such extra heat relief measures as open shade, wallows, and airconditioned houses. During the 50 days of observation experimental groups showed weight gains greater than controls who had no special relief measures, but these gains did not relate to total time spent utilizing the relief.—*W. J. Coppock.*

7741. Hutchinson, J. C. D., & Taylor, W. W. (Poultry Research Cent., Edinburgh, Scotland) **Motor co-ordination of pecking fowls.** *Anim. Behav.*,

1962, 10(1-2), 55-61.—Pecking skill on a rotating turntable and hard and soft floors was tested over a period of 5 weeks and, for 3 hens, retested a year later. Rate of pecking and grains per minute taken was disrupted for a number of days following cautious trimming of the beak. "There was an inverse correlation between area of the comb and both rate and accuracy of pecking. Rate of pecking and accuracy were positively correlated. It is concluded that when a group of fowls is given a limited amount of grain, varying skill as well as the social hierarchy will make an important contribution to differences in consumption between individual birds."—*W. J. Coppock.*

7742. Hutchinson, J. C. D., & Taylor, W. W. (Poultry Research Cent., Edinburgh, Scotland) **Effect of exposure to heat on the motor co-ordination of pecking fowls.** *Anim. Behav.*, 1962, 10(1-2), 62-66.—The motor coordination of cocks and hens was examined when they were pecking grain from a turntable apparatus in hot atmospheres. Performance was studied at the following ambient temperatures: 90°, 95°, 98°, 101°, and 103° F., with a humidity of 11 mm. Hg vapor pressure and an air movement of 20 ft/min. The birds were able to inhibit their thermal polypnoea to perform the test. At rectal temperatures somewhere between 110° and 112° F., the birds refused to cooperate. In contrast with various similar experiments which have been performed on man, accuracy was as good or better in the heat than in a control environment of 65° F. The rate of work decreased significantly at ambient temperatures above 95° F. The number of grains taken per minute decreased slightly in the heat.—*W. J. Coppock.*

7743. Marler, P., Kreith, M., & Willis, E. (U. California) **An analysis of testosterone-induced crowing in young domestic cockerels.** *Anim. Behav.*, 1962, 10(1-2), 48-54.—Tape-recordings, made from about 1 week to 12 weeks of age, of crowing induced in young domestic cockerels by testosterone implants have been analyzed on the sound spectrograph. At any one time each individual uses the same basic pattern, with variations. Striking and consistent differences occur between the patterns of individual chicks. A comparison of juvenile crowing in 3 highly inbred lines of white leghorns of different parentage did not reveal any consistent differences, nor did a similar comparison of crowing in 3 hybrid strains. The latter had more variable crows than the inbred lines. While genetic factors seem to control such characteristics as the duration of crowing and the period of frequency oscillation (which is similar in young and old birds), different degrees of inbreeding for egg and meat production, etc., have had little consistent effect on the crowing pattern.—*W. J. Coppock.*

7744. Sakagami, Shōichi F., & Hayashida, Kazuo. (Hokkaido U., Japan) **Work efficiency in hetero-specific ant groups composed of hosts and their labour parasites.** *Anim. Behav.*, 1962, 10(1-2), 96-104.—Workers of 3 species were placed in a test formicary consisting of tubes 40 cm. long half-filled with sand. The amount of sand excavated during 24 hours by groups consisting of the host species, *Formica fusca*, in various combinations with the labor parasitic species, *F. sanguinea* and *Polyergus samurai*, was measured. Results showed no work nor effect on performance of *fusca* by *samura*, less efficient work by

sanguinea, and a decrease in individual efficiency as group size increased.—*W. J. Coppock.*

7745. **Stride, George O., & Warwick, Esme P.** (Cunningham Lab., Brisbane, Australia) **Ovipositional girdling in a North American cerambycid beetle, *Mecas saturnina*.** *Anim. Behav.*, 1962, 10 (1-2), 112-117.—Examples of cerambycid behavior are reviewed, and the girdling behavior of *Mecas saturnina* is described. The effects of girdling on the water relationships of the stem, in the absence of a transpiration stream, have been investigated and seem insufficient to explain the girdling behavior. A hypothesis is advanced whereby the double-girdling behavior of *M. saturnina* may be regarded as a device originally evolved to permit the use of succulent green shoots of otherwise woody plants as food for cerambycid larvae. It had been retained in *M. saturnina* since it promotes advantageous changes, possibly increased pithiness, in the herbaceous host plant attacked.—*W. J. Coppock.*

7746. **Wallis, D. I.** (Cambridge U., England) **Behaviour patterns of the ant, *Formica fusca*.** *Anim. Behav.*, 1962, 10(1-2), 105-111.—A description and classification of responses of workers: behavior not involving another individual (running, etc.), behavior involving another (aggressive behavior, etc.), and behavior associated with brood (feeding, etc.).—*W. J. Coppock.*

NATURAL OBSERVATION

7747. **Morton, J. E.** (U. Auckland, New Zealand) **Habit and orientati in the small commensal bivalve mollusc, *Montacuta ferruginosa*.** *Anim. Behav.*, 1962, 10(1-2), 126-133.—The pedal mucous trails made during orienting responses to light, gravity, and chemostimulation were studied with reference to orientation in natural conditions. A comparison with the noncommensal *Lasaea rubra* under similar stimulation is made.—*W. J. Coppock.*

7748. **Stein, Robert Carrington.** **Isolating mechanisms between populations of Traill's Flycatchers.** *Proc. Amer. Phil. Soc.*, 1963, 107, 21-50.—2 types of Traill's Flycatchers, which sometimes inhabit the same territory, closely resemble each other in appearance and are principally distinguished by their songs. Careful examination shows slight differences in morphology and in nesting habits, which like the songs remain distinct for the 2 types. Mutual recognition in the mating season is entirely by song and not visual. Response to tape-recorded songs is specific. Presumably these types are distinct species. The names *Empidonax traillii* (Audubon), Traill's Flycatcher, and Alder Flycatcher might be retained for the species with the "Fee-bee-o" song, the names *Empidonax brewsteri* (Oberholser) or Willow Flycatcher for the species with the "Fitz-bew" song.—*E. G. Boring.*

7749. **Wilson, Edward O.** (Harvard U.) **Chemical communication among workers of the fire ant, *Solenopsis saevissima* (Fr Smith): I. The organization of mass-foraging.** *Anim. Behav.*, 1962, 10 (1-2), 134-147.—Colonies were housed in circular artificial nests placed on glass platforms which served as foraging fields. Studies of exploration of new territory, behavior at a food find, trail-laying, recruitment of new workers, specificity of the trail sub-

stance, and artificial induction of mass-foraging, suggest that recruitment in foraging is organized by the use of a trail substance secreted by Dufour's gland.—*W. J. Coppock.*

EARLY EXPERIENCE (INCLUDING IMPRINTING)

7750. **Berkson, Gershon, & Fitz-Gerald, Frances L.** (Yerkes Lab. Primate Biology, Orange Park, Fla.) **Eye fixation aspect of attention to visual stimuli in infant chimpanzees.** *Science*, 1963, 139 (Whole No. 3555), 586-587.—Infant chimpanzees look at a visual stimulus for a regularly decreasing proportion of the time after presentation of the stimulus. Individual differences and presentation of a novel object affect the general level of fixation but do not significantly influence the slope of the curve showing the decline of fixation with time.—*Journal abstract.*

7751. **Denenberg, Victor H., & Smith, S. A.** (Purdue U.) **Effects of infantile stimulation and age upon behavior.** *J. comp. physiol. Psychol.*, 1963, 56(2), 307-312.—One group of rats was given 3 min. of shock on Days 11-20 of life, another group experienced handling, and a control group was not disturbed. Ss were weaned and weighed at 25 days. At 50, 100, 150, or 200 days independent groups ($N = 144-162$) received open-field testing, avoidance learning, and extinction. Ss were sacrificed and body, adrenal, and thymus weights obtained. Within age range studied, effects of infantile stimulation upon behavior were invariant. Nonhandled controls had highest defecation rate and were least active. Ss shocked in infancy took longest to respond in learning situation. Ease of avoidance learning and resistance to extinction increased with age. Open-field behavior was constant over age before introduction of avoidance learning but increased with age subsequently.—*Journal abstract.*

7752. **Greenbaum, Marvin, & Gunberg, D. L.** (U. Oregon) **The effect of neonatal hyperoxia on sexual arousal and emotionality in the male rat.** *Anim. Behav.*, 1962, 10(1-2), 28-33.—Neonatal hyperoxia was studied as a method of provoking behavioral disturbances in animals because of its possible connection with adaptive deficiencies observed in premature human infants who had been exposed to excessive O_2 at birth. The sexual responsiveness and emotionality of adult rats was measured after they had been subjected to hyperoxia for 10 days after birth. These Ss were found to be less sexually responsive (longer mount latencies and smaller percentage of mounters) and more emotional (more defecation in the open field apparatus, larger adrenals, and smaller body weights) than untreated controls. 2 other control groups of blinded and blinded plus O_2 treated Ss yielded comparable patterns to the O_2 group. These findings were interpreted to indicate that neonatal hyperoxia could be a potent influence on some aspects of adaptive behavior and that at least one of its consequences was to establish long term stress factors which were apparently also introduced by the other treatments.—*W. J. Coppock.*

7753. **Kovach, Joseph K., & Hess, Eckhard H.** (U. Chicago) **Imprinting: Effects of painful stimulation upon the following response.** *J. comp. physiol. Psychol.*, 1963, 56(2), 461-464.—3 conditions of electric shocks of different intensities and frequencies

administered during the imprinting experience were tested for their effects on chicks at 14, 18, 32, or 48 hr. after hatching. Experimental Ss followed significantly more than controls at 14 and 18 hr. if the shocks were either strong but infrequent, or relatively weak but much more frequent. Older chicks, however, followed significantly less under these 2 shock conditions. Strong and frequent shocks did not affect the amount of following in Ss at 14 hr., but seriously interfered with it at all later ages. The data, in light of the maturational state of the Ss, indicate that the performance of following is approximately an inverted U shaped function of the intensity of the neural activity associated with the administration of painful stimulation.—*Journal abstract.*

7754. Lindzey, Gardner; Winston, Harvey D., & Manosevitz, Martin. (U. Minnesota) Early experience, genotype, and temperament in *Mus musculus*. *J. comp. physiol. Psychol.*, 1963, 56(3), 622-629.—Each of 4 strains of inbred mice was divided into an experimental group, exposed to noxious, infantile stimulation, and a control group. Effects of treatment were assessed at 30 days by an open-field measure of emotionality and motility, at 70 days by a stovepipe measure of timidity, and at 100 days by the open-field measure. Significant strain differences were observed in all measures; experimental Ss were more emotional and less motile at 30 days and more timid at 70 days than control Ss. 3 of 5 tests for interaction between genetic (strain) and ontogenetic (infantile treatment) factors were significant. These results are unambiguous concerning the importance of genotype and infantile trauma as determinants of mouse temperament. (25 ref.)—*Journal abstract.*

7755. Lockard, Robert B. (U. Wisconsin) Self-regulated exposure to light by albino rats as a function of rearing luminance and test luminance. *J. comp. physiol. Psychol.*, 1963, 56(3), 558-564.—Male albino rats were reared from weaning in 1 of 7 different lighting conditions, then tested with a 2-bar procedure that allowed on and off control of test-chamber lights of several intensities. The test session was for 12 consecutive days. After 6 days away from their rearing environment, the differently-reared rats continued to perform differently in the same test situation. Thus being reared in different illuminations not only significantly affected performance, but had a very persistent effect.—*Journal abstract.*

7756. Moltz, Howard. (Brooklyn Coll.) Imprinting: An epigenetic approach. *Psychol. Rev.*, 1963, 70(2), 123-138.—The analysis presented takes an epigenetic approach as a point of departure in specifying the manner in which intrinsic and extrinsic factors participate in the development and organization of the imprinting response in precocial birds. It suggests that during the early neonatal "critical period," the response functions to modulate the gross sensory input provided by the imprinting object so as to make it fall within the range necessary to evoke a parasympathetically-governed organic set and that, thereafter, attachment to the object is maintained by a process of selective learning, with fear reduction functioning as the reinforcing agent. Several experiments suggested by the present analysis were discussed. (40 ref.)—*Journal abstract.*

7757. Ottinger, Donald R., Denenberg, Victor H., & Stephens, Mark W. (Purdue U.) Maternal

emotionality, multiple mothering, and emotionality in maturity. *J. comp. physiol. Psychol.*, 1963, 56(2), 313-317.—3 experiments were conducted to test the hypotheses that offspring emotionality is positively associated with mother's level of emotionality (rated from pre-pregnancy open-field behavior) and that offspring experiencing multiple mothering (mother rotated between her own litter and one foster litter every 24 hr.) are more emotional in adulthood than offspring reared by a single mother. Ss were 269 Purdue-Wistar rats from 36 litters. Experiment 1 employed a 3×2 factorial design. Offspring were weighed at 21, 50, and 62 days and tested in the open field daily on Days 50-53. Open-field emotionality data confirmed both hypotheses. Experiments 2 and 3 established that offspring emotionality is independently related to both prenatal and postnatal emotionality of mother.—*Journal abstract.*

7758. Sackett, Gene P. (Claremont U. Coll.) A neural mechanism underlying unlearned, critical period, and developmental aspects of visually controlled behavior. *Psychol. Rev.*, 1963, 70(1), 40-50.—It is proposed that innate visual perceptual and preferential choice behavior, forming the basis for release of fixed action patterns in many species including humans, is organized and integrated neurally by the retinal ganglion cells. A neural mechanism based on the differential sensitivity of these cells to specific aspects of stimulation, with cells exhibiting a differential rate of maturation paralleling the maturation of certain behavior, is developed. It is hypothesized that this mechanism is responsible for onset of the imprinting critical period, inborn preferential choice responses, innate object recognition, and the stimulus-specific releasing function involved in fixed action patterns. Evidence supporting the neural model is presented, and specific examples of relevant behavior are explained in terms of the model.—*Journal abstract.*

7759. Shinkman, Paul G. (U. Michigan) Visual depth discrimination in day-old chicks. *J. comp. physiol. Psychol.*, 1963, 56(2), 410-414.—Dark-reared day-old Leghorn chicks were tested individually for side preference in a visual cliff. 107 Ss received various treatments immediately prior to testing, including 2 hr. of pre-exposure to a stimulus field resembling the deep side of a visual cliff, reduction to monocular vision, or topical application of d-tubocurarine chloride on the cornea. Principal conclusions were: (a) Day-old chicks exhibit unlearned visual depth discrimination. (b) Cues provided by focusing are critical for this discrimination; binocular and motion parallax cues are not. (c) Pre-exposure to the stimulus field does not contravene avoidance of the deep side, even when Ss are allowed no other visual experience whatever.—*Journal abstract.*

7760. Soskin, Robert A. (Washington U.) The effect of early experience upon the formation of environmental preferences in rats. *J. comp. physiol. Psychol.*, 1963, 56(2), 303-306.—To determine whether a period of constant exposure to a vibratory environment would result in a preference for vibration in the rat, separate groups of Ss were raised from 1-21, 22-43, or 44-65 days of age, in cages with floors which transmitted constant, mild vibration. No group preferred vibration over a stable environment. However, Ss raised in a vibrating environment from 1-21

days of age showed significantly less tendency to avoid vibration than controls, whether tested 10 days after exposure to vibration or at 80 days of age. The results were consistent with a critical age period hypothesis.—*Journal abstract.*

7761. Winston, Harvey D. (U. Minnesota) **Influence of genotype and infantile trauma on adult learning in the mouse.** *J. comp. physiol. Psychol.*, 1963, 56(3), 630-635.—This investigation was concerned with effects of infantile trauma and hereditary factors upon adult learning in 3 inbred mouse strains. $\frac{1}{2}$ the infant Ss in each strain received traumatic auditory stimulation, and $\frac{1}{2}$ were reared under standard conditions. Adult learning ability was examined by means of repeated trials in a 4-unit alley maze and in a water escape test. Significant strain differences in maze and water escape learning were observed, and Ss traumatized during infancy were significantly poorer in maze performance than control Ss. There was also a significant interaction between strain and infantile experience in their effect upon maze learning. There was no evidence for treatment effects or a strain-treatment interaction in the water escape test. (20 ref.)—*Journal abstract.*

REFLEXES & INSTINCTIVE BEHAVIOR

7762. Hinde, R. A., & Steel, E. A. (Cambridge U., England) **Selection of nest material by female canaries.** *Anim. Behav.*, 1962, 10(1-2), 67-75.—5 studies are reported on birds caged individually or in pairs. 2 sizes of nest cups and 2 types of cages were used. Nesting material was provided during the 12-minute watches which were made 2-4 times weekly. Birds not actively building showed no preference between grass and feathers. Females treated with estrogen, building in large cups, select mostly grass. Addition of progesterone does not effect this preference. In normal building, the female uses a larger proportion of feathers as the egg-lying date approaches. There is no regular correlation between time spent sitting on the nest and proportion of feathers carried.—*W. J. Coppock.*

7763. Maier, Richard A. (Kansas State U.) **Maternal behavior in the domestic hen: The role of pretest restriction of movement.** *J. comp. physiol. Psychol.*, 1963, 56(2), 350-356.—3 experiments demonstrated that pretest restriction of movement of broody hens significantly affects direction and duration, but not intensity, of broody responses. Restriction of hens while chicks were unrestricted resulted in indiscriminate brooding when hens were released, and indiscriminate clucking to recorded chick sounds. Failure to differentiate familiar chicks is attributed to the hen's limited opportunity to organize her brood under restrictive conditions. Restriction of both hens and chicks, so that hens could not escape from chicks when broodiness began to dissipate, resulted in longer periods of broodiness. A 4th experiment demonstrated that when hens are presented with increasing complexities of cues from familiar chicks, intensity (clucking rate) increases linearly with number of cues, regardless of pretest restriction conditions. (22 ref.)—*Journal abstract.*

7764. Maier, Richard A. (Kansas State U.) **Maternal behavior in the domestic hen: The role of physical contact.** *J. comp. physiol. Psychol.*, 1963, 56(2), 357-361.—In 3 experiments the development

of broodiness was studied in relation to restriction of physical contact between hen and chicks. Compared to control Ss, significantly fewer experimental Ss developed broodiness when isolated from physical contact with chicks by confinement in cages adjacent to chicks or above chicks (presumably normal position for brooding) and when contactual ventral surface of Ss was anesthetized to eliminate contact cues. In 3 parallel experiments on the maintenance of broodiness, it was found that Ss do not remain broody as long as control Ss when contact with chicks is eliminated by isolating chicks adjacent to or below Ss or by anesthetizing Ss contactual ventral surface.—*Journal abstract.*

7765. Schreiber, Bruno; Gualtierotti, Torquato, & Mainardi, Danilo. (U. Parma, Italy) **Some problems of cerebellar physiology in migratory and sedentary birds.** *Anim. Behav.*, 1962, 10(1-2), 42-47.—Cerebellar electrical responses in several hundred chronic pigeons and doves were studied to test a Coriolis force interpretation of homing. Both migratory and sedentary birds showed an increase in amplitude of discharge at the start of and during constant rotation. Amplitude was proportional to acceleration during rotation. Simultaneous EMG recording showed "the response was not influenced by simultaneous muscular activity." After rotation stopped, rhythmic spindle-shaped afterdischarges continued for several seconds in homing pigeons and homing doves; no such afterdischarges were evident in nonhoming varieties. The sensitivities demonstrated were in the order of 1000 times that calculated as minimal for a Coriolis interpretation of homing.—*W. J. Coppock.*

MOTIVATION & EMOTION

7766. Bolles, Robert C. (Hollins Coll.) **Effect of food deprivation upon the rat's behavior in its home cage.** *J. comp. physiol. Psychol.*, 1963, 56(2), 456-460.—15 rats were observed in their home cages by sampling their behavior across time to determine how activity varies with deprivation and as a function of the time of day. A hungry group was maintained for 12 days on a 24-hr. feeding cycle; the control group was maintained on ad lib. food and water. The activity of the hungry group was only found to differ from its own ad lib. baseline activity or from the activity of the control group on the last 4 deprivation days. At that time hungry Ss were significantly more active than control Ss, but the changed pattern of activity is attributed to conditioning rather than to a direct activating effect of deprivation.—*Journal abstract.*

7767. Hagamen, Wilbur D., Zitzmann, Eric K., & Reeves, Alexander G. (Cornell U. Medical Coll.) **Sexual mounting of diverse objects in a group of randomly selected, unoperated male cats.** *J. comp. physiol. Psychol.*, 1963, 56(2), 298-302.—60 unoperated male cats were tested for sexual mounting behavior. 30 mounted rabbits, and 11 of these mounted inanimate objects; however, these 30 cats appeared in the last 39 tested. 2 modifications of testing procedure responsible for this change were: (a) Ss were left alone in the experimental room for a longer time each day before testing, and (b) Ss were tested more intensively with rabbits and inanimate objects before exposure to an estrous female in the experimental

room. Ss' activity was as vigorous and persistent as that exhibited by any operated cats we have seen and, once established, occurred under the same variety of experimental conditions. It was not necessary to reinforce this behavior by presentation of an estrous female and repeated experience with female cats actually decreased the aberrant tendencies.—*Journal abstract.*

7768. Kissel, John W. (Mead Johnson Research Cent., Evansville, Ind.) **Nutating annular cage for measuring motor activity.** *Science*, 1963, 139 (Whole No. 3560), 1224-1225.—The construction of an activity-measuring device that utilizes a nutating annular animal enclosure is described. The instrument converts motor activity to numerical scores. With mice, the logarithms of these scores assume a normal distribution. A 2nd test occurring 1 day, week, or month after the 1st fails to exhibit any habituation of the animals.—*Journal abstract.*

7769. McReynolds, Paul. (Palo Alto VA Hosp., Calif.) **Exploratory behavior: A theoretical interpretation.** *Psychol. Rep.*, 1962, 11(2), 311-318.—A perceptual-cognitive interpretation is presented which considers 3 different motivational functions which exploration may serve: "(1) novelty-adjustive exploration; (2) novelty-seeking exploration; and (3) goal-oriented novelty-seeking exploration. The theoretical model conceptualizes novelty-adjustive exploration as reflecting an animal's attempt to assimilate novel perceptions. Novelty-seeking exploration is considered as serving to maintain an optimum rate of cognitive restructuring. The effects of previous experience on exploratory behavior were considered."—B. J. House.

7770. Nachman, Marvin. (U. California, Riverside) **Learned aversion to the taste of lithium chloride and generalization to other salts.** *J. comp. physiol. Psychol.*, 1963, 56(2), 343-349.—Rats given 1 10-min. trial of drinking LiCl learned to avoid drinking that substance again. The learned aversion to drinking LiCl was found to generalize most to the drinking of NaCl, and in lesser degrees, to the drinking of NH_4Cl , KCl, and H_2O . By repeated tests with NaCl, NH_4Cl , KCl, or H_2O , the learned drinking aversion was extinguished, and the extinction, particularly with NaCl, was found to generalize so that Ss would again drink LiCl. In 2-bottle preference tests, Ss were found to readily discriminate between LiCl and either NH_4Cl or KCl but to have difficulty in discriminating between LiCl and NaCl. These data were related to the electrophysiological responses of the chorda tympani to these salts.—*Journal abstract.*

7771. Prokasy, William F. (Pennsylvania State U.) **Berlyne's conflict theory and the acquisition of observing responses.** *Psychol. Rep.*, 1962, 11(2), 341-342.—Discussion of Berlyne's (see 37: 4664) interpretation of a study by Wehling and Prokasy (see 37: 2796).—B. J. House.

7772. Singer, Jerome E. (Pennsylvania State U.) **Sympathetic activation, drugs, and fear.** *J. comp. physiol. Psychol.*, 1963, 56(3), 612-615.—In a test of the hypothesis that the amount of emotional behavior displayed is a direct function of the degree of sympathetic activity, 72 naive albino rats were divided into 3 groups, each group being subjected to sympathetic activation via a drug injection:adrenalin

produced the highest activation, chlorpromazine the least, and placebo in between. Ss were exposed to 1 of 2 situations, fearful or nonfearful. In the fearful situation the adrenalin injected Ss were most frightened, the chlorpromazine least. In the nonfearful situation, the drug groups manifested no differential fright. (15 ref.)—*Journal abstract.*

7773. Spear, Norman E., & Hill, Winfred F. (Northwestern U.) **Methodological note: Excessive weight loss in rats living in activity wheels.** *Psychol. Rep.*, 1962, 11(2), 437-438.—Of 2 groups, of 15 rats each, placed on a 24-hr. feeding schedule, the group living in activity wheels lost significantly more weight than the group in regular living cages. This differential weight loss "has confounded any conclusion regarding the effects of combining activity drive with hunger drive and thus serves as a warning for future experiments in this area."—B. J. House.

7774. Wendt, Richard H., Lindsley, David F., Adey, W. Ross, & Fox, Stephen S. (U. California, Los Angeles) **Self-maintained visual stimulation in monkeys after long-term visual deprivation.** *Science*, 1963, 139 (Whole No. 3552), 336-338.—New-born monkeys reared in darkness for 16 mo., except for daily 1-hr. periods of exposure to unpatterned light, were allowed to press a lever to obtain unpatterned light. The animals showed apparently insatiable responding, at rates that were extremely high as compared with rates for normally reared control animals.—*Journal abstract.*

SENSORY PROCESSES

7775. Carr, W. J., & Caul, W. F. (Bucknell U.) **The effect of castration in rat upon the discrimination of sex odors.** *Anim. Behav.*, 1962, 10(1-2), 20-27.—A 2-choice discrimination apparatus presented odors from receptive or nonreceptive females adjacent to a functioning or nonfunctioning water bottle. Estrous was induced in the discriminanda by injections of estradiol, and tested for by placing them with vigorous males. 4 normal and 6 prepuberally castrated males came to discriminate between the odors 80% of the time and returned to a chance level when the discriminanda received no injections. Similarly, normal and ovariectomized females discriminated between odor of normal vs. castrated male. "Under the present conditions of measurement, both the rate at which the olfactory discrimination was established and the accuracy of the discrimination were independent of the gonadal state of both male and female rat."—W. J. Coppock.

7776. Falk, John L., & Titlebaum, Libby F. (Harvard School Public Health) **Saline solution preference in the rat: Further demonstrations.** *J. comp. physiol. Psychol.*, 1963, 56(2), 337-342.—A proposal of Deutsch and Jonest, explaining the rat's preference for hypotonic and isotonic NaCl solutions as an artifact proceeding from the reduced electrophysiological "water signal" generated by these solutions, was tested. The results of the brief-exposure preference test under water-deprivation and nondeprivation conditions, consecutive-fluids, and simultaneous-fluids acceptance tests failed to confirm their hypothesis. The preference for saline over water was demonstrated in 10 out of 11 nondeprived Ss. In the consecutive- and simultaneous-fluids acceptance tests,

the acceptability of saline over water was shown to increase progressively over testing sessions under water-deprivation conditions. (18 ref.)—*Journal abstract*.

7777. Hack, Martin H. (New York U. School Medicine) **Signal detection in the rat.** *Science*, 1963, 139(Whole No. 3556), 758-760.—An auditory detection experiment was performed with rats as Ss, and the data were analyzed with a signal detection model. Rats were run at fixed sound pressure levels, and their responses were partitioned so that operating characteristics could be constructed. Measures of detectability, $(d_e)^{\frac{1}{2}}$, were calculated from the operating characteristics, and show that $(d_e)^{\frac{1}{2}}$ is a function of sound pressure levels, rising as these levels rise.—*Journal abstract*.

7778. Hoshishima, Keiichiro; Yokoyama, Sada-suke, & Seto, Katsuo. (Fukushima Medical Coll., Japan) **Taste sensitivity in various strains of mice.** *Amer. J. Physiol.*, 1962, 202(6), 1200-1204.—Taste sensitivity for NaCl, saccharine, acetic acid, and phenylthiocarbamide was measured in 3 white and 3 black strains of mice and in mice with glandular malfunction. A white strain showed lowest thresholds for all substances, and a black strain showed the highest. White strains had generally lower thresholds except in the case of saccharine. Cauterization of the suprarenal body raised the threshold for acetic acid, but the other thresholds were unchanged. Reduction of thyroid and hepatic functions raised thresholds for all substances but NaCl.—*D. R. Peryam*.

7779. Jacobs, Gerald, H. (Indiana U.) **Spectral sensitivity and color vision of the squirrel monkey.** *J. comp. physiol. Psychol.*, 1963, 56(3), 616-621.—Psychophysical measures of visual function were obtained from 5 squirrel monkeys. Measurements of luminosity functions, Purkinje shift, neutral points, and Rayleigh match points were obtained in a 4-choice discrimination set-up. For this species, it was found that: (a) a Purkinje shift is easily demonstrated; (b) the photopic luminosity function has a peak within the range of the normal O but shows a relative sensitivity depression in the red and a sensitivity enhancement in the blue; (c) there is no true spectral neutral point, although there are discrimination losses at 480-495 μ , and (d) more red is required for a Rayleigh match than the normal O requires. It was concluded that protanomaly is characteristic of color vision in this species. (15 ref.)—*Journal abstract*.

7780. Kay, L. (U. Birmingham) **A plausible explanation of the bat's echo-location acuity.** *Anim. Behav.*, 1962, 10(1-2), 34-41.—A pulsed frequency modulation system is discussed as a possible basis of echo-location. The system creates difference frequencies in the bat's ears which are a function of bearing. These beats are generated when the reflected FM signals received by the ears are compared with a postulated low level repeat sweep generated by the bat whenever an echo he attends to is received. Such a system avoids the problems of extreme bandwidth required in time difference systems and is compatible with the performance of bats in the presence of masking noise.—*W. J. Coppock*.

7781. Martin, Paul; Romba, John J., & Gates, Hugh W. **A method for the study of hearing loss and recovery in rhesus monkeys.** *USA ordn. Hum.*

Engng. Lab. tech. Memo., 1962, No. 11-62. v, 31 p.—A method is described for the rapid and reliable measurement of the Rhesus monkey's auditory acuity. This method proved suitable for determining the animal's hearing loss and subsequent recovery. 2 important factors of the method were: (a) the controlled presentation of the pure tone stimulus through earphones which are affixed to the animal by means of a newly developed phone holding device, and (b) the provision for obtaining a clearly defined indicator response. The method was evaluated in terms of the exposure of a monkey to 1 gun-generated noise impulse. Post-exposure audiograms were obtained rapidly and without difficulty.—*USA OHEL*.

7782. Parriss, J. R. (University Coll., London, England) **Visual discrimination in the toad.** *Quart. J. exp. Psychol.*, 1963, 15(1), 13-21.—Using a method of successive discrimination, 10 toads (*Bufo bufo*), were trained to discriminate between horizontal and vertical rectangles each 5.0 \times 7.5 cm. After training, one optic nerve was severed in certain animals and the stumps pushed well apart to delay regeneration. The nonoperated animals retained their learning over the rest-period of 10 weeks at a level similar to training. The animals with 1 eye showed considerably less retention than the nonoperated animals.—*Journal abstract*.

7783. Rushforth, Norman B., Burnett, Allison L., & Maynard, Richard. (Western Reserve U., Cleveland, O.) **Behavior in Hydra: Contraction responses of Hydra pirardi to mechanical and light stimuli.** *Science*, 1963, 139(Whole No. 3556), 760-761.—Hydra pirardi contracts in response to light and mechanical agitation. The animals show a reduction in the number of contractions in response to mechanical agitation on repeated testing but continue to contract in response to a light stimulus. Excision of all the tentacles of the animal completely inhibits contraction in response to mechanical agitation but does not affect contraction in response to light. The results of these experiments suggest that Hydra pirardi has different receptors for light and for mechanical agitation and that the control mechanisms for the contraction responses to these 2 stimuli are independent.—*Journal abstract*.

7784. Shinkman, Paul G. (U. Michigan) **Visual depth discrimination in animals.** *Psychol. Bull.*, 1962, 59(6), 489-501.—"The capacity to react discriminatively to the distance of visual stimulus appears to characterize a great many species, ranging from insects to primates. Especially in the case of insects, birds, and rats, it is evident that displacement of the images on the retinal mosaic is a very important factor in depth discrimination."—*W. J. Meyer*.

7785. Tigner, James R., & Besser, Jerome S. (Wildlife Research Cent., Denver, Colo.) **A quantitative method for evaluating chemicals as rodent repellants on packaging materials.** *J. agr. food Chem.*, 1962, 10(6), 484-486.—An index of repellancy (R_{50}) is defined as the amount (mg. per square in.) of chemical applied to burlap bags that will deter 50% of hungry test animals (house mice) from penetrating to reach food for a period of 16-18 hours. All test animals were prequalified by penetrating untreated burlap in 2 consecutive exposures. Bags representing a log series of concentrations were prepared and each level was exposed to 10 animals. Using an adaptation

of the Litchfield-Wilcoxon method for determining dose-effect measurements, 3-7 concentrations required statistically to determine the R_{50} and its 95% confidence limits.—D. R. Peryam.

7786. Warren, Roslyn P. (Shimer Coll.) **Preference aversion in mice to bitter substance.** *Science*, 1963, 140 (Whole No. 3568), 808-809.—Preference-aversion functions demonstrable for sweet and salty stimuli have been found for a "bitter" substance, sucrose octaacetate, at individually specific concentrations for mice. The data support Schneirla's views correlating stimulus magnitudes and approach-withdrawal. The positive reinforcing value of this bitter substance as a weak stimulus is diminished with continuous exposure and no secondary reinforcement. Avoidance is related to intensity of stimulation rather than modality or postingestion effects.—*Journal abstract*.

7787. Young, Paul Thomas, & Schulte, Richard H. (U. Illinois) **Isohedonic contours and tongue activity in three gustatory areas of the rat.** *J. comp. physiol. Psychol.*, 1963, 56(3), 465-475.—Preferences were determined by recording tongue contacts with test fluids using subthreshold electrical currents. The up-and-down psychophysical method was used to determine hedonic equality between standard and comparison solutions. Preferences were observed and isohedonic contours plotted in 3 stimulus areas—sour-sweet, salt-sweet, bitter-sweet—for a group of 30 nondeprived rats. Low concentrations of the non-sweet solute may facilitate tongue activity relative to sucrose standard. With high concentrations in all 3 stimulus-areas activity was inhibited. The study shows that points along an isohedon are not equal in activating potential but that standard and comparison solutions are equally activating at a particular point within a stimulus area. The characteristics of isohedons are considered.—*Journal abstract*.

LEARNING

7788. Coppock, H. W., Meeks, W. A., & Huard, D. V. **Drug and strain effects of performance and reversal of a head-position habit.** (Arizona State U.) *J. comp. physiol. Psychol.*, 1963, 56(3), 551-557.—Drug effects on conditioning and extinction may be secondary consequences of effects on probability of errorless response (p) and probability of the pattern of error-plus-correction. A factorial design employed 112 rats to test effects of 7 Drugs, 2 Strains, 2 Dosages, and 2 Delays of reinforcement upon shock escape conditioning in a 2-choice situation. Mean rate of reversal learning (θ) was lowest under the drugs yielding the highest p during prereversal trials ($r = -.61$) and during the intertrial periods ($r = -.75$). Morphine increased p , presumably reducing stimulus variability by inhibiting peristaltic movements and minimizing error-plus-correlation prereversal trials. Hence reversal learning started with a weaker pattern, which during reversal was, by definition, a pattern of correct (plus-intertrial-response-toward-opposite-side). The effect of delay on drug groups is consistent with this hypothesis of a pattern of alternation. (16 ref.)—*Journal abstract*.

7789. Cotton, John W., & Jensen, Glen D. (U. California, Santa Barbara) **Successive acquisitions and extinctions in a T maze.** *J. exp. Psychol.*, 1963, 65(6), 546-551.—80 male albino rats received 20

trials of noncorrection training in a single unit T maze. Then randomly assigned groups of 20 Ss received 2 sessions of training including from zero to 2 acquisition sessions and the remainder of extinction sessions (in all 4 possible orders) after which all groups received an additional acquisition session and then a session of extinction. No evidence was found of inferior performance on Days 4 and 5 for groups receiving previous extinction trials. When groups were compared on trials for which previous numbers of reward were equated, there was some indication of superiority for groups having extinction trials on Days 2 and/or 3.—*Journal abstract*.

7790. Hill, Winfred F., & Spear, Norman E. (Northwestern U.) **A replication of overlearning and reversal in a T maze.** *J. exp. Psychol.*, 1963, 65(3), 317.—Rats were trained to criterion in a T maze and then given reversal training either with or without 140 trials of overtraining (16 Ss per group). The overtrained group required significantly more trials to reach the reversal criterion.—*Journal abstract*.

7791. Hiss, Richard H., & Thomas, David R. (Kent State U.) **Stimulus generalization as a function of testing procedure and response measure.** *J. exp. Psychol.*, 1963, 65(6), 587-592.—36 homing pigeons received 10 days of VI training with a CS of 550 $m\mu$ and then were tested for generalization in extinction. Group 1, Group 2, and Group 3 ($n = 9$ each) were run to a criterion of extinction at 550, 530, and 510 $m\mu$, respectively. Group 4 ($n = 9$) received a random presentation of the 3 stimuli for 1 hr. For all Ss during both training and testing 30-sec. stimulus-on periods were alternated with blackout periods of 10 sec., thus creating discrete trials. The measures employed were: number of responses on the 1st test trial, total responses to extinction (or during the test), latency of the 1st response during the 1st 5 trials to which responding occurred, and rate of responding during the 1st 5 trials to which responding occurred. For each measure a gradient was obtained from Group 4 and from the combination of Groups 1, 2, 3, each of which contributed 1 point to the curve. It was found that the comparison of stimuli during testing is neither essential for the creation of a reliable gradient nor is it effective in altering the resulting gradient in any consistent way.—*Journal abstract*.

7792. Kirk, Kathleen L., & Bitterman, M. E. (Bryn Mawr Coll.) **Habit reversal in the turtle.** *Quart. J. exp. Psychol.*, 1963, 15(1), 52-57.—2 groups of mature "painted" turtles were trained in a T maze. 1 group had 5 trials per day, with correct and incorrect turns reversed for each animal whenever it reached the criterion of 5 errorless trials on a given day. The 2nd group had 10 trials per day, with correct and incorrect turns reversed daily, irrespective of the performance of the animals. Only in the data for the 2nd group did there appear some indication of progressive improvement in habit reversal. The results are considered in relation to those obtained in analogous experiments with other species.—*Journal abstract*.

7793. Lockard, Joan S. (U. Wisconsin) **Choice of a warning signal or no warning signal in an unavoidable shock situation.** *J. comp. physiol.*

Psychol., 1963, 56(3), 526-530.—To test whether a warning signal followed by unavoidable shock becomes aversive, rats were tested individually in a 2-compartment grid shuttle box. Ss could run freely through interconnecting doors, but could not escape shock since the grid floors of both compartments were electrified simultaneously on every acquisition trial. A stimulus light came on in 1 chamber 5 sec. prior to shock for experimental Ss and at random times between shocks for control Ss. After acquisition, both groups were given extinction with only light and no shock. Control Ss spent about 50% of the trials in each compartment under both conditions. Experimental Ss eventually spent 90% of the trials during acquisition in the compartment with the warning light but only 50% late in extinction.—*Journal abstract.*

7794. McAllister, Wallace R., & McAllister, Dorothy E. (Syracuse U.) Increase over time in the stimulus generalization of acquired fear. *J. exp. Psychol.*, 1963, 65(6), 576-582.—Following classical fear conditioning, Ss were trained to jump a hurdle to escape the fear-eliciting stimuli. 2 groups were conditioned in the start box of the hurdle apparatus (Same CB) and 2 in a separate, but similar, conditioning box (Diff CB). Under each condition, 1 group had hurdle training after a 3-min., and the other, after a 24-hr., postconditioning delay. For the 2 Diff CB groups, hurdle training involved a generalized stimulus situation. All groups, except Group 3 min.-Diff CB, learned to jump the hurdle in 25 trials. The significant improvement in performance with an increase in postconditioning delay under the Diff CB, but not under the Same CB, condition was attributed to an increase in the strength of the fear response over time to generalized, but not to the original, stimuli.—*Journal abstract.*

7795. McDowell, A. A., & Brown, W. Lynn. (U. Texas) The learning mechanism in response shift learning set. *J. comp. physiol. Psychol.*, 1963, 56(3), 572-574.—12 male and 6 female rhesus monkeys were trained for 44 days on response shift learning set. For the next 8 days under Procedure A the object responded to on the initial trial was aired with a novel stimulus object and response to the novel stimulus object was rewarded, while under Procedure B the object not responded to on the initial trial was paired with a novel stimulus object and response to the object not responded to on the initial trial was rewarded. Analysis of results during the last 8 days of testing showed beyond the .001 significance level that the prepotent mechanism of learning in response shift learning set is behavioral inhibition of response to previously rewarded cues.—*Journal abstract.*

7796. Pieper, W. A., Garwood, Carolyn; Lewis, Donna, & Marx, Melvin H. (U. Missouri) Differential acquisition of an instrumental response in albino and hooded rats. *Psychol. Rep.*, 1962, 11(2), 425-426.—"Two groups of hooded and two groups of albino rats [N = 24] were harpress-trained, using 32% and 8% sucrose as reinforcer. While there was no statistically reliable interaction of Concentration by Strain, the effects of Strain, Trials, and Strain by Trials were reliable at the .01 level. These differences were interpreted as supporting the need for more thorough comparative investigations when dealing with complex interacting variables."—B. J. House.

7797. Putnam, C. D. (Cambridge U., England) The non-random behaviour of *Alleochara bilineata* Gyll. (Coleoptera: Staphylinidea) in a Y-maze with neither reward nor punishment in either arm. *Anim. Behav.*, 1962, 10(1-2), 118-125.—Over ½ of 72 adults showed a significant preference for a given side when given 20 consecutive choices in an initially washed and dried maze. The group showed equal left and right preferences. If alternation appeared on the 1st 2 trials, no preference for either side was shown on the 3rd. Possible explanations are considered and examples of similar behavior in other animals discussed.—W. J. Coppock.

7798. Schusterman, Ronald J., & Bernstein, Irwin S. (Yerkes Lab. Primate Biology) Response tendencies of gibbons in single and double alternation tasks. *Psychol. Rep.*, 1962, 11(2), 521-522.—Gibbons (N = 9) trained with either single alternation (SA) or double alternation (DA) of correct position remained at chance performance. Response tendencies of the SA animals shifted from position preference to response alternation while the DA animals persisted in position preference responses. Introduction of an object discrimination problem on alternate trials for 3 SA trained animals had no effect on alternation performance.—B. J. House.

7799. Smith, Jerome. (U. Connecticut) Tests of a transfer theory of alternation behavior. *Psychol. Rep.*, 1962, 11(2), 583-599.—In 5 experiments, alternation of rats (N = 87) on a T maze was measured after a variety of rearing procedures as a test of the hypothesis that alternation is related to the negative correlation in the environment between places recently visited and presence of food. Positive evidence was found in 1 experiment which showed more alternation in rats reared with scattered food than those reared with food always in 1 place, but a 2nd experiment failed to replicate these results. As negative evidence, no difference was found between rats running for food reward and those running for water although food was scattered and water always in the same place in the living cages. Other negative evidence was a failure to find less alternation among rats reared with a correlation between exploration within the living cage and shock. From these and other findings, the conclusion is drawn that "the evidence does not warrant . . . the substitution of transfer of training for any of the process explanations of alternation."—B. J. House.

7800. Thompson, Merrell E. (New Mexico State U.) Stimulus alternation, response repetition, and response alternation in a multiple-choice situation. *Psychol. Rep.*, 1962, 11(2), 523-527.—"Two groups of rats (one reinforced and one not reinforced) [N = 54] were given two daily trials for 12 days in a new type maze designed to separate response alternation and response repetition from stimulus alternation. Neither group alternated stimuli above chance. While the behavior of the nonreinforced Ss showed little change over the 12 days, reinforced Ss showed an increasing and significant response repetition and a decreasing tendency to alternate responses. The results indicate that perhaps a more appropriate explanation of Ss' behavior in the Cross T-maze may be in terms of response repetition rather than stimulus alternation."—B. J. House.

Conditioning

7801. Brimer, Charles J., & Kamin, Leon J. (McMaster U.) **Disinhibition, habituation, sensitization, and the conditioned emotional response.** *J. comp. physiol. Psychol.*, 1963, 56(3), 508-516.—The effect of prior unsignaled shock (preshock) on subsequent acquisition of an Estes-Skinner conditioned emotional response (CER) was explored in 80 rats. Preshock retarded acquisition of CER, but this was not attributable to habituation to the US; rather, preshock produced a tendency for S to accelerate responding in the presence of the CS. This tendency was related to the intensity of preshock, but varying preshock intensities affected baseline rates of operant behavior. Preshock did not influence CER acquisition when S was allowed to recover to its baseline rate of operant responding prior to CER training. Data were interpreted in terms of Pavlovian disinhibition. There was some evidence for a sensitizing effect of preshock.—*Journal abstract.*

7802. Griffard, C. D. (U. Pittsburgh) **Classical conditioning of the planarian *Phagocata gracilis* to water flow.** *J. comp. physiol. Psychol.*, 1963, 56(3), 597-600.—In an attempt to determine whether or not planaria can be conditioned, 40 planaria, *P. gracilis*, were studied. The experimental group received 250 pairings of water flow (CS) and shock (US). A shock control group received 250 exposures to the US and a flow control group received 250 exposures to the CS. A 3rd control group received no training but was tested in the same manner as the other groups. All Ss of a specific group were given 25 test exposures to the CS from 10-15 hr. after training. The difference in the performance of the experimental group as compared with all other groups was significant at the .005 level. Additional evidence indicated that some sensitization may have occurred in the shock control group. The extent to which sensitization influenced the results for the experimental group is uncertain and therefore an interpretation in favor of classical conditioning is considered equivocal.—*Journal abstract.*

7803. Jarrard, Leonard E. (Washington & Lee U.) **Effects of X irradiation operant behavior in the rat.** *J. comp. physiol. Psychol.*, 1963, 56(3), 608-611.—2 groups of 24 rats each were trained to press a bar, one for food and one to avoid shock. After considerable training, each group was divided into 4 equated subgroups that were exposed to 0, 100, 300, and 500 r., respectively. Performance of Ss in the shock avoidance situation did not change after irradiation but performance of Ss working for food was affected. In a food consumption study using the same X irradiation levels as the operant behavior study, significant changes in food consumption were obtained at lower radiation levels than those needed to cause significant changes in bar pressing for food. At the higher radiation levels significant changes in food consumption persisted longer than changes in operant behavior.—*Journal abstract.*

7804. Kamin, Leon J., & Schaub, Ronald E. (McMaster U.) **Effects of conditioned stimulus intensity on the conditioned emotional response.** *J. comp. physiol. Psychol.*, 1963, 56(3), 502-507.—Effects of CS intensity on conditioned emotional response (CER) were explored with 38 rats. CS was white noise. The 1st study, with a delayed condition-

ing procedure, produced a positive monotonic function relating conditioning to CS intensity. When extinction was explored with a factorial design (to separate learning from performance), the only effect was a generalization decrement; changing CS intensity accelerated extinction. The 2nd study, with a trace conditioning procedure, resulted in complete suppression to the trace of an intense CS. There was no conditioning to the trace of the same weak CS which produced a CER under delayed conditioning. Trace conditioning seems to depend on the magnitude of a decaying neural trace, itself a positive function of CS intensity.—*Journal abstract.*

7805. Kamin, Leon J. (McMaster U.) **Backward conditioning and the conditioned emotional response.** *J. comp. physiol. Psychol.*, 1963, 56(3), 517-519.—Previous research (Singh, 1959) had indicated very successful backward conditioning of a conditioned emotional response (CER). This result cast grave doubt on the use of the CER for the analysis of Pavlovian conditioning. 2 studies are reported which find no evidence for a backward CER. Re-examination of the earlier data indicated a fundamental procedural variation which separates Singh's work from other CER studies. The CER proper still serves for the analysis of Pavlovian conditioning.—*Journal abstract.*

7806. Klinman, Cynthia S., & Bitterman, M. E. (Bryn Mawr Coll.) **Classical conditioning in the fish: The CS-US interval.** *J. comp. physiol. Psychol.*, 1963, 56(3), 578-583.—Prompted by discrepant earlier findings, 3 experiments were conducted on the role of the CS-US interval (0.5, 2.0, or 4.0 sec.) in the classical conditioning of fish—1 with 54 *Mollies* given massed training (1.5 min. between trials), a 2nd with 54 *Mollies* given more spaced training (4 min. between trials), and a 3rd with goldfish given massed training. Probability and magnitude of response to the CS declined from a maximum at 0.5 sec. in the 1st experiment, but were not significantly related to the CS-US interval in the other 2. Latency of response was least at the 0.5-sec. interval in each case. The results are consistent with the Pavlovian interpretation of delayed conditioning.—*Journal abstract.*

7807. Reynolds, Herbert H. (Baylor U.) **Effect of rearing and habitation in social isolation on performance of an escape task.** *J. comp. physiol. Psychol.*, 1963, 56(3), 520-525.—20 rats were raised in isolation and 20 in a state of companionship (matched litter mates). During performance of an escape task immediately following learning, the 2 groups of Ss differed at the .01 level. When 10 Ss from each group were changed to the opposite social state, performance of Ss reared as companions did not change significantly, while performance of Ss reared as isolates improved to a statistically significant extent. Upon return to the state of rearing, Ss reared as companions showed no change in performance; conversely, those Ss reared in isolation showed a significant decrement. Weight differences of the 2 groups were reversed during experimentation, indicating the toll of continued stress in the case of experimental isolates.—*Journal abstract.*

7808. Segal, Evalyn F., & Holloway, Stephen M. (San Diego State Coll.) **Timing behavior in rats with water drinking as a mediator.** *Science*, 1963,

140 (Whole No. 3569), 888-889.—Rats, reinforced for spacing their responses 20 sec. apart, used water-drinking as a means of "pacing" their response rate. "Timing" may be based on mediating response sequences such as drinking.—*Journal abstract.*

7809. Shafer, James N., & Corman, Charles D. (West Virginia U.) **Response of planaria to shock.** *J. comp. physiol. Psychol.*, 1963, 56(3), 601-603.—The study investigated the relationship between CRs of planaria as described in previous conditioning experiments and orienting response of planaria in an electrical field. 2 groups of 10 Ss were subjected to either a 12 ma. or a 28 ma. shock. The response of the planaria, either cephalic turning or longitudinal contraction, was found to be a function of the head orientation in regard to the polarity of the electrodes, although the responses were more difficult to discriminate in the high intensity group. The differential use of the 2 responses as URs was suggested, as well as the need for a clearer understanding of the mechanisms underlying the responses.—*Journal abstract.*

7810. van Sommers, Peter. (Harvard U.) **Air-motivated behavior in the turtle.** *J. comp. physiol. Psychol.*, 1963, 56(3), 590-596.—Immature turtles were trained to depress a lever to secure air while submerged in water. Rate of responding was inversely related to duration of exposure to air following each response. Periodic extinction produced a decline in rate during extinction and compensatory increases during continuous reinforcement. Ss responded less for air containing 10% carbon dioxide. Rate of responding increased when Ss' diets were augmented with uncooked meat, and there was an increase by a factor of approximately 2 in the rate of lever pressing with a 10° C. rise in temperature. This latter phenomenon may be mediated by direct effects of temperature on external respiration, but is probably not related to change in uptake of oxygen from water immersing Ss.—*Journal abstract.*

Discrimination

7811. Bradley, Jack I., & George, Ronald J. (Long Beach State Coll.) **Conditions influencing latent learning.** *Psychol. Rep.*, 1962, 11(2), 499-505.—51 rats were trained on a T maze under water deprivation with water on both sides and food on one side. After 24 or 48 trials under water deprivation, Ss were given discrimination training under food deprivation. $\frac{1}{2}$ the rats had drive discrimination training in a Skinner box prior to the water deprivation trials. A control group of 14 rats received only discrimination training under hunger drive. "When 24 and 48 trial groups were compared in terms of proportions of correct responses on the first critical trial significant differences were found, demonstrating learning by the 24-trial group only. When the effect of drive discrimination training was considered, the differences were significant for the 24-trial groups. It was also found that the pretrained 24-trial group learned in significantly fewer trials than the other groups."—B. J. House.

7812. Cross, Henry A., & Rankin, Richard J. (Oklahoma State U.) **Tactile generalization in the rat.** *Psychol. Rep.*, 1962, 11(2), 343-346.—"Sixty rats were given training under 22-hr. water deprivation in a straight alley covered with 100-grit emery

cloth. Subsequently, 20 Ss each were extinguished in alleys covered with 60-grit, 100-grit, and 150-grit emery cloth, respectively. Although the predicted generalization was observed, it was transitory in its effect, reaching its maximum level on extinction Trial 4."—B. J. House.

7813. Ganz, Leo. (U. Chicago) **Effect of an anchor stimulus on the stimulus generalization gradient.** *J. exp. Psychol.*, 1963, 65(3), 270-279.—Rhesus macaques were trained to press a key differentially to 2 monochromatic hues 150 m μ apart in wave length. The stimuli were presented through contact lens diffusers. S^a was presented under a 15-sec. variable interval schedule of positive reinforcement (5% sucrose solution) and S^a was presented under a 15-sec. delay-of-reinforcement schedule. Generalization was measured to the intervening hues, covered in 20-m μ steps. The generalization testing was preceded by 1 hr. of stimulus exposure and a 10-min. period of dark adaptation. During stimulus exposure, Ss sat in the primate chair, head restrained, wearing the contact lens diffusers, and exposed to a repeating cycle of hues. It was found that when stimulus exposure consisted of colors within 20 m μ above and below S^a, response rate during generalization testing was consistently enhanced at S^a.—*Journal abstract.*

7814. Hoffman, Howard S., & Fleshler, Morton. (Pennsylvania State U.) **Discrimination and stimulus generalization of approach, of avoidance, and of approach and avoidance during conflict.** *J. exp. Psychol.*, 1963, 65(3), 280-291.—1 group of rats was trained on approach (plate press to obtain food), a 2nd group was trained on avoidance (bar press to prevent shock), and a 3rd group was trained on both responses. For all 3 groups the discriminative stimulus was a 3500-cps tone. During subsequent tests for stimulus generalization, it was found that approach generalized more broadly than avoidance, but Ss learned to discriminate more rapidly for approach than for avoidance. In the tests during approach-avoidance conflict (Group 3), displacement was observed despite the fact that the gradient of approach was higher everywhere than the gradient of avoidance. While the results conform to certain features of Miller's theory of displacement, they also indicate the need for revisions. In particular, they suggest that conditioned suppression plays an important role in determining behavior during conflict.—*Journal abstract.*

7815. Kalish, Harry I., & Haber, Audrey. (State U. New York, Long Island Cent.) **Generalization: I. Generalization gradients from single and multiple stimulus points. II. Generalization of inhibition.** *J. exp. Psychol.*, 1963, 65(2), 176-181.—35 pigeons were trained to peck at a monochromatic stimulus of 550 m μ . Ss were then assigned to a group and extinguished to one of the following stimuli: 550, 540, 530, 520, 510, and 490 m μ . on each of 2 successive days. Gradients of generalization (single stimulus) from the mean total number of responses during extinction, were contrasted with a comparable gradient from Guttman and Kalish (1956) in which Ss sampled over the entire range of stimuli (multiple stimulus). The gradients showed marked differences which were discussed. Postextinction gradients were obtained for the 2nd part of the study by permitting

Ss to sample over the range of stimuli from 510 to 550 in 10-m μ . steps (including 490 m μ). The obtained gradients were compared with gradients generated from a "mirror-image" hypothesis of generalized inhibition. Certain marked discrepancies were observed between the predicted and obtained gradients which were supported by other studies of generalization inhibition.—*Journal abstract.*

7816. Kehoe, Jacsue. (Brown U.) Effects of prior and interpolated learning on retention in pigeons. *J. exp. Psychol.*, 1963, 65(6), 537-545.—A discrimination situation was developed for pigeons which would permit the investigation of retention problems in the animal laboratory. Changes in Retroactive and Proactive Inhibition (RI and PI) were studied as a function of the length of the retention interval (1, 10, or 30 days). A 5-key discrete-trial situation was employed in which a task was defined by the key color that was associated with reinforcement. Comparison of the number of correct responses made by the various groups on Day 1 of relearning permits the following conclusions: (a) Retroactive Inhibition was very prominent at all retention intervals. (b) The RI Ss relearning after a 30-day interval performed better than those relearning after a 1- or 10-day interval. (c) Ss learning an additional task prior to the task to be recalled made as many correct responses during the retention test as did control Ss. That is, no Proactive Inhibition was evident. (d) Both PI and control Ss relearning after a 30-day interval performed more poorly at recall than did those Ss relearning after a 1- or 10-day interval—a trend opposite to that shown by the Ss in the RI condition. A supplementary experiment showed that even when the number of prior tasks was increased from 1 to 2, no PI was evident after a 30-day interval—the only interval tested under this special interference condition.—*Journal abstract.*

7817. Michels, K. M., Pittman, G. G., Hitchcock, L., Jr., & Brown, D. R. (Purdue U.) Visual discrimination: Tree squirrels and quantified stimulus dimensions. *Percept. mot. Skills*, 1962, 15(2), 443-450.—This study was concerned with the perceptual learning ability of the tree squirrel and the relative discrimination difficulty for planar figures as a function of their physical dimensions. A modification of the Wisconsin General Test Apparatus and 12 animals representing 2 species of tree squirrels were used. Patterns with 4 sides proved most difficult, those with 5 sides were of medium difficulty, and those with 6 and 7 sides were easier. A correlation analysis indicated that areal symmetry and axial rotation were also important figure dimensions for discrimination.—*W. H. Guertin.*

7818. Pavlik, William B., & Born, David G. (Rutgers U.) Partial reinforcement effects in selective learning. *Psychol. Rep.*, 1962, 11(2), 575-580.—"Four groups of albino rats [$N=40$] were given 180 training trials in a brightness discrimination task [in a Y-maze] under four different schedules of reinforcement of the two responses: 100:0, 100:50, 50:0, and 67:33. Free and forced trials were employed such that each S made an equal number of positive and negative responses. Following training, 60 free extinction trials were given. Analyses of choice data from free trials indicate that the 100:0 group made significantly more positive responses than any

of the partial reinforcement groups during both training and extinction. When extinction performance was corrected for differences in training level, no group differences and no significant decrements in choice performance occurred during the extinction period. Possible effects of training differences in relative frequencies of negative responses upon subsequent extinction performance were suggested."—*B. J. House.*

7819. Thompson, Merrell E. (New Mexico State U.) Stimulus generalization of an instrumental response learned under distributed practice. *Psychol. Rep.*, 1962, 11(2), 471-476.—"One group of 80 white rats was trained to open a door in the center of a white circle, 20 sq. cm. in area. Subgroups of 20 were then given 40 extinction trials on circles of 20, 32, 50, and 79 sq. cm. Another group of 80 rats were trained on the 79-sq. cm. circle and subgroups were tested on circles of 79, 50, 32, and 20 sq. cm. Three measures of stimulus generalization were applied. None of the measures yielded gradients showing decreasing amount of generalization as a function of difference in size of test stimulus from training stimulus." Results are contrasted with those from a similar study by Grice and Saltz showing generalization gradients following massed trials.—*B. J. House.*

Avoidance

7820. Brush, F. Robert; Myer, James S., & Palmer, Michael E. (U. Pennsylvania) Effects of kind of prior training and intersession interval upon subsequent avoidance learning. *J. comp. physiol. Psychol.*, 1963, 56(3), 539-545.—4 experiments, which used shuttle box avoidance training of rats, were conducted to isolate the antecedent conditions that produce the U shaped relation between relearning of an incompletely learned avoidance response and intersession interval. In Experiment 1 the relation was confirmed. Experiment 2 showed that the shock stress of original avoidance training is insufficient to produce the U shaped relation. Experiment 3 demonstrated that instrumental avoidance responding is not a necessary condition for the occurrence of the U shaped relation, and suggested that fear conditioned to the CS is the principal controlling factor. Experiment 4 showed that pseudoconditioning is not sufficient to account for these results. An interpretation postulating a "parasympathetic overreaction" following fear conditioning was offered.—*Journal abstract.*

7821. Busch, R. D., Rholes, F. H., Jr., Reynolds, H. H., & Koestler, F. G. The relationship between skin temperature and performance in the Java monkey. *Holloman USAF ARL tech. Docum. Rep.*, 1962, No. 62-21. vi, 13 p.—4 male Java monkeys (macaque iris), trained to perform a continuous avoidance task, were used in an exploratory study of diurnal skin temperature changes and their relationship to avoidance behavior. Significant diurnal skin temperature changes were detected, and a relationship with performance was shown to exist.—*USAF ARL.*

7822. Halas, Edward S., Mulry, Ray C., & DeBoer, Margaret. (U. North Dakota) Some problems involved in conditioning planaria: Electrical polarity. *Psychol. Rep.*, 1962, 11(2), 395-398.—"Twenty planaria were randomly divided into two

groups and then trained in a narrow trough to approach a non-preferred light. Electrodes were mounted at each end of the trough. For Group I, the electrode at the right end was always negative whereas, for Group II, the electrode at the right end was always positive. Planaria were found to be more sensitive to an electrical current when they were approaching the anode as compared to when they were approaching the cathode. Sensitivity was measured by the number of electrical shocks and time required to induce the planaria to reverse their direction of travel. The findings suggest that one or more variables are not properly controlled in studies attempting to condition planaria."—B. J. House.

7823. Kamin, L. J., Brimer, C. J., & Black, A. H. (McMaster U.) Conditioned suppression as a monitor of fear of the CS in the course of avoidance training. *J. comp. physiol. Psychol.*, 1963, 56 (3), 497-501.—2 studies monitored with an independent measure fear of the CS during acquisition and extinction of a shuttle-box avoidance response by rats. Rats were first trained to bar press in a Skinner box, then subgroups were trained to various criteria of acquisition and extinction of avoidance; finally the suppressant effect of CS presentation in the Skinner box was observed. The technique yielded a monotonic function relating fear of the CS to number of CS-US pairings. Prolonged extinction training of the avoidance response was associated with decreased fear of the CS, but Ss trained to a moderate extinction criterion were very fearful of the CS. The function relating fear to avoidance acquisition criterion was U shaped.—*Journal abstract*.

7824. Pearl, Jack, & Edwards, Robert E. (Sterling-Winthrop Research Inst.) Delayed avoidance conditioning: Warning stimulus (CS) duration. *Psychol. Rep.*, 1962, 11(2), 375-380.—"The hypothesis that long stimulus durations would facilitate the acquisition of discriminated avoidance behavior was tested, using 5 groups of 10 rats each in Skinner boxes. Experimental groups trained on a 20- or 60-sec. CS avoided significantly more frequently than did a 5-sec. group. But when the experimental groups were abruptly changed to a 5-sec. CS, their superiority disappeared. An additional group, gradually shifted from 60 to 5 sec., retained its superiority over a 5-sec. control group. These results, which are opposed to those obtained in shuttlebox avoidance experiments, are explained as attributable to an antagonism between shock-preparatory and lever-pressing responses which provide similar proprioceptive feedback."—B. J. House.

7825. van Sommers, Peter. (Harvard U.) Carbon dioxide escape and avoidance behavior in the brown rat. *J. comp. physiol. Psychol.*, 1963, 56(3), 584-589.—Rats were restrained in a small chamber through which various gas mixtures could be pumped. 3 rats were exposed to concentrations of carbon dioxide of 8%, 10%, and 15%. They successfully learned to escape regularly for 30-sec. periods by touching a metal tube. They were subsequently trained to avoid the onset of air containing similar carbon dioxide concentrations by pressing a panel. The functions relating response measures to concentrations were monotonic but curvilinear. The threshold for escape behavior appeared to be slightly below 8%.—*Journal abstract*.

7826. Wodinsky, Jerome; Behrend, Erika R., & Bitterman, M. E. (Lerner Marine Lab., Bimini, Bahamas) Avoidance-conditioning in two species of fish. *Anim. Behav.*, 1962, 10(1-2), 76-78.—Groups of goldfish and Beau Gregories were trained in a shuttle-box to avoid a shock when a light appeared in the compartment occupied by the fish. CS-US intervals ranged between 1.25 and 40 sec. Mean days to criterion of 9 avoidances increased progressively in both species as CS-US interval decreased, with the Beau Gregories but not the goldfish performing successfully at an interval of 1.25 sec. "It is noteworthy that at every CS-US interval, the species which learned more rapidly showed a higher latency of response on the criterion day."—W. J. Coppock.

Reinforcement

7827. Birch, David; Allison, James K., & House, Robert F. (U. Michigan) Extinction performance following discrimination training. *J. exp. Psychol.*, 1963, 65(2), 148-155.—The resistance to extinction of the positive stimulus in discrimination learning was evaluated in 2 experiments using rat and single stimulus presentation on an elevated runway. In Experiment I, discrimination groups received reinforcement to white and nonreinforcement to gray (WG) or black (WB). Reference groups received all trials to white under 100% (W+ and w+ which differ in number of trials) or 50% (W±) reinforcement. Both mean log speed of approach and parameter estimates from the extinction curves showed (Tukey tests) the extinction performance of the discrimination groups as more similar to W+ and w+ than to W±. Experiment II yielded comparable results for WG and WB for both the approach and an additional goal platform measure.—*Journal abstract*.

7828. Capaldi, E. J., & Stanley, Larry R. (U. Texas) Temporal properties of reinforcement aftereffects. *J. exp. Psychol.*, 1963, 65(2), 169-175.—Pattern running performance as a function of intertrial interval was investigated in 3 separate experiments which employed rats trained in a straight alley under alternating partial reinforcement. In the initial experiment speed of running on the nonreinforced trials late in training was equivalent for the 15-sec. and 20-min. intertrial interval groups, as it was for the 2-min. and 10-min. groups; however, the former groups, as it was for the 2-min. and 10-min. groups; however, the former groups ran more slowly on these trials than did the latter ones. Substantially similar results were obtained in the subsequent experiments. On the basis of these results the tenability of the Hull-Sheffield temporal assumptions was questioned and new temporal assumptions were advanced.—*Journal abstract*.

7829. Capaldi, E. J., & Wargo, Patricia. (U. Texas) Effect of transitions from nonreinforced to reinforced trials under spaced-trial conditions. *J. exp. Psychol.*, 1963, 65(3), 318-319.—2 groups of 11 rats each were trained to traverse a straight alley under partial reinforcement, the intertrial interval being 20 min. in acquisition and extinction. For Group SA (single alternation) the number of transitions from nonreinforced to reinforced trials was greater than for Group R (random training). Group SA was considerably more resistant to extinction than Group R. Since these results are consistent with

deductions available from the Hull-Sheffield hypothesis, it was concluded that they offer a basis for assuming that aftereffects remain functional for at least 20 min.—*Journal abstract.*

7830. Church, Russell M. (Brown U.) **Effect of relative skill on the amount of competitive facilitation.** *Psychol. Rep.*, 1962, 11(2), 603-614.—A study of "the effect of a competitive schedule of reinforcement on the response rate of rats in adjacent lever boxes. On the average of every 30 sec. a reinforcement became available, and the first of 2 experimental Ss to make a response in a lever box received the food pellet. Each of the experimental Ss was matched with a control S that received the same number and temporal order of reinforcements, following a response. . . . Ss in the competitive situation showed an increase in response rate considerably greater than the matched control Ss. Within broad limits, the amount of competitive facilitation was negatively related to the relative skill of the S. . . . As the length of the contest was increased [by requiring 1, 3, or 9 responses] the probability was increased that one S would receive all the reinforcements and that the other S would extinguish. The results of the experiments were considered to be similar to those of previous work on variable interval schedules of reinforcement with 'limited hold.'"—B. J. House.

7831. Fowler, Harry. (U. Pittsburgh) **Facilitation and inhibition of performance by punishment: The effects of shock intensity and distribution of trials.** *J. comp. physiol. Psychol.*, 1963, 56(3), 531-538.—To assess the possible dynamogenic effect of punishment on performance, 10 groups of 10 hungry rats each were run in an alley to food and 1 of 5 different strengths of shock at the goal (0-110 v.) on each of 80 massed or distributed training trials. By the end of training, distribution of speeds for each shock condition was bimodal: approximately $\frac{1}{2}$ of the Ss of each group were slowed down by shock and $\frac{1}{2}$ were speeded up, with these effects being generally greater the greater the shock intensity. The facilitation and inhibition of speeds were highly related to compatible and incompatible responses elicited by shock at the goal, a fact which fits well with S-R reinforcement theory.—*Journal abstract.*

7832. Hill, Winfred F., Cotton, John W., & Clayton, Keith N. (Northwestern U.) **Effect of rewarded and nonrewarded incorrect trials on T maze learning.** *J. comp. physiol. Psychol.*, 1963, 56(3), 489-496.—6 groups of 16 rats received either 0 or 8 rewarded trials and either 0, 8, or 16 nonrewarded trials on incorrect side of T maze; all received 16 rewarded trials on the correct side. Reward on the incorrect side affected differential speeds but not choices. Nonrewards on incorrect side increased frequency of correct choices, but amount made no difference. 100% reward on both sides produced no preference for the more frequently rewarded side. Experiment 2 replicated this finding and showed a significant preference for the less frequent side. In Experiment 3, no preference was found between the 2 sides, one experienced 16 times and the other 8, either with 50% reward on both sides or with 100% reward on the more frequent and 75% on the less frequent side. (16 ref.)—*Journal abstract.*

7833. Hill, Winfred F., & Spear, Norman E. (Northwestern U.) **Extinction in a runway as a**

function of acquisition level and reinforcement percentage. *J. exp. Psychol.*, 1963, 65(5), 495-500.—Level of acquisition training (8, 16, 32, 64, and 128 trials) and percentage of food reinforcement (100% and 50% random) were combined factorially for 100 rats in a straight alley. Acquisition was by massed training and was followed by 28 trials of massed extinction on one day and 12 on the next. Running speed in late acquisition was an increasing function of training level, with no significant effect of percentage. Running speed early in extinction was also an increasing function of training. This effect disappeared as extinction progressed for the 100% but not for the 50% groups. These results do not support the hypothesis, suggested by previous studies, that resistance to extinction is and inverted U function of degree of training. (16 ref.)—*Journal abstract.*

7834. Jensen, Glen D. (De Paul U.) **Preference for bar pressing over "freeloading" as a function of number of rewarded presses.** *J. exp. Psychol.*, 1963, 65(5), 451-454.—200 rats were given a choice between eating pellets from a dish attached to the floor of a Skinner box or pressing a bar to earn pellets after 40, 80, 160, 320, 640, or 1280 rewarded presses. All but 1 of the rats left the food dish and resumed pressing the bar at some point during a 40-min. choice period. The mean percentage of all pellets eaten during the choice period that were earned by bar pressing was shown to be an increasing function of the number of rewarded presses made prior to the choice period.—*Journal abstract.*

7835. Marx, Melvin H., & Brownstein, Aaron J. (U. Missouri) **Effects of incentive magnitude on running speeds without competing responses in acquisition and extinction.** *J. exp. Psychol.*, 1963, 65(2), 182-189.—32 albino rats were given 1 trial daily in a 14-ft. runway for a total of 73 acquisition and 72 extinction trials. Trials with competing responses (stopping and/or reversing and retracing) were scored separately. Except for the slow running of the 8% sucrose group, running speed with gross competing responses thus eliminated did not consistently vary with percentage of sucrose reinforcement. However, it increased regularly during acquisition and decreased regularly during extinction. The data also indicate the role of competing responses to be markedly greater, in slowing performance, during extinction. It is concluded that changes in running can be directly produced by affecting the vigor of responding, and are not merely effected indirectly, by changes in the amount of interfering behavior.—*Journal abstract.*

7836. Marx, Melvin H., & Knarr, Frederick A. (U. Missouri) **Long-term development of reinforcing properties of a stimulus as a function of temporal relationship to food reinforcement.** *J. comp. physiol. Psychol.*, 1963, 56(3), 546-550.—24 rats were born and lived from 3 to 4 weeks in darkness. Different lightfeeding relationships were then initiated and continued for 22 weeks followed by 20 light-contingent bar pressing sessions, 1 per week. Results revealed that the group with light preceding food reinforcement responded more frequently than the other groups. However, the bar press output of this group declined over experimental sessions while the group with light interpolated between feeding sessions showed an increment over weeks; neither the

group with light concurrent with food reinforcement nor the control (no light) group varied appreciably from their original operant level. (16 ref.)—*Journal abstract.*

7837. McCain, Garvin; Love, Nancey, & Gruer, William. (Arlington State Coll.) Extinction as a function of a small number of partially reinforced trials. *Psychol. Rep.*, 1962, 11(2), 451-454.—"After preliminary exploration [of a straight-alley maze] 23 naive rats were divided into two groups. One group received a reinforced, a nonreinforced, then another reinforced trial. The second group received three reinforced trials. During extinction the partial reinforcement group ran faster. This was discussed in relation to Spence's and Amsel's analyses of partial reinforcement."—*B. J. House.*

7838. McHose, James H. (State U. Iowa) Effect of continued nonreinforcement on the frustration effect. *J. exp. Psychol.*, 1963, 65(5), 444-450.—A total of 72 preshift and 144 postshift trials in the double alley runway was given to 48 female hooded rats randomly assigned to the following 3 groups: Groups 100-50, 100-0, and 0-0, designated according to preshift and postshift percentage reinforcement in the 1st goal box (G_1). Following the introduction of nonreinforcement, 2nd alley starting speeds for both Group 100-0 and Group 100-50 on G_1 nonreinforced trials were enhanced. The facilitative effects of nonreinforcement dissipated for Group 100-0, but persisted for Group 100-50. Group 10-50 1st alley starting speeds increased while Group 100-0 speeds decreased following the introduction of nonreinforcement. The results were interpreted as supportive of the frustration theory assumption that the parameters of frustration are dependent upon the strength of reward expectancy in the 1st alley.—*Journal abstract.*

7839. Pieper, W. A., & Marx, Melvin H. (U. Missouri) Effects of within-session incentive contrast on instrumental acquisition and performance. *J. exp. Psychol.*, 1963, 65(6), 568-571.—3 groups of 10 rats each were magazine trained and bar press trained daily over 28 days. 10 min. of 1-min. fixed interval magazine presentations were followed by 10 min. of 1-min. fixed interval bar pressing. The group whose incentive was shifted up from magazine to bar press (4-11.3% sucrose) showed an initial depression of acquisition bar press rate but an eventual asymptotic facilitation, compared with the 11.3/11.3% controls. The group whose incentive was shifted down (32/11.3%) showed an initial (but unreliable) facilitation and an asymptotic depression. Interpretation of these results is suggested in terms of the development of discrimination between magazine and bar press incentives.—*Journal abstract.*

7840. Poshel, B. P. H. (Parke, Davis & Co., Ann Arbor, Mich.) Is centrally-elicited positive reinforcement associated with onset or termination of stimulation? *J. comp. physiol. Psychol.*, 1963, 56(3), 604-607.—Permanent electrodes were implanted in rewarding areas of the forebrain or hypothalamus of rats. 2 distinct patterns of electrical stimulation were then tested for rewarding effects by means of a self-stimulation technique. Patterns of stimulating current were identical in energy and duration, but were direct opposites in shape. Stimulus A increased gradually in intensity and then terminated suddenly from

peak stimulation; the onset of Stimulus B was sudden, and it terminated gradually from peak stimulation. Stimulus B sustained rates of self-stimulation consistently higher than did Stimulus A. On this basis, B must be judged more effective in eliciting reward than A. This finding attests that electrically elicited reward is associated with the onset of central stimulation rather than with its termination.—*Journal abstract.*

7841. Wischner, George J., Fowler, Harry, & Kushnick, Stephen A. (U. Pittsburgh) Effect of strength of punishment for "correct" or "incorrect" responses on visual discrimination performance. *J. exp. Psychol.*, 1963, 65(2), 131-138.—The purpose was to investigate the effect of variation in shock intensity on the acquisition of a black-white discrimination by 56 white rats in a situation involving shock for the correct or incorrect response, a non-correction procedure, and 2 different training methods (free-vs. forced-choice). Differences in outcome between training methods were negligible. Shock intensity functions showed that errors increased with increasing intensities for shock-right groups, decreased with increasing intensities for shock-wrong groups. All shock-right groups were inferior to no-shock controls, a finding in opposition to the generalization that shock for the correct response facilitates performance.—*Journal abstract.*

Motivation & Learning

7842. Babb, Harold. (Hobart & William Smith Coll.) Transfer between habits based on shock and thirst. *J. comp. physiol. Psychol.*, 1963, 56(2), 318-323.—6 groups of 12 hooded rats, $\frac{1}{2}$ male and $\frac{1}{2}$ female, were run in a straightalley on thirst motivation, or on successive combinations of these conditions, and were then extinguished, $\frac{1}{2}$ on thirst drive and $\frac{1}{2}$ not on thirst drive. Extinction data tended to indicate incomplete summation in transferring from shock to thirst or from thirst to shock. Transfer data did not differentiate between groups trained on or transferred to shock but did differentiate between those trained on or transferred to thirst. Ss transferred from shock to thirst training evidenced a general inhibition of running speed which was maintained throughout transfer trials.—*Journal abstract.*

7843. Goodrich, Kenneth P., Zaretsky, Herbert. (U. Pennsylvania) Running speed as a function of concentration of sucrose incentive during pre-training. *Psychol. Rep.*, 1962, 11(2), 463-468.—"Ss in each of three groups of rats [$N = 91$] were pre-trained to drink one of three sucrose solutions, 3%, 11%, or 32%. Subsequently all Ss received 60 acquisition trials in a runway apparatus to an 11% sucrose incentive. Runway data showed no evidence for either the 'elation' or 'depression' contrast effects reported by Collier and Marx (1959) in a bar-pressing situation. The most conservative conclusion would be that the three different pretraining conditions produced no differential effect on subsequent runway performance. There was suggestive evidence that the 32% condition produces faster running than either 3% or 11%."—*B. J. House.*

7844. Goodrich, Kenneth P. (U. Pennsylvania) Supplementary report: Running speed as a function of sucrose concentration in a prior free-drink-

ing period. *Psychol. Rep.*, 1962, 11(2), 528-530.—"Rats in two groups of 14 Ss each were given 7 days of drinking experience prior to runway training. On each day 20 cc. of either 32% or 11% sucrose solution were ingested in S's home cage. On the next day all Ss were rewarded with 11% solution in a runway. The results showed no contrast effect."—B. J. House.

7845. Martin, James G., Loewe, Eveline M., Hinkle, Allan E., & Fitzgerald, Marilyn L. (Chico State Coll.) Net approach gradient in approach-avoidance conflict. *J. exp. Psychol.*, 1963, 65(5), 520-521.—This experiment tested the implication from conflict theory that net approach tendencies decrease nearer the goal in approach-avoidance. 16 albino rats, trained previously to run to food in an alley while 45 hr. food deprived, were shocked near the goal box. 2 days later Ss were tested for approach tendencies at points far (F) and near (N) the goal by measuring strength of pull. Each S pulled for 4 trials, half in FNNF order, half in NFFN order. Mean pull in grams at the near point was significantly less than at the far point ($p < .01$), as predicted.—*Journal abstract*.

7846. Pavlik, William B., & Reynolds, William F. (Rutgers U.) Effects of deprivation schedule and reward magnitude on acquisition and extinction performance. *J. comp. physiol. Psychol.*, 1963, 56(2), 452-455.—80 female rats were given 80 training trials in a runway under 2 conditions of food deprivation combined factorially with 2 levels of reward magnitude, followed by 50 extinction trials during which half of the Ss in each group were tested under each deprivation condition. Analyses of running speeds at training asymptote and during various portions of extinction yield consistent results to the effect that both deprivation period and reward magnitude have significant effects upon running speed and that these effects are statistically independent. The results are interpreted as supporting Spence's suggestion that drive and incentive magnitude combine additively in determining reaction potential.—*Journal abstract*.

7847. Yarczower, Matthew; Freygold, Kap, & Blum, Norman. (U. Maryland) Effects of amount, percentage of reinforcement and deprivation condition on runway time. *Psychol. Rep.*, 1962, 11(2), 406.—In a $3 \times 2 \times 2$ factorial design with 60 rats, all 3 factors had significant effects on asymptotic running times. Interactions among the factors predicted by Amsel's frustration mechanism were not found.—B. J. House.

Complex Processes

7848. Behar, Isaac. (USA Medical Research Lab., Fort Knox, Ky.) Evaluation of cues in learning set formation in mangabeys. *Psychol. Rep.*, 1962, 11(2), 479-485.—"Six naive sooty mangabeys were given 300 object-discrimination problems. Six problems were presented daily of which two each lasted 4, 7, and 10 trials. Following the discrimination trials on each problem, a 'critical trial' was given in which either the positive or the negative stimulus was paired with a neutral stimulus. . . . Responses on the critical trials indicated the development of both approach and avoidance tendencies, although the former largely

exceeded the latter. This difference was interpreted in terms of the disparate frequency of response to the positive and negative stimuli during the discrimination trials." Results were similar to those from experiments with macaques.—B. J. House.

7849. Bowman, Robert E. (U. Wisconsin) Discrimination learning-set performance under intermittent and secondary reinforcement. *J. comp. physiol. Psychol.*, 1963, 56(2), 429-434.—The performance of experienced rhesus monkeys was measured in terms of latencies and percentage of correct responses at reward percentages of 100:0, 75:0, 50:0, and 25:0 on discrimination learning-set problems, both in the presence and absence of secondary reinforcing stimuli. Latencies increased significantly at the 2 lower reward percentages. Between-problem learning occurred except under conditions of 50:0 and 25:0 in the absence of secondary reinforcement, and percentage of correct responses with respect to the maximum possible declined with decline in reward percentage below 75:0. Within-problem learning occurred under all conditions. Some interpretation of the data with regard to response strategies was made.—*Journal abstract*.

7850. Brown, W. Lynn, & McDowell, A. A. (U. Texas) Response shift learning set in rhesus monkeys. *J. comp. physiol. Psychol.*, 1963, 56(2), 335-336.—15 adult male rhesus monkeys, survivors of a previous comprehensive study of whole-body irradiation effects, were tested on 24 object-quality discrimination problems each day for 40 days. 2 trials were given on each problem. Response to either object was rewarded on the initial trial of each problem. Response to the object not responded to on the initial trial was rewarded on the 2nd trial. While none of the effects involving radiation variables approached significance, improvement with practice was beyond the .001 significance level. These results demonstrate that rhesus monkeys can acquire a "response shift learning set."—*Journal abstract*.

7851. Butler, Robert A., & Woolpy, Jerome H. (U. Chicago) Visual attention in the rhesus monkey. *J. comp. physiol. Psychol.*, 1963, 56(2), 324-328.—Monkeys' viewing behavior to various 2-dimensional displays provided by slides and motion pictures was studied by a paired-comparison testing technique. The number of times and the total duration of time that S viewed each display in a 2-window cubicle were recorded automatically. Monkeys spent more time ($p < .01$) viewing motion pictures that were: (a) in focus, (b) brightly illuminated, (c) moving at normal rather than slower rates, (d) in color, and (e) spatially oriented in the proper manner. They watched automatically changing slides more than stationary slides ($p < .01$). The duration of individual viewing responses contributed more to total viewing time than did the number of viewing responses.—*Journal abstract*.

7852. Gleitman, Henry; Wilson, W. A., Jr., Herman, Magdalena M., & Rescorla, Robert A. (Swarthmore Coll.) Massing and within-delay position as factors in delayed-response performance. *J. comp. physiol. Psychol.*, 1963, 56(2), 445-451.—9 rhesus monkeys were tested on delayed response under 2 conditions of spacing of trials. Massing of trials led to poorer performance than that

obtained with widely spaced trials. Performance deteriorated more after a series of long-delay trials than after a series made up of an equal number of short-delay trials, leading to the conclusion that the deleterious effect of massing is at least partially a result of frustration or extinction. Spatial position in the testing cage acted as an error factor in determining response and was not generally used to "bridge the delay gap." (15 ref.)—*Journal abstract*.

7853. Lilly, John C. (Communication Research Inst., Miami, Fla.) **Distress call of the bottlenose dolphin: Stimuli and evoked behavioral responses.** *Science*, 1963, 139(Whole No. 3550), 116-118.—Analysis of the many different vocal productions of pairs of bottlenose dolphins (*Tursiops truncatus* Montagu) and the related behavior patterns shows that 1 pair of specific short (0.2-/0.6 sec.) whistles was consistently stimulated by physical distress. This call stimulated nearby animals to push the head of the distressed animal to the surface to breathe. After the animal breathed, a vocal exchange preceded other forms of aid.—*Journal abstract*.

7854. Poulter, Thomas C. (Stanford Research Inst., Menlo Park, Calif.) **Sonar signals of the sea lion.** *Science*, 1963, 139(Whole No. 3556), 753-755.—Tape recordings were made of the underwater noises of captive sea lions swimming in a concrete pool at night. When approaching pieces of fish that were thrown into the water, the sea lions emitted trains of sound signals like those of the bat and the porpoise. A detailed analysis of these noises shows that they meet the criteria of a pulse-modulated sonar system and, in fact, reveal an amazing sophistication so far as echo ranging is concerned.—*Journal abstract*.

7855. Rumbaugh, Duane M., & McQueeney, John A. (San Diego State Coll.) **Learning-set formation and discrimination reversal: Learning problems to criterion in the squirrel monkey.** *J. comp. physiol. Psychol.*, 1963, 56(2), 435-439.—The development of learning set (LS) by criterional training procedures and the development of discrimination reversal (DR) by traditional methods were studied in 4 squirrel monkeys. Each LS problem was learned to an intraproblem criterion of 20 correct responses in 25 trials. Training continued to an interproblem criterion. In subsequent DR training each S was trained to the criterion of 10 errorless and consecutive responses on reversal Trial 2. On the last 5 LS problems Trial 2 performance was 80% correct and Trial 2-6 performance was 89% correct. It is suggested that with the smooth-brained primate, such as the squirrel monkey, and subprimate mammals, LS might accrue more efficiently by criterional training methods than by administering a small and fixed number of trials per problem.—*Journal abstract*.

7856. Wenner, Adrian M. (U. Michigan) **Sound production during the waggle dance of the honey bee.** *Anim. Behav.*, 1962, 10(1-2), 79-95.—When bees that were marked while feeding after flights of up to 1230 meters, dance sounds were recorded and subsequently analyzed spectrographically. The pulsed sound of approximately 200 cps produced during the straight run of the dance is described and shown not to be an incidental result of vibration of the abdomen. The straight-run time and the number of sound pulses emitted correlated more with distance to food than

other components of the dance. The effect of wind showed that bees signal flight time to food, not return time.—*W. J. Copps*.

SOCIAL BEHAVIOR

7857. Bartholomew, George A., & Collias, Nicholas E. (U. California, Los Angeles) **The role of vocalization in the social behaviour of the northern elephant seal.** *Anim. Behav.*, 1962, 10(1-2), 7-10.—Observations and tape recordings were gathered on a herd of some 116 seals during the breeding season on a California island rookery. 2 groups of sounds with distinct structural characteristics appeared in adults. "Attraction sounds (mother to pup) are unpulsed, of high and variable pitch, and show clear harmonic structure. Threat sounds (both male and female) have an opposite type of structure; they are highly pulsed, of low and steady pitch, are harsh and lack clearcut harmonics." These findings are discussed in connection with ontogeny and evolution of vocalization in this seal.—*W. J. Copps*.

7858. Michael, Richard P., & Herbert, J. (Maudsley Hosp., London, England) **Menstrual cycle influences grooming behavior and sexual activity in the rhesus monkey.** *Science*, 1963, 140(Whole No. 3566), 500-501.—The time spent by the female rhesus monkey in grooming the male fluctuates rhythmically and reaches a minimum at mid-cycle. At this time the male's grooming activity reaches a maximum. The rhythmic changes in male mounting behavior, together with the males' and females' grooming cycles, are abolished by ovariectomy and have a hormonal basis.—*Journal abstract*.

7859. Wilson, James R., Kuehn, Robert E., & Beach, Frank A. (U. California) **Modification in the sexual behavior of male rats produced by changing the stimulus female.** *J. comp. physiol. Psychol.*, 1963, 56(3), 636-644.—25 male rats copulated with 25 estrous females until they reached an arbitrary criterion of sexual exhaustion. At this point replacement of the original female by a new estrous partner sometimes resulted in the resumption of mating activity and the achievement of 1 or more additional ejaculations. Removing and returning the original female had only a slight stimulating effect. Substitution of a female that had recently mated with another male was more likely to evoke renewal of sexual activity. The most effective procedure involved replacement of the original partner by an unmated estrous female. (20 ref.)—*Journal abstract*.

7860. Bernstein, Irwin S. (Yerkes Lab., Orange Park, Fla.) **Response to nesting materials of wild-born and captive-born chimpanzees.** *Anim. Behav.*, 1962, 10(1-2), 1-6.—Raters judged quality of nests constructed daily from supplied materials by individually caged adults. All 7 wild-born but only 8 of 17 captive-born animals built nests. 18 of the 21 built by wild-born animals were rated good; only 5 of the 54 built by captive-born were rated good. The 2 types of Ss showed equal freedom and ability to transport and manipulate the materials required in nest construction. Neither sex nor age differences appeared. The authors conclude that "nesting is not independent of experience in the chimpanzee."—*W. J. Copps*.

ABNORMAL BEHAVIOR

DEVELOPMENTAL PSYCHOLOGY

INFANCY

7861. **Franus, Edward.** *Jeszcze o reakcjach strachu niemowląt na widok i głos osoby nieznannej i zamaskowanej.* [More on infants' fear reactions at the sight and sound of an unknown and masked person.] *Psychol. wych.*, 1962, 5(4), 392-401.—Charlotte Buehler's experiments on fear in children were replicated with contradictory findings. A classification scheme of negative responses, which was more comprehensive than the original and based on Pavlovian theory, was responsible for the different results. Fear reaction to a masked person reached its peak between 6-7 mo., and reaction to an unknown person between 12-15 mo.—*H. Kaczkowski.*

7862. **Provence, Sally, & Lipton, Rose C.** (Yale U.) *Infants in institutions.* New York: International Univ. Press, 1962, xv, 191 p. \$5.00.—The learning experiences and developmental progress of 75 institutionalized infants in the 1st year of life were compared repeatedly with 75 babies reared in families. Procedures adopted included the Gessel Developmental Examination and the Hetzer-Wolf Baby Test, physical and neurological examinations and measurements, behavioral observations, the taking of case histories, and interviews with those responsible for the infant's care. Certain behavior patterns were found to be deviant in all institutionalized babies, other patterns of development were common to the 2 groups. It is concluded that severe deprivation of maternal care has an adverse effect upon the development of infants. Implications for both institutional and foster home mothering are offered.—*C. M. Franks.*

CHILDHOOD

7863. **Dennis, Wayne.** (Ed.) (Brooklyn Coll.) *Readings in child psychology.* (2nd ed.) Englewood Cliffs, N. J.: Prentice-Hall, 1963, xi, 532 p.—\$8.00 (paper).—A revision of the 1951 book containing parts which were not in the earlier edition. $\frac{1}{2}$ of the selections were published after 1951. The 54 selections are divided into 10 sections as follows: "Prenatal and Neonatal Behavior," "Perceptual-Motor Development," "Emotional Development," "Language Development," "Intellectual Development," "Personality Development," "Duration of the Effects of Early Experiences," "Biological Influences Upon Development," "Cultural Influences Upon Behavior," and "The Development of Stability in Behavior." Each selection is prefaced by a short explanatory paragraph by the editor.—*G. Deskin.*

7864. **Jakubowski, M.** *Zagadnienie samowychowawczej aktywności dziecka w ujęciu Janusza Korczaka.* [Janusz Korczak's ideas on the self-educating activity of the child.] *Psychol. wych.*, 1962, 5(4), 375-391.—The article reviews the life work of Janusz Korczak, a Polish pediatrician, who developed various methods and procedures to assist the self-development in orphans. His key premise was that self-rule in the orphanage enhanced self-development.—*H. Kaczkowski.*

7865. **Sethi, Janak.** *Children's fantasies.* *Res. Stud.*, U. Allahabad, 1962, 13, 18-24.—Fantasies of 40 boys, ages 5+ and 10+, were studied with the help of the Children's Apperception Test and free draw-

ings. The stories and the drawings were analyzed for content, level of fantasy, and organization of thought. The results show that children's fantasies at 5+ mainly revolve around the family; those at 10+ are in the area of the home. Fantasies at 5+ are marked by fear and peer group references; children of 10+ showed interest in outdoor life, novel situations, and reality orientation. Children at 10+ are more confident about themselves.—*U. Pareek.*

Learning

7866. **Anderson, C. C.** (U. Alberta) *The relationship between inhibition of motor response and cognitive performance.* *Brit. J. educ. Psychol.*, 1962, 32(3), 234-240.—A sample of Grade 8 pupils was given tests of motor inhibition, cognition, socioeconomic status, psychological control, and dogmatism. The hypothesis that capacity for motor inhibition is correlated with cognitive performance was supported, but not the hypothesis that this is related to child-rearing practices. (30 ref.)—*B. T. Jensen.*

7867. **Myers, Jerome L., & Myers, Nancy A.** (U. Massachusetts) *Secondary reinforcement in children as a function of conditioning associations, extinction percentages, and stimulus types.* *J. exp. Psychol.*, 1963, 65(5), 455-459.—96 preschool children were conditioned and extinguished in a free-operant situation. Extinction responses resulted in the presentation of either a light or a buzzer on either 20% or 100% of the trials. The extinction stimulus was 1 of 3 types: it was paired either with reward only during conditioning (PAS), or with reward and nonreward (MAS), or with nonreward (NAS) only. The PAS resulted in most extinction responses followed by the MAS and then the NAS. More responses resulted from 100% presentation of the PAS than under the other conditions. The light was more effective than the buzzer.—*Journal abstract.*

7868. **Reese, Hayne W.** (U. Buffalo) *Verbal mediation as a function of age level.* *Psychol. Bull.*, 1962, 59(6), 502-509.—A variety of experimental paradigms (reversal-nonreversal learning, transposition learning, etc.) indicate that young children evidence less mediational behavior than older children. Many variables have been shown to influence mediation, but it is not yet clear whether the emergence of mediational behavior is a voluntary or involuntary process, i.e., modifiable or unmodifiable.—*W. J. Meyer.*

7869. **Sugimura, T.** (Osaka Classification Office for Juvenile Delinquents, Japan) [Effect of degree of original learning and time interval between two tasks on response shift.] *Jap. J. Psychol.*, 1962, 33(3), 133-140.—Boys were trained on a simple 2-choice size of color discrimination, and $\frac{1}{2}$ were then shifted to the discrimination task alternate to the one on which trained. The remaining $\frac{1}{2}$ were shifted following a 30-min. rest. Findings suggest that response shift was easier in the 30-min. rest group but was somewhat dependent upon the criterion of original learning. This finding is discussed in terms of differential effects on associative connections of the rest period.—*A. Barclay.*

7870. **Zinchenko, V. P., & Ruzskaia, A. G.** (RSFSR Acad. Pedagogical Sciences) *Sravnitel'nyi analiz osiazaniia i zreniia: Soobshchenie XI.*

Uchit li ruka glaz? [Comparative analysis of touch and vision: Communication XI. Does hand teach eyes?] *Dokl. Akad. Pedagog. Nauk RSFSR*, 1962, No. 3, 87-90.—It was always believed that in perceiving forms of objects touch was more effective than vision. In a series of experiments with preschool children the opposite conclusion was reached. It is not the hand which teaches the eyes to observe but the eyes teach the hand how to touch.—*A. Cuk.*

Abilities

7871. Klauer, Karl-Josef. (Heilpädagogisches Inst., Köln, Germany) **Sehschwäche und Intelligenz.** [Defective vision and intelligence.] *Z. exp. angew. Psychol.*, 1962, 9(4), 570-593.—The IQ mean of 67 pupils of a school for visually handicapped children was with 101.8 not significantly different from a normal population. However, children with severe visual handicaps showed a considerably higher verbal IQ and a lower performance IQ. The results are discussed with respect to their theoretical, diagnostic and pedagogic implications.—*W. J. Koppitz.*

7872. Piaget, Jean. **The origins of intelligence in children.** New York: Norton, 1963. 419 p. \$1.95 (paper).—A paper edition of a book originally published in 1952.

7873. Rivoire, J. L. (Tucson, Ariz.) **Development of reference systems in children.** *Percept. mot. Skills*, 1962, 15(2), 554.—144 well-adjusted, middle-class children of average ability were given a Form Development Test devised by the author which consists of 7 items in each of 4 types of space—topological, affine, projective, and Euclidean. Results show that children in this experiment developed topological concepts somewhat later than the Piaget and Inhelder sample. Projective concepts developed somewhat earlier, while affine relationships were well established by 6 years. Reference system development occurred for the most part later in this sample than in the sample reported by Piaget and Inhelder.—*W. H. Guertin.*

7874. Sokhina, V. P. (Moscow U., USSR) **O vydelenii figury iz fona doshkol'nikami: Soobshchenie III. Vydelenie formy v protsesse konstruirovaniia.** [Figure and ground discrimination by preschool children: Communication III. Differentiation of form in the constructing process.] *Dokl. Akad. Pedagog. Nauk RSFSR*, 1962, No. 3, 91-95.—The purpose of a series of experiments was to study the ability of Ss to analyze familiar figures into elements and to rebuild them with different kinds of material and using different methods. In this study Ss were given cardboard inserts to use as building materials under 2 conditions, by pointing out where each piece should go, and by actually putting the pieces together. The 1st solution was more difficult than the 2nd for all Ss.—*A. Cuk.*

7875. Thompson, Jack M., & Finley, Carmen J. (Sonoma County Schools, Calif.) **The relationship between the Goodenough Draw-a-Man Test and the Stanford-Binet Form L-M in children referred for school guidance services.** *Calif. J. educ. Res.*, 1963, 14(1), 19-22.—164 referred children (81 boys, 83 girls; kindergarten through grade 3; CA 5-9) were administered the 2 tests (order not specified). The IQs correlated .67 and had comparable ranges.

S-B IQs averaged 4.15 points higher than the Goodenough D-A-M IQs. "The mean discrepancy in IQ points between the two tests was 14.54. . . . It was concluded that the Goodenough Draw-a-Man Test has serious limitations as a test of intelligence for this population."—*T. E. Newland.*

7876. Wallach, Michael A. (Duke U.) **Perceptual recognition of approximations to English in relation to spelling achievement.** *J. educ. Psychol.*, 1963, 54(1), 57-62.—In an experiment with 55 5th-grade children, ease of perceptual recognition was determined for nonsense words which resemble English and for nonsense words which do not. With all children being equated in recognition accuracy for the latter words, good spellers were found to recognize the former words much more readily than poor spellers. These and further results permitted the conclusion that good spellers show much greater transfer of training than poor spellers—whether the basis for this transfer rests on the learning of the sequential probability structure of letters, on phonetic generalization, or on both.—*Journal abstract.*

7877. Wallon, Henri, & Sauterey, Rachel. **Pluralité et nombre chez les enfants de 4 ans ½ à 7 ans.** [Plurality and number in children 4½ to 7 years old.] *Enfance*, 1962, No. 3, 201-221.—3 groups of 50 children in successive grade levels were called upon to tell which of 2 piles of objects (Cuisenaire blocks) was larger or smaller, why this was so, how the piles could be equalized, and to draw the piles of objects. The kinds of verbal responses at each age reveal thresholds of development. Drawings show modes of abstraction and the development of schema necessary to abstraction.—*S. S. Marzolf.*

Personality

7878. Boulanger-Balleyguier, G. **Le C.A.T. et le Rorschach comme moyens de différenciation caractérielle entre les enfants.** [The CAT and the Rorschach as means for personality differentiation of children.] *Bull. Soc. Franc. Rorschach Meth. Proj.*, 1962, No. 13-14, 47-51.—3 groups of 6- and 7-year-old boys and girls—namely, well-adjusted, aggressive, and anxious (*n*'s = 15, 15, and 14, respectively)—established on the basis of teachers' responses to a questionnaire were given the Rorschach. Statistically significant differences were found, but the differences are suggestive rather than practically useful. The relation between the Rorschach and the CAT was studied using 155 other Ss, ages 3.0-8.3. Effects of mental age and chronological age obscured personality differences. H% did not correlate with the number of humans entering into the CAT responses. In general, the significance of responses on such tests varies with age and with the test.—*S. S. Marzolf.*

7879. Brachman, H. M., & Costello, C. G. (Regina General Hosp.) **Cultural and sex differences in extraversion and neuroticism reflected in responses to a children's personality inventory.** *Brit. J. educ. Psychol.*, 1962, 32(3), 254-257.—The Junior Maudsley Personality Inventory was administered to 261 male and 248 female Canadian high school students and 304 male and 230 female English students. Ages in both groups were between 14 and 16. In terms of mean scores the only differences was that females obtained higher neuroticism scores. Item analysis suggested that "acquiescence" is greater

among English children than among the Canadians.—*B. T. Jensen.*

7880. Brock, Timothy C. (Iowa State U.) Effects of prior dishonesty on postdecision dissonance. *J. abnorm. soc. Psychol.*, 1963, 66(4), 325-331.—145 children (aged 3-12) indicated liking for 3 toys and 3 crackers. After being exposed to a temptation to be dishonest and given a choice of 1 of the objects, they gave liking ratings of their chosen and unchosen alternatives. Postdecisions dissonance reduction (increased liking for the chosen, and decreased liking for the unchosen alternative) was greatest when choice from among dissimilar objects (toy and cracker) followed dishonesty; it was among dissimilar objects (toy and cracker) followed dishonesty; it was least when honesty preceded choosing from among similar objects (2 toys or 2 crackers). Results were consistent with formulations by Hull, on drive summation, and Lewin, on tension spread: irrelevant tension combines with relevant tension to produce greater response to the latter. (18 ref.)—*Journal abstract.*

7881. Brown, Daniel G. (USAF Hosp., Forbes AFB, Kan.) Sex-role preference in children: Methodological problems. *Psychol. Rep.*, 1962, 11(2), 477-478.—Inferences about sex-role preference from the It Scale for Children are complicated by the tendency of children of both sexes to perceive the "It" figure as masculine. "Explanation is discussed along with possible changes in the 'It' figure."—*B. J. House.*

7882. Dasgupta, S. K. (Meerut Coll., Merrut, India) An examination of the data on fear. *Agra U. J. Res.*, 1962, 10(2), 35-43.—A review of studies on fear, with special reference to subjective and environmental factors increasing susceptibility to fear, types of fears experienced at different age levels, relationship between fear and anxiety, degree of persistence of the fears of childhood into adolescence and adulthood, consequences of fear as a deterrent device, methods of prevention of fears, and techniques used to overcome fears. (37-item bibliogr.)—*U. Pareek.*

7883. Evoy, John J., & Christoph, Van F. (Gonzaga U.) Personality development in the religious life. New York: Sheed & Ward, 1963. viii, 247 p. \$3.95.—The book represents the edited transcript of an institute given by 2 priests, one a psychologist and the other a sociologist, to religious women in the summer of 1960. In dialogue form, it stresses the application of psychological studies to the life of nuns. The book comprises 14 chapters encompassing such areas as theories of infant behavior, socialization, anxiety, problems of adolescence, and overprotection, among others.—*H. Feifel.*

7884. Gordon, Jesse E., & Cohn, Faye. (U. Michign) Effect of fantasy arousal of affiliation drive on doll play aggression. *J. abnorm. soc. Psychol.*, 1963, 66(4), 301-307.—Amount of aggression shown by 2 groups of nursery school children was measured in doll interviews before and after a story was read to them. In one group the story was designed to arouse affiliation drive; the story told the other group was neutral. While the controls increased in aggression on the 2nd doll play session, the experimental group remained about the same. Initially high and low aggressive Ss were equally affected by the affiliation arousal, as were boys and girls. The results indicate that the arousal in fantasy of affiliation

drive significantly lowers the expression of aggression.—*Journal abstract.*

7885. Rudi, David. *Psikhologia hitpathutit: Yaldut umaavkey haneurim*. [Developmental psychology: Childhood and struggles of youth.] Tel Aviv, Israel: Izreel Publishing House, 1962. 208 p.—A textbook of lectures in psychology given to students of the Training College for Teachers of Biology and Agriculture. "I tried to treat the theories on development of personality recognized to-day." The recommended psychology is education oriented and psychoanalytically minded. The main topics are: influence or pregnancy and birth, the 1st year of life, the anal period, the phallic period, the latency period, and adolescence.—*H. Ormian.*

7886. Schwidder, Werner. (Ed.) Die Bedeutung der frühen Kindheit für die Persönlichkeitsentwicklung. [The importance of early childhood for the development of personality.] *Beih. Prax. Kinderpsychol. Kinderpsychiat.*, 1962, No. 5. 83 p.—The Association of German Psychagogues chose the theme of the influence of early childhood at its 1961 meeting. Schwidder discussed 12 examples of "harmful love-attitudes"; Tobias Brocher, the influence of early experience perceptions; Rudolph Adam, psychoanalytic insights as a basis for interviewing parents in child guidance clinics; M. Mausshardt, the life of the infant and young child in institutions; and Ursula Neumann, a case of compulsion reactions.—*E. Katz.*

7887. Selg, Herbert. (Ebertstr., 96, Oberhausen, Germany) Verlaufsformen und Erlebnisweisen bei einem Entstehungsexperiment. [Courses of events and modes of experience in a destruction experiment.] *Z. exp. angew. Psychol.*, 1962, 9(4), 523-569.—Children from 3 to 14 yr. were asked to use a rubber stamp to overstamp pictures. While the younger children were so fascinated with the activity that they paid no attention to the picture, older children were frequently reluctant to destroy the picture. By stamping patterns around favorite objects parts of the pictures were preserved. This tendency to restriction and to creative restructuring of a destructive process was lacking in a group of aggressive-destructive children tested for comparison.—*W. J. Koppitz.*

7888. Starkweather, Elizabeth K. (Oklahoma State U.) A comparison of two techniques for measuring sociometric status among nursery school children. *Proc. Okla. Acad. Sci.*, 1962, 42, 199-205.—3 different methods of scoring a 3-choice picture sociometric test were studied in order to determine which method provided the most accurate measure of social status for children in a nursery school group. A paired-comparisons picture sociometric test was used as the criterion of validity. The design of both tests was based on the assumption that an individual wants to benefit a person he likes. All 3 methods of scoring gave results which correlated significantly with the results of the paired-comparisons test; and a 2-1-1 weighting of raw scores gave the most accurate measure of social status for the children.—*Author abstract.*

Parent-Child Relations

7889. Couch, C. J. (Central Michigan U.) Family role specialization and self-attitudes in children. *Sociol. Quart.*, 1962, 3(2), 115-121.—60 college undergraduates reported on the degree to

which various family members performed certain everyday tasks, such as shopping, earning money, caring for children, etc., and they also responded to the question, "Who am I?" by writing 20 descriptive statements. The hypothesis that families with a high degree of role specialization would be more likely to produce children who defined themselves in terms of sex status was supported only for males. For females the trend was reversed: those girls who failed to identify themselves as females or daughters came from families with a high degree of role specialization.—*K. E. Davis.*

7890. Mahler, Margaret S., & Furer, Manuel. (Masters Children's Cent., NYC) **Certain aspects of the separation-individuation phase.** *Psychoanal. Quart.*, 1963, 32(1), 1-14.—Systematic study of mother-child inter-reactions of psychoanalytically trained workers was made for a group of normal infants ranging in age from 6 to 10 mo. to 3 yr. Certain conclusions are reached regarding separation-individuation in normal children and individual cases are discussed.—*J. Z. Elias.*

7891. Robbins, Lillian Cukier. (New York U.) **The accuracy of parental recall of aspects of child development and of child rearing practices.** *J. abnorm. soc. Psychol.*, 1963, 66(3), 261-270.—Retrospective accounts of child rearing obtained from parents of 3-year-olds were compared with reports they previously gave in the course of a longitudinal study begun with the birth of the child. The parents were quite inaccurate in their memory of details about child rearing practices and early development progress, in spite of the frequent rehearsal of these data due to their participation in the longitudinal study, and in spite of the relatively young age of the children. Inaccuracies were greatest for items dealing with the age of weaning and toilet training, the occurrence of thumbsucking, and demand feeding. Inaccuracies tended to be in the direction of the recommendations of experts in child rearing, especially on the part of the mothers. In general, mothers recalled more correctly than fathers. (20 ref.)—*Journal abstract.*

7892. Tolor, Alexander, & Rafferty, William. **The attitudes of mothers of hospitalized patients.** *J. nerv. ment. Dis.*, 1963, 136(1), 76-81.—50 mothers of a group of hospitalized psychiatric patients were compared with a control group of 50 mothers of high school students who had no apparent psychiatric disturbances. 4 scales on the Parental Attitude Research Instrument discriminated significantly between the 2 groups of mothers.—*N. H. Pronko.*

ADOLESCENCE

7893. Adler, Haim. **Tenuat hanoar bahevra hayisre'elit.** [The youth movement in Israel society.] Jerusalem, Israel: Ministry Education Culture & Szold Institute Child Youth Welfare, 1962. 84 p.—Intended for youth leaders, this is a sociological analysis of youth in Israel, especially of the youth movement (YM). The history of YM in Israel in the pre-state and state period and a forecast of its future are given. The author's analysis is followed by 3 "reactions" on behalf of 3 YMs.—*H. Ormian.*

7894. Lapiere, Jean-William, & Noizet, Georges. **Une recherche sur le civisme des jeunes à la fin de la quatrième république.** [Research on the civic

sense of youth at the end of the fourth republic.] Aix-en-Provence, France: Faculté Lettres & Sciences Humaines, 1961. (Ann. Fac. Lett. Aix-en-Provence No. 29) 174 p. NF 17.—This is a study of civic attitudes and citizenship practices of French youth toward the end of the 4th republic. Correlations between these attitudes and practices and numerous sets of psychometric and sociological data are offered. There was only a slight differential correlation between religious belief and the lack thereof and differences in civic sense. Either a firm religious or atheistic position was correlated with civic interest and responsibility, while indifference to such issues was correlated with a lesser degree of civic concern.—*R. F. Creegan.*

7895. McBride, Billie E. (U. Alberta, Canada) **The parental identification of adolescents.** *Alberta J. educ. Res.*, 1962, 8(4), 204-210.—Investigates "the sex-role and parental identifications of junior and senior high school students by comparing their self-perceptions with their perceptions of parent." Differences between Grade 7 and Grade 10 levels and between boys and girls are indicated.—*R. F. Allen.*

7896. Rottenberg, Matityahu, & Naor, Mordekhay. **Tenuot noar beyisrael uvaamim.** [Youth movements in Israel and abroad.] Tel Aviv, Israel: Amihay, 1962. 183 p.—"The development of this country during the last 20 years before establishing the State of Israel cannot be understood without the activity of Youth Movements [YM]." Nowadays they influence youth organizations even in developing countries in Asia and Africa. The psychological and sociological background of YM in general is analyzed, and modern YM as well as international youth organizations are described. The Jewish YM in Israel and all over the world is historically described, and its achievements and problems are critically analyzed.—*H. Ormian.*

7897. Rousselet, J. **Quelques aspects des ambitions sociales des adolescents.** [Some aspects of the social ambitions of adolescents.] *Enfance*, 1962, No. 3, 291-301.—A sample consisting of 100 boys and 100 girls seeking employment was interviewed to learn why they had quit school. Though recognizing the possibly superficial character of the responses, evidence is consistent with the hypothesis that desire for immediate financial gain, stimulated by overcrowded homes, is the major causal factor. The sample does not differ in intellectual level nor physical qualities from adolescents in general. "The absence in this population of dynamism, need for accomplishment, revolt, social aggressiveness, classically characteristic of adolescence, it appears, comes to be underlined in the same manner as its powerlessness to project itself even in dreams beyond the narrow limits in which it accepts confinement."—*S. E. Marsolf.*

7898. Zazzo, Bianka. **La représentation de la réussite chez les adolescents.** [Representation of success among adolescents.] *Enfance*, 1962, No. 3, 275-289.—Interviews with 600 adolescents were conducted to answer the question, "When you say, I would like my life to be a success, what exactly does that mean to you?" The factors considered important for achieving success were also investigated. Data were analyzed with respect to sex and socioeconomic status. Social success, i.e., material and professional or occupational, was dominant. Sentimental success

(to be loved, have friends, etc.) was more commonly mentioned for girls than for boys. Self-realization was also frequently noted. The factors leading to success were chiefly personal rather than external or adventitious. Socioeconomic and sex differences were frequent.—*S. S. Marzolf.*

MATURITY & OLD AGE

7899. **Butler, Robert N.** (National Inst. Mental Health, Bethesda, Md.) **The facade of chronological age: An interpretative summary.** *Amer. J. Psychiat.*, 1963, 119(8), 721-728.—A multidisciplinary pilot study of 47 male volunteers with a mean age of 71 and range of 65 to 91 suggests that "many manifestations heretofore associated with aging per se reflect instead medical illness, personality variables, and social-cultural effects."—*N. H. Pronko.*

7900. **Repond, A.** (Monthey, Switzerland) **L'hygiène mentale de la sénescence et de la vieillesse.** [Mental hygiene in senescence and old age.] *Vita hum.*, 1962, 5(3), 142-160.—The process of aging, both psychological and physical, is still not well-known in spite of the large number of studies devoted to the problem. It appears, however, that the problems accompanying aging are preventable or amenable to therapeutic procedures by the use of mental hygiene measures. Securing for the elderly person adequate economic income has been shown to help him maintain a respectable standard of living and a sense of independence. It is similarly feasible to give the individual feelings of personal dignity in later years by encouraging the development of interests and meaningful activities. Rehabilitative measures, reeducation, and occupational counseling have successfully been employed and could be expanded to help elderly people continue to manage themselves.—*J. L. Yager.*

7901. **Swenson, Wendell M.** (Mayo Clinic, Rochester, Minn.) **The many faces of aging.** *Geriatrics*, 1962, 17(10), 659-663.—Denigration of the aged, complexity of modern life, increasing longevity, and too little knowledge of gerontic abilities are considered with indications for how such problems should be approached.—*D. T. Herman.*

SOCIAL PSYCHOLOGY

7902. **Borgatta, E. F.** (U. Wisconsin) **Some comments on methodological developments in the last quarter-century.** *Sociol. Quart.*, 1962, 3(4), 296-315.—Recent methodological developments in social psychology and sociology were reviewed with an emphasis on 4 problems: mathematical models, survey procedures, experimental design, and measurement assumptions and the use of nonparametric statistics. The discussion of experimental design drew heavily on the work of Donald Campbell. The author criticized the shift from parametric to nonparametric statistics and the inappropriate use of variable levels of significance in the testing of hypotheses.—*K. E. Davis.*

7903. **Burnstein, Eugene; Moulton, R., & Liberty, P., Jr.** (Michigan State U.) **Prestige vs. excellence as determinants of role attractiveness.** *Amer. sociol. Rev.*, 1963, 28(2), 212-219.—116 undergraduate males responded to 4 TAT cards and a month later completed a questionnaire in which they

evaluated various occupations. The TAT protocols were scored for achievement motivation, while the occupations were rated for their prestige, the competence they required, and their attractiveness. Achievement values also were measured. "The excellence [i.e., competence] demanded by an occupational role and the prestige that it confers are positively related to its attractiveness. However, when relevant aspects of the motivational structure of role system members are examined, it is found that individuals high in achievement motivation and in achievement values prefer occupational roles which demand high excellence relative to the prestige they confer, while individuals low in achievement motivation and in achievement values prefer those which confer high prestige relative to the excellence demanded."—*L. Berkowitz.*

7904. **Kleiner, Robert J., & Parker, S.** (Temple U.) **Goal-striving social status, and mental disorder: A research review.** *Amer. sociol. Rev.*, 1963, 28(2), 189-203.—"The relationship of psychopathology and such social and psychological factors as social status, social mobility, and mobility orientation is examined. . . . There are conflicting data. The research on mobility orientation, however, shows that psychopathological groups usually have larger discrepancies between achievement and aspiration than 'normal' control groups. The findings on mobility orientation introduce the possibility of using social-psychological variables to account for (1) correlations between sociological variables and mental illness, and (2) apparently contradictory results."—*L. Berkowitz.*

7905. **Kosa, John.** **Two generations of Soviet man: A study in the psychology of Communism.** Chapel Hill, N. C.: North Carolina Univ. Press, 1962. viii, 214 p. \$5.00.—In order to assess the success of the Soviet in altering beliefs to "make" Communist men in 7 non-Russian European countries, the author, a native Hungarian who lived there until 1949, examines Communist writings and evaluates material gathered from Hungarian refugees. These latter data from 31 males of the well-educated classes of Hungary who left their native country after the revolution of 1956 include: (a) their fictional stories which seemed to characterize the Communist systems best, (b) answers to question about their life and career under Communism, and (c) checking of answers to (b) against "objective" information about the respondent. The change from Czarism to Communism is seen as requiring no personal adjustment to a monopolistic super-ego, only transfer of loyalty. "Making men" in countries without such prior political and value systems is more difficult but the Russians have evolved successful manipulative techniques and the indications are that unless the present trend is halted a 2nd generation of Soviet men may be produced.—*R. Schaeff.*

7906. **Russell, R. W.** (Indiana U.) **Roles for psychologists in the formulation and evaluation of policy.** *J. soc. Issues*, 1961, 17(3), 79-84.—A discussion of the contributions which psychologists can make toward analyzing national policies. In attempting to establish the underlying psychological and behavioral components of national policies a more sharply defined and effective program of action might ensue.—*A. Barclay.*

7907. **Stagner, Ross.** (Wayne State U.) **Personality dynamics and social conflict.** *J. soc. Is-*

sues, 1961, 17(3), 28-44.—Social conflict is viewed as a dynamic homeostatic process in which group identifications are strongly held and, as a consequence, perceptual distortions of the social environment are brought into play in order to maintain group integrity and values relatively constant. The importance of the perceptual process and its distortions in social conflicts, with resultant influence on group dynamics, is stressed.—*A. Barclay*.

CULTURE & CULTURAL RELATIONS

7908. Hoagland, Hudson, & Burhoe, Ralph W. (Eds.) *Evolution and man's progress. Daedalus*, 1961, 90(3), 411-610.—A group of 6 papers by biologists, social anthropologists, and psychologists, with comments from other participants. 2 of the papers—James F. Crow's "Mechanism and Trends in Human Evolution" and Julian H. Steward and Demetri B. Shimkrin's "Some Mechanisms of Sociocultural Evolution"—describe the current state of knowledge in the authors' respective fields. The other 4 papers raise questions concerning where we are going as a species and as a culture and where we should try to go. These papers are: Hermann J. Muller, "Should we Weaken or Strengthen our Genetic Heritage?"; Walter A. Rosenblith, "On Some Social Consequences of Scientific and Technological Change"; B. F. Skinner, "The Design of Cultures"; and Henry A. Murray, "Unprecedented Evolutions."—*K. E. Davis*.

7909. Kardiner, A., & Preble, E. *They studied man*. New York: New American Library (Mentor), 1963. 255 p. \$7.50 (paper).—A paperback edition of the book originally published in 1960.

7910. Powdermaker, Hortense. (Queens Coll.) *Copper Town: Changing Africa*. New York: Harper, 1962. xxiii, 391 p. \$7.95.—A report of a 1-year study in Northern Rhodesia where European mining interests are absorbing tribal peoples into a new pattern of industrial organization. With the help of a small, specially trained native team of assistants, the investigator recorded the talk of people in households, beer halls, public washing stands, and on the road. Native reactions to European and American mass media, and opinions on various matters are described and analyzed in relation to the mixture of European and tribal cultures.—*C. T. Morgan*.

7911. Rosenberg, Jerry M. (Brooklyn Coll.) *Ethnodrama as a research method in anthropology. Group Psychother.*, 1962, 15(3), 236-243.—Ethnodrama, the extension of psychodrama to the study of culture, presents a "valuable dimension for discovering the relations among the various groups in a community, the roles played by members of the groups, and the delineation of the groups in society." The author reviews some of the literature regarding the use of ethnodramatic methods in anthropology.—*I. W. Kidorf*.

7912. Stone, Doris. (San Jose, Costa Rica) *The Talamancan tribes of Costa Rica. Pap. Peabody Museum Archaeol. Ethnol., Harv. U.*, 1962, 43(2), 108 p.—Indians living in the east and west sloping highland valleys speak Bribrí or Cabécares. Otherwise both groups are similar. They plant tubers, fish, and hunt for food; and they manufacture barkcloth and vegetable fibre nets, hammocks, etc. Membership in a matrilineal clan determines residence, social rank,

and partners in marriage. Medicine men care ritually for the sick and the dead. Selections of folklore myth, songs, and linguistic texts are included.—*L. M. Hanks, Jr.*

7913. Wunderlich, Richard A., Youniss, James, & DeSoto, Clinton B. (Catholic U. America) *Schemas and kinship. Psychol. Rep.*, 1962, 11(2), 495-498.—"It is noted that the functional explanations usually given kinship systems . . . seem inadequate to account for the widespread practice of unilinear descent. It is proposed that the practice may be understood in part as a manifestation of the ordering and grouping schemas which have been found to dominate human thinking in various other situations. To provide evidence for this proposal, an experiment was performed, based on transformations of an old puzzle, in which American Ss were shown to have a tendency to think of descent as unilinear even though their society practices bilateral descent."—*B. J. House*.

SOCIAL STATUS & STRUCTURE

7914. Hernandez, David E. (Briarcliff High School, Atlanta, Ga.) *Is the concept of social class being misused in education? J. educ. Sociol.*, 1963, 36(7), 322-324.—Individual behavior cannot be predicted from socioeconomic status. The assumption that education is middle class oriented is matched against the author's unpublished dissertation in education which found that better communications exist between high school teachers and lower-class parents than between the teachers and any other group.—*H. K. Moore*.

7915. Litt, E. (Boston Coll.) *Civic education, community norms, and political indoctrination. Amer. sociol. Rev.*, 1963, 28(1), 69-75.—"A content analysis of civic education texts, interviews with community leaders, and questionnaires administered to civic education classes and control groups were conducted in three communities having different socioeconomic characteristics. In each community differences were found among political themes in civic education texts, attitudes of community leaders, and effects of courses on student political attitudes. In the upper middle-class community students were oriented toward a 'realistic' and active [view] of the political process, stressing political conflict; in the working-class community students were oriented toward a more 'idealistic' and passive view, stressing political harmony."—*L. Berkowitz*.

7916. Weiner, Max, & Murray, Walter. (Brooklyn Coll.) *Another look at the culturally deprived and their levels of aspiration. J. educ. Sociol.*, 1963, 36(7), 319-321.—Lower socioeconomic parents also want their children to go to college but, with them, it is only a wish; with the middle-class parent, it is an expectation.—*H. K. Moore*.

ATTITUDES & OPINIONS

7917. Adams, R. S. (U. Otago, Dunedin, New Zealand) *A further approach to attitude scaling. Brit. J. educ. Psychol.*, 1962, 32(3), 201-208.—245 student teachers rated classes in terms of numbers. The correlation between the scale and Likert scale scores was indicated by a coefficient of .76. Courses actually taken by students confirmed the ratings of

liking. Test-retest reliability coefficient for 190 students was .83 after about 8 mo.—*B. T. Jensen.*

7918. Aronson, Elliot; Carlsmith, J. Merrill, & Darley, John M. (U. Minnesota) The effects of expectancy on volunteering for an unpleasant experience. *J. abnorm. soc. Psychol.*, 1963, 66(3), 220-224.—In a laboratory experiment, Ss performed 2 tasks, one unpleasant, the other neutral. They were then led to expect that they would have to perform one of the tasks again. When subsequently presented with a choice, there was an increase in the probability of their choosing the expected task, even when it was objectively less pleasant. The results were interpreted in terms of an extension of the theory of cognitive dissonance.—*Journal abstract.*

7919. Bronfenbrenner, Urie. (Cornell U.) The mirror-image in Soviet-American relations. *J. soc. Issues*, 1961, 17(3), 45-56.—The author reports, as observations from personal experience, that Soviet-American views of one another's society are curiously similar. These views reflect similar attitudes but with the positive and negative values reversed depending upon the culture in which the observational vantage point exists. The findings are related to current psychological studies, notably the assimilation phenomena in which conflictual information is distorted in such a way as to be consonant with previously held attitudes.—*A. Barclay.*

7920. Chombart de Lauwe, P., Chombart de Lauwe, M. J., Kloskowska, Antonina; Piotrowski, J., Forget, Nelly; Nouacer, Khadidja; Rocher, Guy; Clignet, R., N'Sougan Agblemagnon, F. N., Rosenmayr, Leopold, & Burić, Olivera. Images of women in society. *Int. soc. Sci. J.*, 1962, 14(1), 1-176.—A series of 11 articles surveying changing attitudes toward women in France, Poland, Morocco, Canada, Ivory Coast, Togo, Austria, and Yugoslavia. In general, women are being more accepted into industrial employment (although a hierarchy of acceptance exists: single women must work, married women without children or with grown children may work, married women with small children must not work) and, as a consequence, are gaining more equality with men in society. However, certain apprehensions remain, rooted in the specific cultures surveyed and manifest in various concerns (such as promiscuity), which make complete acceptance of feminine equality difficult. Discussions of these factors for the various cultures are presented.—*A. Barclay.*

7921. Crane, Edgar. Immunization: With and without use of counter-arguments. *Journalism Quart.*, 1962, 39(4), 445-450.—An experimental study of the effects of a 2-sided message suggests that it may reduce the cognitive effects of subsequent counter-propaganda but be inferior to a 1-sided message in effects upon emotional responses.—*D. E. Meister.*

7922. Deutsch, Morton. (Murray Hill, N. J.) Some considerations relevant to national policy. *J. soc. Issues*, 1961, 17(3), 57-68.—Proceeding from the assumption that peace is now maintained by a "balance of terror," the author explores the possibility of maintaining peace by a "balance of mutual trust" and discusses some of the social psychological techniques that might be employed in bringing about such a state of affairs. Certain implications are drawn for

changes in national policies, both military and civilian.—*A. Barclay.*

7923. Foegen, J. H. (Winona State Coll., Minn.) Why attitude surveys fail to measure attitudes. *Personnel*, 1963, 40(2), 69-75.—Attitude surveys are described as more likely to yield answers that are either meaningless or misleading than to furnish management with insight into how employees feel about their jobs and their company. The author offers several reasons for the failure of attitude surveys to measure attitudes: (a) "Because of inherent defects in polls and questionnaires, (b) Because answers to questions can be either thoughtless, or conversely, carefully tailored to please the questioner. (c) Because unrealistic answers can easily be given unintentionally. (d) Because it is quite possible that employees do not know themselves what their attitudes are."—*V. S. Sexton.*

7924. Ford, A. B., Liske, R. E., & Ort, R. S. Reactions of physicians and medical students to chronic illness. *J. chron. Dis.*, 1962, 15, 785-794.—30 clinical faculty members and 27 senior medical students of Western Reserve University Medical School answered a sentence completion form, based on chronic illness and general medical subject matter. The initial hypothesis of negative reactions to chronic illness was not borne out by their responses. Overall reaction of faculty members and students was relatively neutral. Favorable feelings were expressed about situations involving diagnosis and treatment and respondents exhibited breadth and depth of thought in situations where they saw themselves professionally active. Interpersonal relationship of doctor and patient seemed to be of primary importance. Certain aspects of chronic illness did elicit negative feelings. Demanding, hostile, hopelessly ill, or disabled patients were viewed unfavorably. The sentence completion form proved to be a valuable tool for exploration of attitudes and thought processes. Responses could be analyzed easily according to both a reliable orientation index and a reliable index of comprehensiveness of thought in regard to chronic illness. Both indices are presented and the 30-item completion form is appended.—*V. Laties.*

7925. Frank, J. D. (Johns Hopkins U.) Emotional and motivational aspects of the disarmament problem. *J. soc. Issues*, 1961, 17(3), 20-27.—By analogy with the behavior of the individual psychiatric patient, the author explores possible parallels in the behavior of nations in resolving their disarmament conflicts.—*A. Barclay.*

7926. Katz, Daniel. (U. Michigan) Current and needed psychological research in international relations. *J. soc. Issues*, 1961, 17(3), 69-78.—6 areas of research are presented and discussed. The areas are (a) group conflicts and their resolution; (b) the basis for aggression and violence in the individual personality; (c) national imagery; (d) the role of public opinion; (e) the psychological basis of national sovereignty; and (f) social and psychological conditions conducive to developing international structures such as the United Nations.—*A. Barclay.*

7927. Kothurkar, V. K., & Pendse, V. V. A. study of social prejudice in three Indian villages: The problem of Nav-Buddhas. *J. U. Poona*, 1962, 15, 123-129.—The study reports preliminary results from 3 villages with populations of 1500, 1667, and

3500, respectively. In these villages people belonging to the lower castes have been converted to Buddhism. The villages with leadership of younger persons showed less prejudices than those with older leadership.—*U. Pareek.*

7928. Kuhn, M. H. (State U. Iowa) **Self-attitudes by age, and professional training.** *Sociol. Quart.*, 1960, 1(1), 39-55.—A test requiring the respondent to answer the question "Who am I?" by writing 20 different statements was administered to 1185 individuals ranging in age from 7 to 24. The older respondents were more likely to define themselves in terms of social group membership and categories such as age, sex, or educational attainment. Females identified themselves more often in terms of sex and kinship than did males and less often by race. As professional training increased, the likelihood of mentioning professional identification early in the list of statements increased. Different professional trainees were found to have marked differences in the extent to which their self-definitions contained ideological elements, statements of personal goals, and self-evaluations.—*K. E. Davis.*

7929. Meltzer, L. (Cornell U.) **Comparing relationships of individual and average variables to individual response.** *Amer. sociol. Rev.*, 1963, 28(1), 117-123.—A sample of 539 persons in 79 groups was drawn from a population of some 3000 committees throughout the United States which were voluntary or semivoluntary in nature and which dealt primarily with public-relations activities. Questionnaire responses were analyzed. "Tentatively, we have suggested that the relative magnitudes of the relation between individual response and individual or average variables will depend upon the instrumentality—to the individual or to his group—of the attachments which develop between individuals and their groups. . . . [It also is suggested] that at least for variables such as those included in this study . . . it appears that John Doe's behavior and attitudes are often more highly related to average responses of members in his group than to Doe's own answers to the same questions."—*L. Berkovits.*

7930. Meyers, William J., & Hohle, Raymond H. (Fels Research Inst.) **Questionnaire-anxiety and social conformity.** *Psychol. Rep.*, 1962, 11(2), 436.—A small but significant positive correlation was found between anxiety and conformity scores in a group of 40 undergraduates.—*B. J. House.*

7931. Milburn, T. W. (China Lake, Calif.) **The concept of deterrence: Some logical and psychological considerations.** *J. soc. Issues*, 1961, 17(3), 3-11.—A discussion of the implications of attaining an optimum level of deterrent power, a level which will achieve our political and military objectives without provoking aggressive reactions from others. The author points out that deterrence is not an end in itself but simply a means for lessening the probability of war, and that adequate deterrent power could lead to a reduction of military establishments in terms of their sheer size.—*A. Barclay.*

7932. Obenhaus, Victor, & Schroeder, W. Widick. (Chicago Theological Seminary) **Church affiliation and attitudes toward selected public questions in a typical midwest county.** *Rural Sociol.*, 1963, 28(1), 34-37.—1200 interviews with laymen in communities varying in size from farm

communities to county seat town, revealed an "almost complete failure to think theologically about social issues." The people believe that the minister may be no better informed than others, religious and social issues should be kept separate, and the present equilibrium should not be disturbed by introducing extraneous elements, i.e., social-ethical issues, in church.—*H. K. Moore.*

7933. Osgood, C. E. (U. Illinois) **An analysis of the cold war mentality.** *J. soc. Issues*, 1961, 17(3), 12-19.—A cogent analysis of the tendency to perceive our adversaries as all bad and to perceive ourselves as all good, pointing out that such perceptual distortions tends to make the possibility of attributing good motives to our adversaries highly unlikely. As a corollary, it then becomes difficult to envision alternative modes of structuring our relations and leads to a feeling of inevitability in regard to conflicts arising out of such mutual tensions. The possibility of unilateral graduated reductions of such tensions is explored from the point of view of producing reciprocal tension reductions in our adversaries.—*A. Barclay.*

7934. Paul, B. D., Green, A. L., Simmel, Arnold; Kirscht, J. P., Knutson, A. L., Raulet, H. M., Sanders, I. T., Gamson, W. A., Irons, P. H., & Kegeles, S. S. **Trigger for community conflict: The case of fluoridation.** *J. soc. Issues*, 1961, 17(4).—This was previously abstracted (see 37: 4872), but the issue number was given incorrectly.—*Editor.*

7935. Rickard, Thomas E., Triandis, H. C., & Patterson, C. H. (U. Illinois) **Indices of employer prejudice toward disabled applicants.** *J. appl. Psychol.*, 1963, 47(1), 52-55.—A scale to measure prejudice toward disabled applicants for employment, based upon the multifactor stimuli method of Triandis, was developed. The scale was used with 2 samples, a group of 18 personnel directors and a group of 87 school administrators, who rated applicants for the position of accountant and 3rd grade school teacher. 6 types of disability, as well as absence of disability were included in the scale. All disabled groups were subject to expressed prejudice. The disabilities could be ranked in terms of the amount of prejudice expressed toward them. Competence and sociability were also influential in ratings, the former being more significant and complementary with disability. The method can be used to measure prejudice of various groups toward disabilities in various settings.—*Journal abstract.*

7936. Siegman, Aron Wolfe. (U. Maryland School Medicine) **A cross-cultural investigation of the relationship between religiosity, ethnic prejudice and authoritarianism.** *Psychol. Rep.*, 1962, 11(2), 419-424.—43 Protestant students from a University in the southern United States and 41 Israeli students were given a number of personality and attitude scales. A correlation between religious belief and ethnic prejudice was found for the United States sample, but not for the Israeli sample. In the United States sample, religiosity was not correlated with authoritarian personality characteristics. In the Israeli sample, authoritarian personality syndrome was related to certain religious beliefs, but not to religious observance. Differences between the 2 groups are discussed in relation to religious and social differences.—*B. J. House.*

7937. Snider, James G. (U. Alberta, Canada) **Profiles of some stereotypes held by ninth-grade pupils.** *Alberta J. educ. Res.*, 1962, 8(3), 147-156.—"Purpose . . . is to provide information about the stereotypes of Canadian, French Canadian, Englishman, American Indian and Russian as they are perceived by ninth-grade Alberta pupils."—R. F. Allen.
7938. Waisanen, F. B. (Michigan State U.) **Self-attitudes and performance expectations.** *Sociol. Quart.*, 1962, 3(3), 208-219.—This study is a replication and extension of Chapman and Volkmann's 1939 study, "A Social Determinant of the Level of Aspiration" (see 13: 4234). The original finding—that the lower the prestige of the reference group whose fictitious norms were reported to the Ss, the higher the Ss' levels of expectation—was confirmed. In addition, the author found that a favorable general self-evaluation was positively related to performance expectations when the reference group was of an equal or higher prestige group, but not when it was a negative reference group; and that ethnocentric Ss tended to expect higher performance vis-a-vis the negative reference group than did nonethnocentric Ss. 239 Ss were employed in the study.—K. E. Davis.
7939. Wrench, David. (U. Oregon) **A note on "Student Acceptance or Rejection of War."** *Amer. sociol. Rev.*, 1963, 28(2), 277-278.—(See 37: 5618) 96 male and female Oregon college students filled out a questionnaire in which they rated their attitude toward international relations and how dangerous they thought the world situation was. Analyses of the data indicated: "First, the curvilinear relationship of strength of feeling to attitude scale position cannot be safely assumed in all cases but must be tested empirically. Second . . . those students who believe the international situation most dangerous are likely to be the most active in attempting to influence policy making." The students who perceived the world situation as most dangerous generally rated themselves as favoring a strongly aggressive stand in international relations.—L. Berkowitz.
7940. Wrightsman, Lawrence S., Jr. (George Peabody Coll. Teachers) **Dimensionalization of attitudes toward the Negro.** *Psychol. Rep.*, 1962, 11(2), 439-448.—100 southern white students were given a number of paper-and-pencil tests of attitudes toward Negroes. High correlations (.75-.80) were found between affective (liking for Negroes) and conative (degree of social contact desired) components of attitude, and moderately high correlations (.49-.58) between these 2 components and cognitive aspects (ratings of Negro and white occupational types).—B. J. House.
- GROUP INFLUENCES
7941. Banta, Thomas J., & Hetherington, Mavis. (U. Wisconsin) **Relations between needs of friends and fiancés.** *J. abnorm. soc. Psychol.*, 1963, 66(4), 401-404.—This study was undertaken to investigate complementarity and similarity of needs in mate and friendship selection. The Edwards Personal Preference Schedule (EPPS) was administered to 29 clusters of 6 Ss each. A cluster consisted of an engaged couple and a male and female friend of each fiancé. Evidence for similarity of needs in mate and friendship selection, but no consistent evidence for complementarity was found. Engaged couples were significantly alike on 8 of the 15 EPPS needs. In friendship pairings, females select female friends who are like themselves, males select male friends with few similar needs. The male fiancé selects the same type of woman as a friend and as a future spouse, but the female fiancée picks a male friend and a fiancé who are dissimilar. These findings indicate that different processes are involved in the formation of like-sex and opposite-sex pairs fulfilling different interpersonal roles.—Journal abstract.
7942. Broxton, June A. (Alabama Coll.) **A test of interpersonal attraction predictions derived from balance theory.** *J. abnorm. soc. Psychol.*, 1963, 66(4), 394-397.—The study explored the interpersonal attraction factors relating to roommate compatibility among college women. The sample consisted of 121 university women who requested roommate changes during the middle of the academic year. Using an adjective check list, each S described: (a) herself, (b) her originally assigned roommate, (c) her new roommate, (d & e) her perception of her roommates' description of her and (f) her perception of how most people viewed her. A comparison of the responses of the satisfied (new) roommates with those of the dissatisfied (original) roommates supported the following 2 hypotheses at the .01 level: (a) Interpersonal attraction varies with attitudinal similarity in regard to the self as an object of importance. (b) Interpersonal attraction varies more directly with perceived similarity than with objective similarity of self-other descriptions.—Journal abstract.
7943. Crowell, Laura, & Scheidel, Thomas M. (U. Washington) **A study of discussant satisfaction in group problem solving.** *Speech Monogr.*, 1963, 30(1), 56-58.—Satisfaction with both the process and product of interaction was investigated with reference to personal characteristics and personality value structures of discussants. 62 students served as Ss and completed the Allport, Vernon, and Lindzey Study of Values scale and rated their peers on 3 dimensions of small group behavior—individual prominence, group goal facilitation, and group sociability. The mean of peer ratings for these qualities for each S was correlated with the individual's estimate of satisfaction with process and product as were S's scores on the 6 dimensions of the Values scale. Except for one positive result, that between aesthetic value and satisfaction with process, all significant correlations were negative.—D. Lebo.
7944. Dunnette, Marvin D., Campbell, John, & Jaastad, Kay. (U. Minnesota) **The effect of group participation on brainstorming effectiveness for 2 industrial samples.** *J. appl. Psychol.*, 1963, 47(1), 30-37.—Problems were presented for brainstorming to 48 research scientists and 48 advertising personnel employed with the Minnesota Mining and Manufacturing Co. Within a counterbalanced experimental design, each S brainstormed certain problems individually and other equated problems as a member of a 4-man team. Individuals produced not only more ideas than groups, but they accomplished this without sacrificing quality. The net superiority of individual performance over group participation is highlighted by the fact that 23 of 24 groups produced a larger number of different ideas under the individual condition. The superiority of individual brainstorming over group brainstorming was relatively greater when

it was preceded by group participation. Apparently, group participation is accompanied by certain inhibitory influences even under conditions (e.g., brainstorming) which place a moratorium on all criticism.—*Journal abstract.*

7945. Gruen, Walter. (VA Hosp., Canadaigua, N. Y.) Tolerance for idiosyncratic roles in group cohesion. *Psychol. Rep.*, 1962, 11(2), 462.—A discussion of ways in which idiosyncratic as well as symbiotic role satisfaction in a group can promote group cohesion.—*B. J. House.*

7946. Harnack, R. Victor. A study of the effect of an organized minority upon a discussion group. *J. Commun.*, 1963, 13(1), 12-24.—"The objective of this study was to determine whether a minority could create a situation whereby the rest of the members of the discussion group could achieve closure [in Zeigarnik's sense] by accepting the position of a deviate." 20 groups of 6 Ss each were tested; in each group were 2 "plants," one of whom was to deviate from the group, the other who was to approximate the group norm. Ss were asked to react individually to a counseling case study and then to arrive at a group answer to the problem. "Plants" endeavored to swing the group to the deviate position. Significant changes in the hypothesized direction were observed.—*D. E. Meister.*

7947. Lombardi, Donald N. (Seton Hall U.) Peer group influence on attitude. *J. educ. Sociol.*, 1963, 36(7), 307-309.—Acts of a New Jersey student at the University of Mississippi in opposing the entrance of Meredith, the first Negro, to that school are given as an example of peer group influence on attitude.—*H. K. Moore.*

7948. Mouton, Jane Srygley, & Blake, Robert R. (U. Texas) Influence of partially vested interests on judgment. *J. abnorm. soc. Psychol.*, 1963, 66(3), 276-278.—In a study of the evaluation of group positions under various conditions of vested interests, 16 groups composed of 118 Ss spent approximately 12 hr. in autonomous ingroup activities prior to intergroup problem solving. An assigned problem served as the basis for creating different positions among groups. Competition was between pairs of groups. The judging pairs, who evaluated competing solutions, were composed with 2 degrees of vested interests: no vested interest or the condition of neutrality and partially vested interests with 1 person holding membership in a group whose solution was being judged and the other person from a neutral group. A vested interest in an inferior position led to judgments different from those obtained from nonvested pairs. In the latter situation, when the judging pairs included persons from the group with an inferior position, they were successful in elevating the evaluations of their position significantly above those given under baseline conditions of neutrality to a point where it, in effect, tied the better solution for adequacy.—*Journal abstract.*

7949. Newcomb, Theodore M. (U. Michigan) Stabilities underlying changes in interpersonal attraction. *J. abnorm. soc. Psychol.*, 1963, 66(4), 376-386.—Week-to-week changes in interpersonal attraction on the part of 2 17-man populations of initial strangers were observed over a 4-month period. These and 2 other kinds of responses (S's attitudes toward various objects, and estimates of one another's attitudes) showed individual changes during this pe-

riod. From first to last, however, there persisted a preference for psychologically balanced relationships among the 3 kinds of "elements." This psychological constancy helps to account for the nature of the observed changes. Since accuracy of estimates increased with acquaintance, balance increasingly characterized actual as well as judged relationships. Subgroup formation is interpreted in terms of psychological and objective balance, as constancies.—*Journal abstract.*

7950. Oakes, William F. (U. Hawaii) Reinforcement of Bales' categories in group discussion. *Psychol. Rep.*, 1962, 11(2), 427-435.—"During discussion of a psychiatric case in 4-person groups, Ss [N = 96 undergraduates] received reinforcements (flashes of a signal light indicating their statement exhibited 'psychological insight') for verbal responses falling into Bales' categories. Two groups were reinforced for responses falling into each of Bales' 12 categories. Conditioning, indicated by increased frequency of responses falling into the reinforced category, was found only for category 5, gives opinion. Possible explanations for this finding are suggested."—*B. J. House.*

7951. Oakes, William F. (U. Hawaii) Effectiveness of signal light reinforcers given various meanings on participation in group discussion. *Psychol. Rep.*, 1962, 11(2), 469-470.—Amount of verbalization of students in 24 4-person group discussions was measured as a function of reinforcing signal lights with varying instructions as to the meaning of the lights. Direction of reinforcement (positive vs. negative) had a significant effect, but denotative meanings (insight vs. agreement) and source of insight or agreement (professional, peer, or layman) attributed to the lights did not, although results were in the expected direction.—*B. J. House.*

7952. Turk, H. (Duke U.) Social cohesion through variant values: Evidence from medical role relations. *Amer. sociol. Rev.*, 1963, 28(1), 28-37.—Questionnaires were administered to the members of 30 2-person "teams" of student physician and student nurse working in the outpatient clinic of a university hospital prior to and after their clinic experience. The reported extent of interaction between pair members was selected as the index of the cohesion of the pair. The findings indicated that "the greatest team cohesion occurred where the two professional actors held different value orientations. This occurred because the bureaucratically oriented student physician granted a major role to the student nurse and the non-bureaucratically oriented student nurse assumed that role. Thus some variation in value orientations proved to be integrative for relations between different statuses."—*L. Berkowitz.*

7953. Verhofstad, O. Een onderzoek naar enige aspecten van het zelfconcept bij de leden van een kleine groep. [A study of some aspects of self-concept among members of a small group.] *Gawein*, 1962, 11(2), 145-164.—The significance of the self-concept forming elements was divided into thematical, athenatical, problematical, and ambiguous. 4 dimensions of behavior based on self-concept were classified into intelligence and creativity, attitude towards others, temper and attitude towards own manners. The role of significance and dimensions was studied in the self-concepts of members of a small group, using Stephenson's 0-method and 80 personal qualities in the Q-sort.

The results had to be interpreted according to the ideal standard the group had set up for its members. The thematical qualifications were reportedly found on the right side of the scale, the athematical on the left and the ambiguous in the middle, while the problematical were spread all over the scale.—*J. A. Lucker.*

LEADERSHIP

7954. Bowers, David G. (U. Michigan) **Self-esteem and the diffusion of leadership style.** *J. appl. Psychol.*, 1963, 47(2), 135-140.—Neither simple imitation, nor motivational coincidence, is adequate either to explain the frequent, superficial absence of similarities in leadership style across hierarchical levels (leadership climate) or to prescribe the best means for changing the style involved when climate does occur. Self-esteem of the lower-level supervisor is investigated as a mediating variable in this problem, in the context of an organization in which no formal human relations training had taken place. Variables were measured by questionnaires submitted to 17 foremen and their 330 male subordinates in a packaging materials plant. Hypotheses, all confirmed by the data, relate supportiveness of the foreman's supervisor to the foreman's behavior toward his subordinates through the attendant consequences of the foreman's self-esteem.—*Journal abstract.*

7955. Gold, Hilary A. (Brooklyn Coll.) **The importance of ideology in sociometric evaluation of leadership.** *Group Psychother.*, 1962, 15(3), 224-230.—919 children and their 30 teachers completed a series of sociometric questions intended to give an indication of their roles in the classroom, and a questionnaire designed to measure thinking patterns along a scale ranging from socially-integrative (SI) to dominative (SD) ideologies. Results showed (a) relationship between ideologies of children selected for leadership roles and the ideology of their teachers; (b) that the ideological perspective of the teacher was a significant factor in classroom orderliness or disruptiveness; and (c) leaders were found to possess more SI ideological frames of reference than their peers.—*I. W. Kidorf.*

7956. Inamdar, N. R., & Pendse, V. V. **Panchayat leadership: A case study.** *J. U. Poona*, 1962, 15, 188-193.—The case study shows that the "panchayat" (village council body) does not get co-operation from all sections. Leadership conflict are shown.—*U. Pareek.*

LANGUAGE & COMMUNICATION

7957. Cantor, Joel M. (School Medicine, Loma Linda U., Los Angeles, Calif.) **A parallel between Russian proverbs and history.** *Psychol. Rep.*, 1962, 11(2), 381-382.—Lists of Russian proverbs were found to contain a significantly larger proportion of references to predatory animal acts than lists of proverbs from other languages.—*B. J. House.*

7958. Harrah, David. (U. California, Riverside) **Communication: A logical model.** Cambridge, Mass.: Massachusetts Institution Technology Press, 1963. ix, 118 p. \$4.00.—"The over-all intent of this book is to show how symbolic logic and the theory of semantic information can be used to analyze certain aspects of human communication. The specific aim is to construct a model of how a rational receiver

evaluates a sequence of messages. . . . Our guiding assumption is that these questions can be satisfactorily answered only within . . . a theory of the sender-receiver situation. . . . In addition, the book presents a general discussion of the logic of questions, a discussion of meaning, description, and expression, and analyses of such concepts as interview, change of mind, controversy, and tradition." Among the topics covered are: the receiver's language, the receiver's logic, theory of questions, a logic of questions and answers, information, and meaning.—*D. E. Meister.*

7959. Manis, Melvin, & Blake, Joan B. (U. Michigan) **Interpretation of persuasive messages as a function of prior immunization.** *J. abnorm. soc. Psychol.*, 1963, 66(3), 225-230.—2 experiments were conducted in which passive immunization was achieved by providing Ss with counterarguments against persuasive messages to which they were later exposed. In both studies, this procedure produced a significant tendency to displace the perceived content of the "change" message toward the stand advocated in the immunization message. These results were tentatively attributed to the Ss' attempts to minimize the discrepancy between the opposing statements, both of which appeared to emanate from prestigious sources. Judgments were not affected by active immunization, a procedure in which Ss attempted to refute (in writing) weakened versions of the change message to which they were later exposed.—*Journal abstract.*

Speech & Linguistics

7960. Bernard, John L. (Alabama State Hosp.) **Manipulation of verbal behavior without reinforcement.** *Psychol. Rep.*, 1962, 11(2), 390.—Frequency of usage of the pronoun "I" for sentence completion decreased for sentences taken from the Pa scale of the MMPI as compared with neutral sentences for 13 female paranoid schizophrenics. 11 student nurses did not show such changes.—*B. J. House.*

7961. Copeland, Ross H. (U. Kansas) **The effects of feedback modification on verbal behavior. Part II.** *J. Speech & hear. Disord. monogr. Suppl.*, 1963, No. 10, 70-75.—Free-field delayed feedback was administered to 44 high and 44 low verbal level Ss in a solitary situation in order to determine the effect on verbal behavior. It was found the feedback condition elicited a significantly greater amount of verbalization from both groups.—*M. F. Palmer.*

7962. Durand, Marguerite. **Les différentes raisons pour lesquelles un mot appartient à une langue donnée.** [Why does a given word belong to a particular language?] *J. Psychol. norm. pathol.*, 1961, 4, 421-432.—The author describes 5 criteria according to which a given word is regarded as belonging to a particular language: 3 philological criteria and 2 criteria of usage. The words of a passage from Chateaubriand and one from Vercors are classified and compared.—*M. L. Simmel.*

7963. Kew, J. K., Rickard, H. C., & Timmons, E. O. (VA Hosp., Tuscaloosa, Ala.) **The stability of group verbal behavior.** *Psychol. Rec.*, 1962, 12, 323-325.—"The data presented in this paper were compiled from seven different groups of hospitalization veterans. Stability of verbal responding was demonstrated for each group over a period of time. Frequency of speaking, total time of speaking, number

of personal references and number of non-personal references were the measures of verbal behavior. The findings suggest that in a group situation there is a hierarchy of verbal behavior resembling the pecking-order established in other species."—*R. J. Seidel.*

7964. Miller, Arnold. (Clark U.) **Verbal satiation and the role of concurrent activity.** *J. abnorm. soc. Psychol.*, 1963, 66(3), 206-212.—2 studies, including 16 Ss in each, were performed to investigate the effect of concurrent activity on the maintenance of word meanings (verbal satiation). It was found, in both studies, that words repeated with activity maintained their meanings significantly longer than words repeated without activity. Word meaning maintenance was also found to relate to the kind of concurrent activity: words were more facilitated by actions customarily paired with them (e.g., push with pushing activity) than by actions not customarily paired with them. In addition, results indicated that a word could be maintained longer when the concurrent activity included (Experiment II) the added sensory input of vision. (18 ref.)—*Journal abstract.*

7965. Sukhanova, N. V. (Acad. Sciences, USSR) **Elektromiograficheskoe issledovanie "spontannoi" rechi u cheloveka.** [Electromyographic investigation of "spontaneous" speech in man.] *Dokl. Akad. Pedagog. Nauk RSFSR*, 1962, No. 3, 107-110.—EMGs were recorded of 20 Ss, children (age 1.5-7) and adults, under conditions of spontaneous speech (children were describing pictures, adults answering questions). The following muscles were used: gastrocnemius, biceps femoris, extensor digitorum communis, triceps brachii, and sternohyoid muscle. All the muscles were involved in speech of children from 1.5 to 5. Only the last 3 with children of 6-7 yr. In adults only the extensor and sternohyoid were active. —*A. Cuk.*

7966. Taylor, Insup Kim. (Johns Hopkins U.) **Phonetic symbolism re-examined.** *Psychol. Bull.*, 1963, 60(2), 200-209.—A number of previous observations and experiments in phonetic symbolism have been reviewed, and their methods of investigation and their rationale for existence or nonexistence of phonetic symbolism summarized. A series of 3 experiments by Taylor and Taylor were briefly presented. The present paper draws readers' attention to their experimental result that the same sound is associated with different meanings in different languages. The existence of phonetic symbolism on nonspatial dimensions is pointed out. A new rationale of phonetic symbolism has been suggested to account for these results, along with 2 ways to test this rationale. Finally, a few applications of these findings in phonetic symbolism have been proposed. (18 ref.) —*Journal abstract.*

7967. Yates, Aubrey J. (U. Western Australia) **Delayed auditory feedback.** *Psychol. Bull.*, 1963, 60(3), 213-251.—When S hears his own voice with a small time delay his speech may be seriously affected. The effects produced by delayed auditory feedback (DAF) include prolongation of vowels, repetition of consonants, increased intensity of utterance, and other articulatory changes. The significance of individual differences in susceptibility to DAF is considered in relation to personality and physiological characteristics. The technique may prove useful in the detection of auditory malingering

and has possible implications for the understanding of stammering. The discussion relates the findings to models of speech control. Methodological problems and future research needs are outlined. (74 ref.)—*Journal abstract.*

Mass Communication

ESTHETICS

7968. Berque, Jacques. **Sur l'esthétique musulmane et ses motivations psychologiques et sociales.** [The psychological and social roots of Islamic aesthetics.] *J. Psychol. norm. pathol.*, 1961, 4, 433-444.—A historical-sociological analysis of recurrent and new motifs in Arabian art.—*M. L. Simmel.*

7969. Israeli, Nathan. (Long Island U.) **Creative processes in painting.** *J. gen. Psychol.*, 1962, 67(2), 251-263.—In a self-observation study of painting, somewhat abstract outcomes—predominantly landscape fantasy—were varied. The sequence of operations began with exploration and search. Initial forms became tentative models and reference structures as the work continued. The composition, figure, and background, were transformed with long continued operations. A high-speed interaction between critical and creative factors was assumed to be based upon a continual observation of operations. Checks upon operations resulted in judgments and decisions that affected subsequent operations. Suddenness of a feeling of structural control, of imagery stimulation, and of a realization of structural transformation were noted. Dreams indicated no unusual intuitive discovery. A tendency to immediately rework and reconstruct spoiled or decomposed paintings indicated drive increment and secondary negative emotional reinforcement (Mowrer) as well as reversibility of operations (Piaget). Configurational aspects included good structure, structural requirements, reorganization, and restructuring.—*Author abstract.*

7970. Natadze, R. (Tbilisi, USSR) **On the psychological nature of stage impersonation.** *Brit. J. Psychol.*, 1962, 53(4), 421-429.—The hypothesis examined in the present paper is that it is fixated set evolved on the basis of picturing to oneself the particular imaginary situation imposed by the play that constitutes the foundation on which stage impersonation rests. Findings are presented of some experiments on the ability to evoke a set on the basis of an imagined situation. The Ss in these experiments were grouped as follows: (a) gifted actors and promising students of the Tbilisi Theatrical Institute; (b) persons unconnected with the theatre; and (c) persons incapable of stage impersonation. The data suggest a high correlation between the ability to evolve a set on the basis of imagination and the capacity for stage impersonation.—*Journal abstract.*

7971. Vossen, J. M. H. **Over expressiviteit.** [About expressiveness.] *Gawein*, 1962, 11(2), 81-144.—Several painters (de Chirico, Kandinsky, and Klee) think that man can fundamentally have a two-fold approach to things: the ordinary and the metaphysical one. A painting should be seen as a new metaphysical psychology of the object. An attempt is made to confront this opinion with modern psychological ideas, which are considered exclusively pragmatic. The validity of hypotheses, deduced from these painters' theories, is empirically tested. Psy-

chological analysis of the expressive aspects of human perception disclosed a dimension which was found to be closely linked with the "Ego-Te" relationship and seemingly to be realised on 3 distinct levels. In emotionally deprived children this dimension could not develop satisfactorily. Studies also tried to find a quantitative method to measure the development in this "Ego-Te" relationship. (29 ref.)—J. A. Lückner.

PERSONALITY & ABILITIES

7972. Cattell, Raymond B. (U. Illinois) **Personality, role, mood, and situation-perception: A unifying theory of modulators.** *Psychol. Rev.*, 1933, 70(1), 1-18.—Separation of personality and role is important both conceptually and for valid personality measurement. The concept of role stands at a crossroad where formulation of the group, perception, and the psychological situation intersect. The last is handled by distinguishing focal, ambient, and global stimulus situations, and representing them by situational indices obtained under different, controlled factor analytic experiments. Change of behavior in a role can be conceptualized as change of personality or of perception or both. Formally, mood change can be brought with role change under a general concept of modulators, expressible as a set of weight changes in the behavior specification equation. The modulator concept is considered in the context of evaluating traits across stimulus situations, responses, and temporal occasions, in the DR matrix. (22 ref.)—*Journal abstract.*

7973. Lyman, Howard B. (U. Cincinnati) **Test scores and what they mean.** Englewood Cliffs, N. J.: Prentice-Hall, 1963. xv, 223 p. \$5.00. (Text ed., \$3.75)—Scores obtained from a variety of tests—classified by the author as "maximum-performance, objective, supply-response, written, power or speeded and hand-or machine-scored"—are discussed in relation to basic statistics, norms, types of derived scores, and profiles. Cautions and suggestions are noted regarding interpreting and reporting the data to others. The book contains a selected bibliography, a glossary of terms, a conversion table of derived scores, and a summary of score characteristics. The style and contents are particularly suitable for familiarizing those of limited backgrounds in psychological and educational measurement.—I. Linnick.

NEW TESTS & TEST CONSTRUCTION

7974. Allison, Roger B., Jr. (U. Utah Coll. Medicine) **A two-dimensional semantic differential.** *J. consult. Psychol.*, 1963, 27(1), 18-23.—A "pathology score" summarized the distances of 28 stimulus words from a psychological origin for a modified semantic differential. Several groups of control Ss and psychiatric patients were used to assess various properties of the pathology scores. The scores had internal reliabilities of .77 for control Ss and .88 for psychiatric patients. Test-retest correlations were in the low .60s for control Ss and .45 for patients. Group differences showed a systematic increase in mean pathology scores as the severity of the mental illness increased. The factorial composition was related to clinical diagnosis and inversely to scores on perceptual closure tasks. Further refinement was recommended.—*Journal abstract.*

7975. Banta, Thomas J. (U. Wisconsin) **Critical note on unidimensional tests.** *Psychol. Rep.*, 1962, 11(2), 449-450.—"Methods of eliminating or reducing response biases typically introduce heterogeneity into test variance at the expense of unidimensionality. Given these incompatible goals, it is recommended that more attention be given to methods of test development which systematically increase test heterogeneity but which decrease biasing factors."—B. J. House.

7976. Heilbrun, Alfred B., Jr. (U. Iowa) **Revision of the MMPI K correction procedure for improved detection of maladjustment in a normal college population.** *J. consult. Psychol.*, 1963, 27(2), 161-165.—The problem investigated was whether a better system of K weighting could be developed for the 10 MMPI clinical scales to enhance their usefulness as measures of adjustment level within a grossly normal college population. 2-group discriminant analysis was used to determine the K value for each scale to maximize discrimination between maladjusted and adjusted college Ss, the sexes being considered separately. The revised weighting system differed greatly from the standard system; major differences were in negative weighting of Hy and deletion of weights from Hs, Pd, and Ma. Lesser changes in Pt and Sc weights were obtained, and D, Mf, Pa, and Si continued to be unweighted. Cross-validation of revised weights was shown for maladjusted college Ss and seriously maladjusted psychopathic hospital cases.—*Journal abstract.*

7977. Johnson, Rossall J. (Northwestern U.) **Two approaches to the prediction of group responses.** *J. appl. Psychol.*, 1963, 47(2), 158-160.—The method of measuring the ability of an individual to predict the responses of a group was examined. A comparison was made of a predictor's score when summing his correct prediction in one direction as compared to the number of responses in that direction. A relatively low correlation was obtained.—*Journal abstract.*

7978. Marcus, Arthur. (U. Massachusetts) **The effect of correct response location on the difficulty level of multiple-choice questions.** *J. appl. Psychol.*, 1963, 47(1), 48-51.—The influence of position response sets on a multiple-choice achievement test was investigated. Data on 434 students were obtained from 4 alternate test forms of 100 items each. The arrangement of correct choices and distractors was randomized throughout the test by a scheme which allowed each position an equal number of correct choices. The correct choice for each item appeared in a different position on each of the forms. Results indicate that objective multiple-choice tests are relatively free of position preferences. With this type of test it appears that position response sets are negligible and certainly not a significant source of invalidity. It is suggested that the position of the most plausible distractor more logically accounts for any significant response bias than does a position preference.—*Journal abstract.*

7979. Mullins, Cecil J. (Air Force Systems Command, Lackland AFB, Tex.) **Self-confidence as a response set.** *J. appl. Psychol.*, 1963, 47(2), 156-157.—2 tests, 1 spatial, the other verbal, were designed so that half the items on each test did not contain a correct alternative. Every item had "Correct answer not

given" as one of the alternatives. The responses to the alternative Correct answer not given correlate across the tests, even when the abilities measured by the 2 tests are partialled out. The Correct answer not given alternative is relatively independent of the aptitudes measured by the 2 tests.—*Journal abstract.*

7980. Norman, Warren T. (U. Michigan) **Relative importance of test item content.** *J. consult. Psychol.*, 1963, 27(2), 166-174.—The "Deviation Hypothesis" and some related notions presented by Berg including the contention that test item content is unimportant in personality measurement are critically examined. Some previous findings cited in support of these formulations are briefly reviewed. 2 additional sets of data comparing the effectiveness of test stimuli with different degrees of content relevance are presented. The results clearly indicate that for the criteria and subject populations considered, there exist marked differences in the validities obtainable from different classes of test stimuli—those with the highest degree of judged content relevance producing the most satisfactory results. The theoretical or explanatory value ascribed to the Deviation Hypothesis is called into question.—*Journal abstract.*

7981. Smith, Patricia Cain, & Kendall, L. M. (Cornell U.) **Retranslation of expectations: An approach to the construction of unambiguous anchors for rating scales.** *J. appl. Psychol.*, 1963, 47(2), 149-155.—A procedure was tested for the construction of evaluative rating scales anchored by examples of expected behavior. Expectations, based on having observed similar behavior, were used to permit rating in a variety of situations without sacrifice of specificity. Examples, submitted by head nurses as illustrations of nurses' behavior related to a given dimension were retained only if reallocated to that dimension by other head nurses, and then scaled as to desirability. Agreement for a number of examples was high, and scale reliabilities ranged above .97. Similar content validity should be obtained in other rating situations.—*Journal abstract.*

TEST STANDARDIZATION & EVALUATION

7982. Heilbrun, Alfred B., Jr. (U. Iowa) **Evidence regarding the equivalence of ipsative and normative personality scales.** *J. consult. Psychol.*, 1963, 27(2), 152-156.—The equivalence of ipsative and normative personality measures was studied both with regard to interscale correlation and relative validities. Need achievement and nurturance were measured by normative check lists, forced-choice ipsative Q sorts, composed of identical items and administered to the same 197 college Ss. The interscale correlations ranged from .43 to .72, the highest correlations being between the normative and Q sort measures. Only the forced-choice ipsative measure of need achievement related significantly to college GPA with ability partialled out, whereas the normative scale of nurturance showed the only reliable relationship with number of charitable activities. The results were interpreted as supporting the use of ipsative measures for normative predictions.—*Journal abstract.*

7983. Karp, S. A. (Ed.) (State U. New York Downstate Medical Center) **Kit of selected distraction tests.** Brooklyn, N. Y.: Cognitive Tests, 1962. 17 p.—5 experimental tests of ability to overcome the effects of distracting perceptual contexts are

included and discussed. Norms, reliability estimates, and factor-analytic validation data for 150 male college students are presented.—*Author abstract.*

7984. Lipetz, Milton E., & Milton, G. A. (U. Colorado) **Prediction of autonomy behavior from situational modifications of the EPPS n Autonomy Scale.** *Psychol. Rep.*, 1962, 11(2), 487-493.—"Items from the EPPS n Autonomy Scale were revised so as to make one set of items refer to autonomy from authority figures, and a parallel set refer to autonomy from peers. These two revised scales, plus the original EPPS scale were administered to 55 introductory psychology students who were subsequently placed in criterion situations where autonomy behavior could be assessed. None of the scales predicted autonomy behavior, thus failing to replicate Bernardin and Jessor's earlier study, and the inter-correlations among the original and revised scales were so high as to suggest little possibility of differential predictions are discussed.—B. J. House.

7985. Mukherjee, B. N. (U. North Carolina) **Second-order factor analysis of AAF perceptual tests.** *Percept. mot. Skills*, 1962, 15(2), 283-286.—In this 2nd-order factor analysis of 18 primaries, 7 interpretable 2nd-order factors were found. 2 were clearly perceptual; perceptual speed appeared more general than the 2nd one identified as closure. A space factor of more fundamental nature was also identified. The remaining 4 2nd-order factors were identified as verbal, deduction, immediate visual memory for movement detection, and directional visualization. The present study shows the possibility of interpreting the 2nd-order factors without considering the interpretations of the 1st-order factors.—W. H. Guertin.

7986. Ossola, Y. **Validering en interpretatie van een persoonlijkheidstest.** [Validation and interpretation of a personality test.] *Tijdschr. Stud. Beroepsorient.*, 1962, 9, 10-31, 49-60.—A study of the "Frustration Test for Youth" of Coetsier using factor analysis. 12 factors and 4 constellations were found.—R. Piret.

7987. Reger, Roger. (Wayne County Training School, Northville, Mich.) **Repeated measurements with the WISC.** *Psychol. Rep.*, 1962, 11(2), 418.—3 successive administrations of the WISC, at an average interval of 12 mo., given to 65 10-yr.-old, slightly retarded boys, showed significant increases in Performance and Full Scale, but not Verbal, quotients.—B. J. House.

7988. Rimm, David. (Stanford U.) **Cost efficiency and test prediction.** *J. consult. Psychol.*, 1963, 27(1), 89-91.—In evaluating the efficiency of a given screening instrument it is essential that the cost of a false positive error, relative to the cost of a false negative error, be taken into consideration whenever this information is available. An efficiency index based solely upon the expected proportion of correct classifications might well lead to an incorrect decision regarding the acceptance or rejection of a given test. A relatively simple formula is presented, taking into account error costs, as well as the discriminatory power of the instrument, and the population base rate. The formula is then applied to certain hypothetical examples, showing how a decision may be reversed when information regarding error costs is introduced.—*Journal abstract.*

7989. Santos, J. F., & Montgomery, J. R. (Menninger Found.) **Stability of performance on the Color-Word test.** *Percept. mot. Skills*, 1962, 15(2), 397-398.—In several studies dealing with attention and distraction, 4 groups were given the Color-Word test before and after different experimental conditions as one method of assessing experimental effects. None of the procedures influenced performance on the Color-Word test to any significant degree. The test-retest correlations for Color-Word scores of all groups were significant beyond the .01 level of confidence.—*W. H. Guertin.*

INTELLIGENCE & CREATIVITY

7990. Anderson, William F. (Syracuse U.) **Relation of Lorge-Thorndike Intelligence Test scores of public school pupils to the socio-economic status of their parents.** *J. exp. Educ.*, 1962, 31(1), 73-76.—For 598 5th and 6th graders, a high relationship was found between membership in 3 social classes and Lorge-Thorndike IQ. Unlike some previous work, this study found no superiority of non-verbal to verbal IQ in the lower class.—*E. B. Page.*

7991. Cattell, Raymond B. (U. Illinois) **Theory of fluid and crystallized intelligence: A critical experiment.** *J. educ. Psychol.*, 1963, 54(1), 1-22.—The theory of fluid and crystallized intelligence propounded 20 years ago by the author has since accumulated support. However, the crucial issue of whether 1 or 2 general factors subtend intellectual performances has lacked an experiment adequately designed for accurate, determinate, simple-structure rotation at the 2nd order. By factoring culturally embedded with culture-fair intelligence measures on a background of pure personality primaries ($N = 277$ 7th and 8th grade boys and girls), it is shown that 2 general factors indeed exist. A review, with some mathematical formulations, is given of the theory's implications for the nature-nurture ratio, brain injury, standard deviation of the IQ, growth curves, the concept of a relational difficulty hierarchy, test standardization, and the relative validities of traditional and culture-fair intelligence tests.—*Journal abstract.*

7992. Cipellini-Prunotto, A., & Pisanu, A. **Primi risultati sull'applicazione di un nuovo test individuale per la valutazione dello sviluppo mentale in soggetti in età prescolare.** [First results of applications of a new individual test for the evaluation of mental development in preschool children.] *Difesa. soc.*, 1962, 41(4), 122-130.—Description and standardization of a scale based upon studies of Piaget, Wallon, and Gesell that discriminates among various age ranges at the preschool level.—*L. L'Abate.*

7993. Clarke, P. R. F. (U. Sheffield) **Complexities in the concept of intelligence.** *Psychol. Rep.*, 1962, 11(2), 411-417.—"Following from the work of Cattell, Hebb, and Vernon, further complexities in concepts of intelligence are discussed. Distinctions are drawn between "raw score ability" and "normality of ability," between genetic and physiological aspects of intelligence A, and between the "nutritive" and "educative" effects of the environment. The problems presented by the concept of "potential" and the normal decline of test scores with age after maturity are considered."—*B. J. House.*

7994. Guthrie, George M. (Pennsylvania U.) **Structure of abilities in a non-western culture.** *J.*

educ. Psychol., 1963, 54(2), 94-103.—A battery of 50 tests including some tests in the Philippine dialect, Tagalog, was administered to 314 Philippine women college students. 22 factors were extracted. Verbal, numerical, rote memory, visualization fluency, and speed factors were found to be very similar to those found by others. Several factors were found which appeared to be a product of the Philippine educational tradition. Memory and reasoning factors were somewhat ambiguous. The Tagalog verbal factor was quite separate from the English verbal factor. Some implications for further research using more matching tests in the non-Western language were suggested. (23 ref.)—*Journal abstract.*

7995. Phatak, P. **Sex differences on Phatak's Draw-a-Man Scale.** *Educ. Psychol. Rev., Baroda*, 1962, 2(1), 24-29.—Sex differences in a sample of 8000 students showed that the mean scores of girls were consistently and statistically significantly less than those of boys, except at the age of 8. The differences are probably due to cultural and environmental forces.—*U. Pareek.*

7996. Semler, Ira J., & Iscoe, Ira. (Cedar Rapids Community School District, Iowa) **Comparative and developmental study of the learning abilities of Negro and white children under 4 conditions.** *J. educ. Psychol.*, 1963, 54(1), 38-44.—Object pairs and picture pairs of these same objects in conceptually similar or dissimilar sets provided 4 experimental conditions for comparing paired-associate learning of 135 Negro Ss with 141 white Ss across age levels 5 through 9 years. Despite significantly lower Full Scale WISC IQs ($p < .001$), the analysis of variance showed that differences in paired-associate learning favoring white Ss at younger age levels disappeared by 9 years of age ($p < .05$) with no race difference when the age factor was disregarded. Race differences in IQ were greatest at 5 years, however, negligible correlations were obtained between learning and IQ for both races (.094 and .189). Associating object pairs on conceptually similar sets was easiest and picture pairs in dissimilar sets most difficult for both races ($p < .001$).—*Journal abstract.*

7997. Stark, S. (Michigan State U.) **A note on time, intelligence, and Rorschach movement responses.** *Percept. mot. Skills*, 1962, 15(2), 267-272.—Psychology periodically has been observed to be indifferent to cognition oriented toward the future. However, on the basis of various positions taken during the past decade, it may now be argued that psychologists are beginning to redefine intelligence to accommodate foresight and planning. New Guilford instruments and the veteran Porteus Maze Test are attracting attention in this connection. The main argument of the present paper is that the movement scores of the Rorschach test, or the corresponding scores of any test which elicits without soliciting subjective motion, may be regarded as indices of aptitude for creative foresight and planning.—*W. H. Guertin.*

7998. Thorndike, Robert L. (Teachers Coll., Columbia U.) **The measurement of creativity.** *Teachers Coll. Rec.*, 1963, 64(5), 422-424.—Low correlations between subtests and between different tests of creativity suggest considerable tentativeness in using the word "creativity" as measured by tests now so labeled.—*H. K. Moore.*

7999. Triandis, Harry C., Bass, Alan R., Ewen, Robert B., & Mikesell, Eleanor Hall. (U. Illinois) **Team creativity as a function of the creativity of the members.** *J. appl. Psychol.*, 1963, 47(2), 104-110.—The relationship between team performance and individual abilities was studied with creative tasks. Data from 3 experiments are presented which indicate that the conclusions of other investigators, who used manual dexterity and cognitive tasks, can be applied to creative tasks. Up to about 70% of the variance in dyadic creativity may be predicted from the individual creative abilities of the 2 members. Multiple correlations for the prediction of group performance from the knowledge of the abilities of the members did not improve when the interaction between the ability scores was considered. In 1 experiment, in which the procedure permitted the determination of the relative "dominance" of the 2 Ss, the correlations of the abilities of the dominant Ss with group performance were higher than the correlations of the abilities of nondominant Ss with group performance. The study is a 1st step towards the determination of the relationship of group and individual performance in groups composed of more than 2 individuals.—*Journal abstract.*

8000. Tripathi, T. P. **A factorial study of the differentiation of abilities.** *Res. Stud., U. Allahabad*, 1962, 13, 1-11.—103 boys age 13+ were administered 8 tests of intelligence—BPT-7, Pidgeon's Non-Verbal Test, NIIP 70/23, NIIP Form Relations, PSTBI, a verbal meaning test, a number test, and a word fluency test. The scores of the tests were factor analyzed. The unrotated centroid factors were of little help. After rotation 4 factors were isolated and identified: general mental ability or "g," verbal ability or "v," spatial ability or "K," and number ability or "n." These abilities can be "measured effectively at the age of 13+."—*U. Pareek.*

PERSONALITY MEASUREMENT

8001. Bendig, A. W., & Martin, Ann M. (U. Pittsburgh) **The factor structure and stability of fifteen human needs.** *J. gen. Psychol.*, 1962, 67(2), 229-235.—A group of 135 statements representing 15 of Murray's needs had been developed by Wright and administered to college Ss ($N=127$). The same statements were administered to a new group of college Ss ($N=328$) and factor analyses performed on both matrices of interscale correlations. 4 factors were obtained from each sample which, after analytic rotation to oblique simple structure, showed almost identical scale loadings in both samples. Tentative identifications of the need syndromes shown by each factor as "achievement via independence," "obsessive-compulsive," "immature demands," and "social dependency" were suggested.—*Author abstract.*

8002. Graham, Warren R., & Johnson, Cecil D. (USA Personnel Research Office, Washington, D. C.) **An experimental comparison of inventory validity obtained before and after work experience.** *J. appl. Psychol.*, 1963, 47(1), 72-74.—Are responses to inventories more valid when obtained before work experience than after work experience? 2 long self-description inventories were administered to 537 soldiers. The same inventories were administered to 372 members of this sample 18 mon. later and 6 mon. after criterion ratings of performance on maneuvers

in Germany were obtained. The remaining 155 men could not be retested and were used to cross-validate the results. 19 short personality and interest keys and 2 total score keys were developed using the before-experience responses and then the after-experience responses. 2 of the 19 personality and interest keys and 1 of 2 total score keys showed statistically significant differences between validities for the before- and after-experience responses. The cross-validity of the regression composite based on before-experience responses was .23; on after-experience responses it was .26.—*Journal abstract.*

8003. Misra, R. G. (Bureau Psychology, Allahabad, India) **A factorial study of the stability of personality factors.** *Shiksha*, 1962, 15(2), 112-119.—Ascendancy, responsibility, emotional stability, and sociability of 26 graduate students were tested with items taken from Gattell's 16 Personality Factor test, Thorndike's Multidimensional Temperament Schedule, and Gordon Personal Profile. The results were factor analysed by using Thurstone's centroid method. The original 4 factors emerged, although the 4th factor (emotional stability) was hard to interpret. Sociability appears as seclusiveness; ascendancy as submissiveness; responsibility is clear; and emotional stability does not appear as a unique factor.—*U. Pareek.*

8004. Semeonoff, Boris. (U. Edinburgh, Scotland) **An application of inter-person analysis in personality assessment.** *Brit. J. Psychol.*, 1963, 54(1), 71-81.—A simplified form of factor analysis of persons was applied to test performance in a selection procedure associated with different patterns of 2-part self-description (i.e., as one might be seen by a friend, and as by a critic). Self-descriptions containing irrelevant or trivial features were shown to carry, on the whole, predominantly unfavourable implications. In most cases, however, minority groups were characterized by fairly consistent favorable patterns of test performance. Classifications based on the distribution of praise and criticism were also shown, in some cases, to be nonhomogeneous, and no single form of imbalance appeared to be uniformly unfavorable. In particular, role-reversal, as between the "friend" and the "critic," appeared to be a favorable rather than an unfavorable sign. The use of interperson analysis resolved certain anomalies which appeared in earlier studies by showing that these resulted from the mistaken assumption that a given self-description pattern had constant personality correlates.—*Journal abstract.*

8005. Zax, Melvin; Cowen, Emory L., & Peter, Mary. (U. Rochester) **A comparative study of novice nuns and college females using the response set approach.** *J. abnorm. soc. Psychol.*, 1963, 66(4), 369-375.—The vastly different type of life chosen by novice nuns and college females suggested personality differences which were thought likely to be reflected in response style. Accordingly, 40 Ss in each group were asked to rate each of the Rorschach inkblots on 21 semantic differential scales. It was found that the nuns generally rated the inkblots toward the more positive extreme of the evaluation scales and at times toward the more potent extreme of the potency scales. The generality of this tendency was assessed by comparing the social desirability (SD) ratings of 28 nuns to those of 28 college

females. It was again found that the nuns tended toward more extreme ratings. The introduction of the SD dimension resulted not only in more positively extreme ratings on adjectives ordinarily rated positively, but also more negatively extreme ratings on adjectives ordinarily rated as negative. Nuns were more variable than college females in rating nearly neutral adjectives. It was concluded that these tendency differences might be used as a basis for later prediction studies. (24 ref.)—*Journal abstract.*

Inventories

8006. Adams, Henry E., & Kirby, Albert C. (Louisiana State U.) **Manifest anxiety, social desirability, or response set.** *J. consult. Psychol.*, 1963, 27(1), 59-61.—The present investigation tested Edwards' hypothesis that the SD scale is not confounded with response set and determined the extent that response set contaminates Taylor's MA scale. By reversing the items of these scales, true and false scales for each personality scale were obtained. Statistical procedures were then utilized to determine response set and content scores for each scale. The results indicate that the MA scale is relatively free of response set and that the SD scale is measuring both response set and social desirability. It should not be assumed automatically that a scale which has items stated in a single direction is measuring response set or that a scale with items stated in both directions is not.—*Journal abstract.*

8007. Aiken, Lewis R., Jr. (Woman's Coll., U. North Carolina) **Frequency and intensity as psychometric response variables.** *Psychol. Rep.*, 1962, 11(2), 535-538.—"The effects of varying the response format, while holding the stimulus component of items constant, on scores on a 24-item anxiety inventory were studied. Two response formats were used, frequency (Never-Always) and Intensity (Mild-Intense). Four groups of 65 Ss each filled out one or both of the inventories in one of four orders (frequency-frequency, intensity-intensity, intensity-frequency, and frequency-intensity) over two time periods." The means of the 2 forms differed significantly, and the correlation between forms was less than the reliability of each. The frequency inventory was positively, the intensity inventory negatively, correlated with grades. "The study demonstrates that the kind of response called for on paper-and-pencil inventories affects the statistics and meaning of such devices."—B. J. House.

8008. Bendig, A. W. (U. Pittsburgh) **The factorial validity of the Guilford Zimmerman Temperament Survey.** *J. gen. Psychol.*, 1962, 67, 309-317.—The Guilford Zimmerman Temperament Survey was administered to 299 male college freshmen. Each scale was divided into 3 subscales; the 30 subscales were intercorrelated, and 10 1st-order centroid factors were extracted from the matrix. The factors were rotated to oblique simple structure using the oblimax criterion. The matrix of inter-factor correlations was further factored into 3 2nd-order factors which were also rotated to simple structure. The correlations among the 10 GZTS scales were factored into 4 factors and were rotated to simple structure. The analysis of the subscale intercorrelations demonstrated the factorial validity of the GZTS scales as each of the subscales loaded on only one factor and the sub-

scales from a given scale loaded on the same factor. The matrices of inter-factor and interscore correlations were almost identical. The loadings on the 2nd-order factors (Extraversion-Introversion, Social Activity, Emotionality, and Friendliness) were similar for both matrices with 1 exception; the Emotionality and Friendliness factors were combined in the inter-factor matrix due to the large correlation between these 2 factors for this sample of Ss.—*Author abstract.*

8009. Eysenck, Sybil B. G., & Eysenck, H. J. (Inst. Psychiatry, U. London, England) **The validity of questionnaire and rating assessments of extraversion and neuroticism, and their factorial stability.** *Brit. J. Psychol.*, 1963, 54(1), 51-62.—Groups of nominated extraverts and introverts, and of stable and neurotic Ss were given a 188-item questionnaire containing questions thought to be relevant to the measurement of these 2 dimensions of personality. Factor analyses were also carried out for 124 of these items making available factor loadings on these 2 dimensions. An analysis was carried out of the relationship between rated and self-rated behavior, and it was concluded that as far as extraversion was concerned, there was considerable agreement between these 2 methods of assessment. As regards neuroticism, agreement was much less close, and a theoretical explanation of this fact is given, supported by a special analysis of the empirical data. It was found that the factor analytic method of locating the E and N factors had considerable stability as from one study to another, in spite of considerable differences between the studies in choice of sample, choice of items, and other factors.—*Journal abstract.*

8010. Fröhlich, Werner D., & Wiskandt, M. (U. Bonn, Germany) **Untersuchung zur möglichen Altersabhängigkeit der Versuchseinstellung im Fragebogenexperiment.** [An investigation of the possible relationship of age and performance on personality inventories.] *Vita hum. Basel*, 1962, 5(3), 167-176.—70 Ss, 25-60 years of age and equally divided as to sex, were given a questionnaire consisting of the German version of Taylor's Manifest Anxiety scale, the L and K items of the MMPI, and ten of Eysenck's MMQ scale items, making a total of 105 test items. Analysis of the data revealed a significant correlation between the L score and age ($\rho = +.48$). The mean L score of the younger group (25-35) was significantly lower than that of the older group (35-60) when the population was divided into 7 5-year age groups. Scores on the Manifest Anxiety and K scales were independent of age though the correlation between them was significant but negative.—J. L. Yager.

8011. McDonald, Robert L., & Gynther, Malcolm D. (Medical Coll. South Carolina) **MMPI differences associated with sex, race, and class in two adolescent samples.** *J. consult. Psychol.*, 1963, 27(2), 112-116.—This study was designed to determine if Negroes and whites perform differently on the MMPI with socioeconomic status controlled. The sample of 360 was drawn from high school seniors attending segregated southern schools. Class categorization was based on parental occupation. Analyses of variance and supplementary "t" tests showed that Negro students obtained higher scores than whites on Scales L, F, 1, 2, 5, 8, and 9 and lower

scores on Scale 3, and males obtained higher scores than females on Scales 1, 2, 5, 7, and 9 and lower scores on 0, but that no differences were attributable to the class factor. It was hypothesized that the Negro-white differences reflect distinctive cultural patterns. The development of separate MMPI norms for Negroes was recommended. (15 ref.)—*Journal abstract*.

8012. Pierce-Jones, John; Mitchell, James V., Jr., & King, F. J. (U. Texas) **Configurational invariance in the California Psychological Inventory.** *J. exp. Educ.*, 1962, 31(1), 65-71.—This investigation of the CPI was designed to determine the factorial composition of the inventory's 18 scales for a sample of 156 city school superintendents and to compare the factors so found with those obtained in an earlier factor study of 258 undergraduates, "mostly women. In both studies, identical centroid analysis and varimax rotation yielded 4 CPI factors. Ahmavaara transformation analysis indicated that 2 factors were virtually identical and 2 understandably less similar.—E. B. Page.

8013. Stricker, Lawrence J. (Educational Testing Service, Princeton, N. J.) **Note on social desirability response style and learning.** *J. educ. Psychol.*, 1963, 54(1), 52-56.—In Brown's [see 34: 3531] study of the learning of personality items which were paired with nonsense syllables, a major finding was that social desirability response style was related to learning measures for women but not men. A reanalysis of these results found that social desirability response style was related to delayed recall for both men and women, and confidence and immediate recall for women only. It was noted related to trials to mastery, learning time, and blockings. It was concluded that this study partially supports Edwards' social desirability response style reinterpretation of studies of anxiety and learning, but that many previous studies do not.—*Journal abstract*.

8014. Wiggins, Jerry S. (U. Illinois) **Social desirability under role playing instructions: A reply to Walker.** *J. consult. Psychol.*, 1963, 27(2), 107-111.—Wiggins (1959) found that Edwards' SD scale was not effective in distinguishing MMPI records of Ss instructed to answer in terms of social desirability from records of other Ss not so instructed. Walker (see *J. consult. Psychol.*, 1962, 26(2), 162-166) has criticized Wiggins' study on both procedural and interpretative grounds and reported findings of a redesigned replication that suggest SD can perform this discrimination. It was argued that given (a) the actual development of the SD scale, (b) the success of other desirability scales in both studies, (c) the similarity of control scales in both studies, and (d) Walker's failure to control for the test-retest "improvement" effect, Walker's conclusions cannot stand, and his defense of the SD scale must be judged unsuccessful.—*Journal abstract*.

Projective Methods

8015. Avila, D. L., & Lawson, J. R. (U. Nebraska) **The Thematic Apperception Test as a diagnostic tool with retarded adults.** *Percept. mot. Skills*, 1962, 15(2), 323-325.—15 retarded males and 9 females, ranging in age from 16 to 44 and having IQs from 50 to 89, were administered the TAT.

Their responses were evaluated in terms of the quantity and quality of response and the relationship of these 2 variables to age, sex, and intelligence. The resulting data appear to support the hypothesis that the TAT is of limited value in ascertaining the needs or personality structure of the retarded individual. This seems to be true, at least with respect to Ss in this study, regardless of age, sex, or intelligence.—W. H. Guertin.

8016. Block, W. E. (Yeshiva U.) **Preliminary study of adaptation level theory as a framework for projective testing.** *Percept. mot. Skills*, 1962, 15(2), 366.—The paradigm of adaptation-level was applied to projective testing on the assumption that response to the projective technique is structurally similar to the types of judgments made in psychophysics. 20 Ss rated the Rorschach inkblots after giving free responses on an evaluative scale of the semantic differential whose bipolar adjectival anchors were "pleasant" and "unpleasant." The prevailing adaptation-level or neutral Ss' original mean judgments were then postdicted on the assumption that they had been made with respect to a framework of reference determined by the adaptation-level, as suggested by theory. The hypothesis that test responses follow the psychophysical paradigm of adaptation-level was confirmed.—W. H. Guertin.

8017. Jakab, Irène. **Représentation consciente et inconsciente de soi-même dans les figures humaines dessinées.** [Conscious and unconscious self-representations in human figure drawings.] *Confin. psychiat.*, Basel, 1962, 5(2-3), 112-129.—When asked to draw a self-portrait, mental patients generally depict themselves as participant in a situation. Only rarely do they show feeling as facial expression. Hallucinations and pathological body experiences may be depicted, for example, by showing a snake in the self-figure's abdomen or "magic waves" that pass through the figure. Physically handicapped figures endow other figures with their own infirmities. And when asked to draw a "beautiful" figure, nonhandicapped children drew significantly more human figures than did physically handicapped children.—E. W. Eng.

8018. Langer, Philip. (Utah State U.) **Social desirability and acquiescence on the SORT.** *Psychol. Rep.*, 1962, 11(2), 531-534.—"Seventy-four Ss at Utah State University were administered the Gough Adjective Checklist and the SORT [Structured Objective Rorschach Test]. Agree-disagree and social desirability scores were derived from the Gough and correlated with W and Dd responses on the SORT. The two significant rhos were presumed to reflect chance. Cronbach's warnings about the limitations of set generalization were discussed, and the interaction between cognitive styles and test variables was offered tentatively as an explanation for the phenomenon of response set."—B. J. House.

8019. Miller, L., & Salomon, F. **Test de Rorschach de médecins praticiens.** [Rorschach test of practicing physicians.] *Bull. Soc. Franc. Rorschach Meth. Proj.*, 1962, No. 13-14, 20-27.—Protocols of 20 practicing physicians and 10 physicians not in practice were used to indicate probable characteristic responses of physicians for comparison with similar data from those in other professions. Tentative conclusions are that physicians have greater W% and less D%, few M, relatively numerous CF, and some S.

Differences between practicing and nonpracticing physicians are noted.—S. S. Marzolf.

8020. Satz, P., & Carroll, L. T. (VA Hosp., Lexington, Ky.) **Utilization of the Proverbs Test as a projective instrument: An objective approach through language behavior.** *J. gen. Psychol.*, 1962, 67(2), 205-213.—This study attempts to construct an objective measuring instrument for investigating certain personality variables through language behavior. The Proverbs Test by Gorham (1956) was used as the independent variable; however, scoring was based on the unique language productions elicited by the proverb stimuli. 7 type frequency scoring categories were defined and classified. The test was standardized on a university sample ($N=179$) and a schizophrenic sample ($N=58$). Independent tests for category discreteness, reliability, objectivity, and validity were obtained. Results yielded substantial support for all tests with the exception of validity. More tenable support for category validity came through the study of known groups.—*Author abstract.*

8021. Schüling, Hermann. (Marktstr. 4, Giessen, Germany) **Psychologie der thematischen Apperzeption.** [Psychology of thematic apperception.] *Z. exp. angew. Psychol.* 1962, 9(4), 625-666.—Within the framework of a theory of expression 2 aspects of apperception are distinguished: the material and the formal. While most theories of expressive behavior exclude the theme, the material aspect, from consideration, emphasis is placed on its inclusion in the analysis. It should be regarded as expression of personality also. The theme of the apperception allows recognition of individual drive and ego structure, prevailing emotional mood, and social attitudes.—*W. J. Koppitz.*

8022. Wylie, Ruth C., Sisson, Boyd D., & Taulbee, Earl. (Goucher Coll.) **Intraindividual consistency in "creative" and "memory" stories written for TAT pictures.** *J. consult. Psychol.*, 1963, 27(2), 145-151.—108 college women wrote at 2 sittings, either following the usual (creative) instructions both times, providing reliability data, or following "creative" instructions one time, drawing stories from memory the other. Memory sources were varied in 2 subconditions. Aggression and Dependency scores were used in separate tests of the clinically assumed hypothesis that it makes no difference diagnostically whether S is being creative or drawing stories from memory. When correlating scores from 2 types of instructions, card set and session number were balanced. Intraindividual consistency is low or zero under all conditions, despite reliable scoring. Aggression rs are larger than Dependency rs. The data do not justify using the TAT as scored here for individual diagnosis.—*Journal abstract.*

PERSONALITY DIAGNOSIS

8023. Grebstein, Lawrence C. (VA Hosp., Lexington, Ky.) **Relative accuracy of actuarial prediction, experienced clinicians, and graduate students in a clinical judgment task.** *J. consult. Psychol.*, 1963, 27(2), 127-132.—3 groups of judges, varying in amounts of clinical experience, predicted Wechsler-Bellevue IQ scores from Rorschach psychograms in competition with a multiple regression equation. The results indicated that: (a) There was no

significant difference between the degree of accuracy of the judgments of the equation and of the clinicians. (b) The judges and the multiple regression equation were able to judge IQ scores significantly better than chance, (c) Clinical predictive accuracy, as indicated by high positive correlations between predicted and actual IQ scores and low average error scores, did not increase significantly with amount of clinical experience.—*Journal abstract.*

8024. Rümke, H. C. (Mariahock 4, Utrecht, Netherlands) **Die Bedeutung von Phenomenologie und Beschreibung in der Psychiatrie.** [The significance of phenomenology and description in psychiatry.] *Z. Psychother. med. Psychol.*, 1962, 12(3), 94-102.—Description of a phenomenon never reproduces the phenomenon itself in its totality. Isolation of a phenomenon without any frame of reference can never produce a valid description. Descriptive methodology in psychiatry proved fruitful—among others—in dealing with endogenous versus organic psychoses. The description should also include what the patient is lacking and what is going on in the examiner. A description within one frame of reference should not be looked upon as representing the whole. At any rate, a good description of the manifest will always remain valuable, while the theories of "depth" may disappear.—*I. Neufeld.*

8025. Smith, Aaron; Smith, Robert; Sanders, Richard; Weinman, Bernard; Kenny, Janice, & Fitzgerald, Bernard. (Philadelphia State Hosp.) **Predicting the outcome of social therapy with chronic psychotics.** *J. abnorm. soc. Psychol.*, 1963, 66(4), 351-357.—A group of 69 male, long-hospitalized chronic psychotics in an experimental rehabilitation unit was tested on a new device, the Hunter problem box, prior to their treatment by 1 or 3 variants of social therapy. A summary score, the Hunter Process Index, was developed to relate to patients' postprogram adjustment on completion of a social therapy program. The index reflects changes in the degree of problem solving rigidity displayed by the patient as he moves from a simple, 2-light, single alternation problem to a more complex, 4-light, double alternation problem. The Hunter Process Index was validated with a group of 71 long-hospitalized, female psychotics who also had been exposed to the social therapy approach of the rehabilitation unit, and again with a group of 48 male chronic psychotics who had received some slight variation in the program. The index scores were predictive of the outcome of patients in these groups. Clinical judgments failed to predict outcomes. A normal control group in a separate study earned better Hunter index scores than did either the released or hospitalized groups of male chronic psychotics.—*Journal abstract.*

PERSONALITY ADJUSTMENT

8026. Buss, Arnold H., & Brock, Timothy C. (U. Pittsburgh) **Repression and guilt in relation to aggression.** *J. abnorm. soc. Psychol.*, 1963, 66(4), 345-350.—College men and women who were opposed to electric shock in research were instructed to deliver intense shock to others (victims). Before administering shock $\frac{1}{2}$ the Ss read a positive communication (shock is beneficial) and the other $\frac{1}{2}$, a negative communication (shock is harmful). There was signif-

icantly less recall of the negative communication. For the same-sex pairs (male S-male victim and female S-female victim) the positive communication elicited significantly more guilt and opposition to shock than did the negative communication; for opposite-sex pairs the results were reversed. These findings could be explained by cognitive dissonance theory or by an identification hypothesis.—*Journal abstract.*

8027. English, O. Spurgeon, & Pearson, Gerald H. J. *Emotional problems of living.* (3rd ed.) New York: Norton, 1963. x, 624 p. \$7.50.—Psychoanalytically oriented discussion of normal and abnormal personality development from birth to old age. Particular emotional disturbances are correlated with different periods of development, i.e., early and later childhood, adolescence, adulthood, and old age. Specific chapters are devoted to marriage and sexual adjustment, maturity, mental illness, and treatment.—*D. G. Brown.*

8029. Feather, N. T. (U. New England, New South Wales, Australia) *The relationship of expectation of success to reported probability, task structure, and achievement related motivation.* *J. abnorm. soc. Psychol.*, 1963, 66(3), 231-238.—Male students estimated their chances of success before performing an anagrams task. 3 reported probabilities of success (.20, .50, and .80) were combined with 3 lengths of the puzzle (8, 11, and 14 anagrams), and 14 Ss were randomly assigned to each of the 9 experimental conditions. Probability estimates were found to increase as reported probabilities increased ($p < .001$) and as the list of anagrams became shorter ($p < .025$). Ss tended to overestimate chances of success for the .20 reported probability and to underestimate chances for the .80 reported probability ($p < .001$). Probability estimates were negatively related to debilitating anxiety ($p < .05$) and positively related to facilitating anxiety ($p < .025$), but correlations were very low. Results are taken to indicate the dominant role of past experience in shaping present expectations. (34 ref.)—*Journal abstract.*

8029. Fisher, Seymour. (Upstate Medical Cent. State U. New York) *A further appraisal of the body boundary concept.* *J. consult. Psychol.*, 1963, 27(1), 62-74.—A series of studies were reviewed which cross-validated and extended previous findings concerning the relationship of two measures of body image boundary definiteness (barrier and penetration scores) to various levels of behavior. Support was found for the view that the more definite an individual's boundaries the more likely he is to manifest relatively higher physiological reactivity in body exterior as contrasted to body interior sectors. There was substantial evidence too that with increasing boundary definiteness there is greater ability to adjust adequately to disablement of one's body, to maintain normal ego integration, and to be effectively communicative in small group settings. Finally, the rationale was discussed for interpreting the barrier and penetration scores within a body image framework. (46 ref.)—*Journal abstract.*

8030. Hamilton, M., Pond, D. A., & Ryle, A. (25 Caversham Rd., London, England) *Relation of C.M.I. responses to some social and psychological factors.* *J. psychosom. Res.*, 1962, 6(3), 157-165.—

The Cornell Medical Index responses of 146 adults were related to their childhood experience and marital adjustment. High scores were associated with the recollection of emotionally disturbed childhood homes and in women, with poor marital adjustment. High scoring women reported many functional physical symptoms. Higher "psychiatric" scores went with more numerous physical symptoms. (18 ref.)—*W. G. Shipman.*

8031. Herron, W. G. (St. Bonaventure U.) *IES Test patterns of accepted and rejected adolescents.* *Percept. mot. Skills*, 1962, 15(2), 435-438.—The IES Test was administered to a group of rejected adolescents and a group of accepted adolescents to estimate the effect of parental rejection on personality functioning. The Picture Story Completion and the Picture Title subtests were the most sensitive to personality differences, though some individual items on all tests were of discriminative value. The rejected adolescent displayed a weak ego, restricted in its integrative capacity by either impulse demands or super-ego limitations. This confirmed the hypothesized effect of rejection and indicated the evaluative capacity of the IES test.—*W. H. Guertin.*

8032. Jessor, Richard; Liverant, Shephard, & Opoichinsky, Seymour. (U. Colorado) *Imbalance in need structure and maladjustment.* *J. abnorm. soc. Psychol.*, 1963, 66(3), 271-275.—4 studies are reported which replicate the test of the hypothesis that extreme imbalance within a need structure is associated with poorer adjustment. The Rotter Incomplete Sentences Blank (ISB) was the adjustment-maladjustment measure. Imbalance in need structure was measured by Liverant's Goal Preference Inventory which assesses the relative strength of Affection and Recognition needs. Extremely imbalanced and extremely balanced need groups were compared on ISB scores in each of the 4 independent studies. All results were in the predicted direction, with 11 out of 16 comparisons statistically significant. Within the limitations of the measures, the studies provide support for the hypothesis that a structural characteristic of a personality need system—extreme imbalance—is associated with poorer adjustment.—*Journal abstract.*

8033. Levy, L. H. (Indiana U.) *Age and personal need correlates of expectancy for change.* *Percept. mot. Skills*, 1962, 15(2), 351-356.—Defining expectancy for change as the probability held by an individual for the occurrence of a novel or different state of affairs from that now existing in a given situation and summed over a variety of situations, an instrument called the Event Anticipation Survey was developed. Comparing a college student group with an aged group, no differences were found in mean expectancy for change and EPPS need scores for the college group yielded significant correlations for the following needs: Dominance, -.35; Change, .29; Intracception, .23; and Deference, -.22. The possible meaning of these correlations as well as the implications of other findings of this study for the construct of expectancy for change were discussed.—*W. H. Guertin.*

8034. Stekel, Wilhelm. *Compulsion and doubt.* (Trans. by Emil A. Gutheil) New York: Grosset & Dunlap, 1962. 645 p. \$2.45.—A paperback edition of the book originally published in 1949.

Anxiety

8035. Kamano, Dennis K. (Galesburg State Research Hosp.) Relationship of ego disjunction and manifest anxiety to conflict resolution. *J. abnorm. soc. Psychol.*, 1963, 66(3), 281-284.—The purpose of this study was to discover the influence of 2 determinants, ego disjunction (ED) and manifest anxiety (MA), on conflict resolution. ED, defined as antagonistic response tendencies within an individual, was measured by the Edwards Personal Preference Schedule, and MA by the Taylor MA scale. From a sample of 56 college Ss, it was found that Ss high in both ED and MA required significantly more time to resolve approach-approach and avoidance-avoidance conflicts than Ss high in only one determinant but low in the other and Ss low in both determinants. No significant differences in conflict scores were found when Ss low in both determinants were compared with Ss high in only one determinant but low in the other. The results were interpreted as indicating that ED and MA interact, producing interfering responses which hinder efficient resolution of conflicts when ED and MA are both high within an individual. High MA and high ED scores, when taken alone, did not yield any conclusive results. It is only when both determinants are taken into consideration that greater confidence can be invested in those measures to predict conflict performance.—*Journal abstract.*

8036. Milliken, Robert L., & Spilka, Bernard. (Purdue U.) Mathematical-verbal ability differentials and somatic expressions of situational anxiety. *J. exp. Educ.*, 1962, 31(1), 3-26.—48 Ss were divided into ability groups of high verbal-low math, high math-low verbal, and equal verbal-math skills. Physiological measures were recorded during testing including verbal and mathematical material. Some support was given to the hypothesis that anxiety would be indicated during testing of an individual's deficient area.—*E. B. Page.*

8037. Sweetbaum, Harvey A. (Montgomery County Health Dept., Rockville, Md.) Comparison of the effects of introversion-extraversion and anxiety of conditioning. *J. abnorm. soc. Psychol.*, 1963, 66(3), 249-254.—This study investigates the effects of Eysenck's introversion-extraversion theory and Spence-Taylor's concept of anxiety on the eye-blink conditioned response by varying these factors independently. 56 patients were subjected to conditions of high and low anxiety. Group I (anxious group) were about to undergo major surgery; Group II (nonanxious group) were patients who had successfully recovered. These patients were divided into high introverts and high extraverts, yielding 4 groups (anxious introverts, anxious extraverts, nonanxious introverts, nonanxious extraverts). The anxious groups showed greater conditioning than the non-anxious groups and no significant differences were found between the high and low introvert groups, supporting the hypothesis that total drive is, in part, a function of internal anxiety. (19 ref.)—*Journal abstract.*

Defenses

8038. Bramel, Dana. (U. Minnesota) Selection of a target for defensive projection. *J. abnorm. soc. Psychol.*, 1963, 66(4), 318-324.—This hypothesis was tested and supported ($p < .05$): a person receiv-

ing unambiguous undesirable information about himself which is dissonant with his self-concept is more likely to project the attribute onto persons in his own social category than onto outgroup members. Each college student S was told either that he was lacking in or that he possessed homosexual motivation; he then rated the homosexuality of a speaker telling TAT stories on a tape recording. $\frac{1}{2}$ of the Ss believed the speaker was another student; $\frac{1}{2}$ believed he was a criminal. Attribution of homosexuality was a positive function of dissonance only when the speaker was seen as a student. Projection onto the student was greater among Ss with higher self-esteem.—*Journal abstract.*

PSYCHOANALYTIC THEORY

8039. Dominian, J. *Psychiatry and the Christian*. New York: Hawthorne, 1962. 135 p. \$3.50.—The author, a psychiatrist educated by Marists and Jesuits, writes for those wishing "a Christian evaluation of psychoanalysis." The 11 chapters fall into 4 sections: (a) pioneers in personality theory ("History of Psychological Medicine," "Foundations of Personality"), (b) pathology ("Psychoses," "Neurotic and Personality Disorders," "Sexual Problems," "Alcoholism"), (c) therapies ("Therapeutic Methods," "Child Psychiatry"), and (d) the religious view ("Responsibility," "The Role of the Priest," "Christianity and Psychiatry").—*A. Eglash.*

8040. Erikson, Erik H. *Young man Luther: A study in psychoanalysis and history*. New York: Norton, 1962. 288 p. \$1.75 (paper).—A paperback edition of a book first published in 1958.

8041. Farrell, B. A. (Oxford U.) Can psychoanalysis be refuted? *Inquiry*, 1961, 4(1), 16-36.—This paper examines the challenge that psychoanalytic theory cannot be refuted. It does so by considering the theory in its orthodox Freudian form, and in the main branches into which it can be divided—the theories of instincts, development, psychic structure, mental economics or defense, and symptom formation. The essential character of the generalizations and concepts of these branches is indicated, and the possibility of refuting each branch is considered. A considerable amount of scientific inquiry has been done into the concepts and generalizations of psychoanalysis. Relevant examples of these inquiries are noted, and the question is asked whether these scientific studies have in fact done anything to refute or support the various branches of psychoanalytic theory. The general conclusion is that the challenge is both important and a mistake.—*C. T. Morgan.*

8042. Jung, C. G., & Kerenyi, C. *Essays on a science of mythology*. New York: Harper & Row, 1963. 200 p. \$1.85 (paper).—A paper edition of the book originally published in 1949.

8043. Ramzy, Ishak. (Topeka, Kan.) Research aspects of psychoanalysis. *Psychoanal. Quart.*, 1963, 32(1), 58-76.—The problems inherent in psychoanalytic research are discussed. "The answers to the core questions of psychoanalysis have to be sought from within psychoanalysis itself. . . . It is hoped that we shall find it worth while to start by giving as much—or even more—attention to the investigation of method as we give to exploration of theory or to work on problem-centered research. It is method that defines problems and clarifies theory."—*J. Z. Elias.*

PHYSIOLOGICAL CORRELATES

8044. Baines, R. D., Guerink, N. A., & Schottstaedt, W. W. (U. Oklahoma Medical Cent.) Renal clearances of insulin and PAH associated with the stress of mental concentration. *Psychosom. Med.*, 1962, 24(6), 584-589.—Measures of kidney functioning (insulin and para-amino hippuric acid) were taken on 12 male patients without cardiac or kidney disease before, during, and after a speed-of-perception test (concentration stress). 4 control cases were run without the stress. An adjective checklist indicated more "tension" during the stress. While the controls had steady renal functioning the stress cases dropped in glomerular filtration rate and renal plasma flow. Conclusion: feelings of tension seem accompanied by decreased renal blood flow.—*W. G. Shipman.*

8045. Fiorica, V., & Muehl, S. (U. Iowa) Relationship between plasma levels of 17-hydroxycorticosteroids (17-OHCS) and a psychological measure of manifest anxiety. *Psychosom. Med.*, 1962, 24(6), 596-599.—There was a statistically significant difference in 17-OHCS level between the 19 introductory psychology students scoring highest and the 31 scoring lowest on the Taylor MA scale.—*W. G. Shipman.*

8046. Johannsen, W. J., Friedman, S. H., Feldman, E. I., & Negrete, A. (Wood VA Hosp., Milwaukee, Wis.) A re-examination of the hippuric acid-anxiety relationship. *Psychosom. Med.*, 1962, 24(6), 569-578.—3 measures of hippuric acid excretion were obtained from 45 hospitalized neurotics. These measures correlated .25-.30 with clinical interview ratings, .21-.27 with the Forced Choice MA scale, .37-.41 with the MA scale, and .06-.40 with other MMPI anxiety-related scales. In contrast to earlier work, the amount of excretion was unaffected by age, weight, and body surface area. (23 ref.)—*W. G. Shipman.*

THERAPY & GUIDANCE

8047. Sundberg, Norman D., & Tyler, Leona E. (U. Oregon) Clinical psychology: An introduction to research and practice. New York: Appleton-Century-Crofts, 1962. xviii, 564 p. \$7.00.—Written primarily for the beginning graduate student, "the whole framework of the book rests on a developmental approach, "focusing on a research orientation rather than technical skills. Clinical service and inquiry are related to decisions made by clinicians and patients in the course of assessment and therapy. Annotated references to suggested readings and research examples accompany most chapters. Appended are a list of tests, guide to history-taking, and indices of research and case examples. (30-p. ref.)—*H. P. David.*

8048. Tourlentes, T. T., Pollack, S. L., & Himwich, H. E. (Eds.) Research approaches to psychiatric problems: A symposium. New York: Grune & Stratton, 1962. ix, 238 p. \$5.50.—These papers and discussions constituted the 10th Anniversary (1960) Symposium of the Galesburg State Research Hospital. Following an introductory paper by H. W. Magoun on the development of concepts of organization and function of the brain, there are re-

ports on biochemical, genetic, psychologic, physiologic, and sociologic studies by M. Vogt; H. E. Lehmann, T. A. Ban, W. G. Boll, O. Ast, G. Nogradi, S. Sved, and J. St-Laurent; F. J. Kallmann; J. D. Benjamin; A. B. Hollingshead; J. S. Gottlieb and C. E. Frohman; J. T. Shurley; M. S. Zaks; R. Bird-whistell; F. Alexander; and H. F. Harlow. The papers serve primarily as reviews of the literature, of concepts, and often of the personal research efforts of the respective writers. The presentations generally are adequately documented with bibliographical references, even for the discussion sections. The one paper which may seem unusual to psychologists is that by Lehmann and his co-workers. Among their studies of psychotropic drug effects are: (a) the use of firefly tail extract in enzyme catalyzed reactions, (b) proteus bacteria, (c) carcinoma cells, (d) oat seedlings, (e) the hydra feeding reflex, and (f) dandelion sleep movements.—*I. N. Mensh.*

MEDICAL THERAPIES

Drug Therapy

8049. Hetherington, Ralph. (Liverpool U., England) Preoperative medication and memory: Pilot study. *Psychol. Rep.*, 1962, 11(2), 352.—"Results suggest . . . two qualitatively different kinds of post-operative amnesia: total amnesia related to the use of morphine and vespral (5 out of 26 cases) and partial amnesia related to the use of morphine and atropine (4 out of 29 cases)."—*B. J. House.*

8050. Horne, E. Porter, & Deabler, Herdis L. (U. Florida) Optimal beta motion in patients receiving insulin and chlorpromazine. *J. gen. Psychol.*, 1962, 67(2), 265-269.—Flash rate for perception of optimal motion was obtained from patients and hospital aides, as follows: (a) 23 patients showing good recovery from insulin, (b) 10 patients in immediate recovery phase from insulin, (c) 32 patients receiving chlorpromazine prescribed between 100 and 800 mgm. daily, (d) 29 organic patients, and (e) 12 hospital aides. Mean rate and % of cases for Ss perceiving motion on 50% or more trials for the groups of Ss were compared by t-tests. Beta motion was perceived readily at a fast rate by normal Ss. Patients on insulin treatment at least temporarily report a higher sensitivity to motion perception. The effect of tranquilizing drugs was in the direction of a lowered Beta motion perception and was more like that found in organic patients than in normals.—*Author abstract.*

8051. Palmieri, V. C. Questioni medico-legali afferenti l'uso dei farmaci psicotropi. [Medical and legal questions concerning the use of psychotropic drugs.] *Difesa. soc.*, 1962, 41(3), 7-28.—Psychotropic substances are subdivided into psycholeptic, psychoanaleptic and psychodysleptic drugs. Their use, abuse, dangers, contraindications, as well as their clinical, anatomical, and pathological effects are underlined. Uncontrolled use of psychotropic drugs produce the following medical and legal problems: (a) carelessness of prescription by physician, (b) lack of diagnosis of the disease, (c) omission of miorelaxant drugs in electroshock, (d) early dismissal of a tranquillized psychotic patient, (e) imprudent use of drug not yet completely experimented, (f) possible allergies, (g) simulation of neuroleptic conditions, (h) diagnosis of usage for athletes, and (i)

transitory changes in the capacity to understand and decide on the specific effect and side-effect of each drug.—*L. L'Abate.*

8052. Shaffer, John W., & Wolf, Sidney. (Spring Grove State Hosp., Md.) Attitude toward mental hospitals as an index of tranquilizing drug activity. *Psychol. Rep.*, 1962, 11(2), 403-405.—A group of 19 alcoholics treated with a placebo for 30 days showed a shift toward unfavorability of attitude toward mental hospitals and a significantly greater variance. 45 alcoholics treated with chlorthalidone showed no shift in attitude, but significantly less variance after 30 days. It was concluded that the drug is active.—*B. J. House.*

8053. Venturi, V. M. Farmaci psicomimetici e comportamento umano. [Psycho-active drugs and human behavior.] *Difesa. soc.*, 1962, 41(4), 7-20.—After a brief historical review of psychoactive drugs, they are classified according to their therapeutic effects. Behavioral toxicity can be based upon: occasional clinical observations, experiments on psychiatric patients, studies on healthy Ss, and research on laboratory animals. The advantages, shortcomings, and uncertainties of these different conditions are discussed.—*L. L'Abate.*

Shock Therapy

8054. Crumpton, Evelyn; Brill, Norman Q., Eiduson, Samuel, & Geller, Edward. The role of fear in electroconvulsive treatment. *J. nerv. ment. Dis.*, 1963, 136(1), 29-33.—The role of fear in electroconvulsive treatment (ECT) was studied in a group of 96 hospitalized male veteran psychiatric patients who were administered a course of oral or simulated ECT. While fear was found to be universally present, there was no evidence of a relationship degree of fear of ECT and psychiatric improvement nor between improvement and notions of guilt, punishment, or death-birth fantasies.—*N. H. Pronko.*

8055. Thorpe, J. G. (Banstead Hosp., Sutton, Surrey, England) The current status of prognostic indicators for electroconvulsive therapy. *Psychosom. Med.*, 1962, 24(6), 554-568.—"The literature on ECT prognostic indicators has been reviewed in relation to the following tests: the Funkenstein test, the sedation-threshold test, the amylal test, EEG responses, and psychological tests. No single test has yet been shown to have adequate reliability and/or validity" for ECT outcome prognosis. (54 ref.)—*W. G. Shipman.*

PSYCHOTHERAPY

8056. Anderson, A. Russell, & McLaughlin, Francis. (Baltimore, Md.) Some observations on psychoanalytic supervision. *Psychonal. Quart.*, 1963, 32(1), 77-93.—"Certain general principles relating to the functions and aims of supervisory analysis are discussed."—*J. Z. Elias.*

8057. Cantoni, Louis J., & Cantoni, Lucile. (Wayne State U.) Augmenting the psychotherapist's role. *Education*, 1962, 83(2), 102-104.—Attention is given to the difficulties a lay person may encounter in referring a friend to a psychotherapist. The layman who makes such a referral can facilitate the work of the professional therapist by reassuring his friend, when such reassurance is needed, that the

therapist is competent, concerned, and someone who can help him resolve serious personal problems.—*Author abstract.*

8058. Cartwright, Rosalind Dymond, & Lerner, Barbara. (U. Illinois Coll. Medicine, Chicago) Empathy, need to change and improvement with psychotherapy. *J. consult. Psychol.*, 1963, 27(2), 138-144.—To study the influence of: the patient's need to change, the therapist's experience level, the empathic understanding of the therapist, the sex of the patient and therapist, and the amount of psychological distance between them, on psychotherapy improvement, 28 patients in client-centered counseling were tested before and after therapy with scales built from the Kelly Role Construct Repertory Test. Patients' initial need to change was found to be directly related to improvement. Therapists' final level of understanding was also directly related. Patient's need and therapist's empathy considered jointly produced a prediction model for therapy length and success. 2 success groups were found: same-sex patients of experienced therapists whose distance from him the therapist initially reduced, and opposite-sex patients of inexperienced therapist whose distance from him the therapist initially increased.—*Journal abstract.*

8059. Feldstein, Stanley, & Jaffe, Joseph. (William Alanson White Inst., NYC) Language predictability as a function of psychotherapeutic interaction. *J. consult. Psychol.*, 1963, 27(2), 123-126.—An inverse relationship was hypothesized between number of psychotherapeutic interviews and therapists' errors in predicting their patients' speech. Recorded speech samples were obtained from Ss before their 1st psychotherapeutic interviews, and immediately after their 10th, 20th, and 30th interviews. The samples were transcribed verbatim, mutilated according to the Cloze Procedure and sent to the Ss' therapists and to 2 groups of therapists who served as controls. Instructions were to guess the deleted words. The returned transcriptions were scored for proportions of incorrect guesses. A trend analysis of the data did not support the hypothesis, although the therapists were found to be better predictors of their own patients' speech than of other patients' speech.—*Journal abstract.*

8060. Stokvis, B. Psychotherapie und Psychopharmakologie bei Psycho- und Somatoneurotikern: Heil-Erfolge oder Schein-Erfolge? [Psychotherapy and psychopharmacology in psycho- and somatic neurotics: Real or apparent cure?] *Acta psychother. psychosom.*, Basel, 1962, 10(3), 246-264.—"False positive results" following use of drugs is a conceptual error. In psychotherapy there are also "false cures" (spontaneous cures or improvements). Psychosomatic illness often shows improvement without psychotherapy. However, the author also warns against premature conclusions against psychotherapy.—*G. Rubin-Rabson.*

8061. Wolstein, B. Irrational despair. New York: Free Press Glencoe, 1962. 200 p. \$6.09.—This work criticizes the philosophy of existential analysis, particularly as it is adapted to psychotherapeutic practice. The author believes this philosophy to be self-contradictory and to lead to a personal position of irrationalism and meaningless despair.—*G. Elias.*

Therapeutic Process

8062. Frankl, Liselotte, & Hellman, Ilse. Symposium on child analysis: II. The ego's participation in the therapeutic alliance. *Int. J. Psychoanal.*, 1962, 43(4-5), 333-337.—Interpretations in child analysis should be geared to the patient's ego development (the part of the personality to which interpretations are conveyed), rather than to his age level, since the age and ego developments of a child are apt to differ.—G. Elias.

8063. Garma, A. The curative factors in psychoanalysis: Contributions to discussion. *Int. J. Psychoanal.*, 1962, 43(4-5), 221-224.—The most common mistake of interpretation which the author found among students of psychoanalysis lay in their attributing repressed aggression to behavior which reflected masochistic aggression. Understanding the role of the death instinct in psychoanalysis will help the analyst recognize masochistic behavior when it occurs.—G. Elias.

8064. Gitelson, M. The curative factors in psychoanalysis. Part I. *Int. J. Psychoanal.*, 1962, 43(4-5), 194-205.—The patient-therapist relationship involved in the positive transference and in the transference neurosis is the main curative vehicle in psychoanalytical treatment; and its importance transcends that of development of insight by the patient.—G. Elias.

8065. Heller, Kenneth; Meyers, Roger A., & Kline, Linda Vikan. (U. North Dakota) Interviewer behavior as a function of standardized client roles. *J. consult. Psychol.*, 1963, 27(2), 117-122.—In a study of interviewer behavior as a function of client stimulus input, it was hypothesized that interviewers confronted with client friendliness would respond with likeable, agreeable behavior while interviewers confronted with client hostility would respond with subtle counter hostility and anxiety. Also, it was hypothesized that client dominance would evoke passive interviewer behavior and client dependence would evoke interviewer activity and hyperresponsibility. To control client input, 4 actors were trained as clients and were presented in counter balanced order to 34 therapists-in-training for ½ hour interviews. On the basis of observer ratings, all hypotheses, except for interviewer anxiety, were confirmed. (18 ref.)—*Journal abstract*.

8066. McNair, Douglas M., Lorr, Maurice, & Callahan, Daniel M. (Veterans Benefits Office, Washington, D. C.) Patient and therapist influences on quitting psychotherapy. *J. consult. Psychol.*, 27(1), 10-17.—Groups of 106 early therapy Terminators and 176 Remainers differed significantly on 10-patient characteristics. Best predictors of duration were a Terminator-Remainer test battery plus rated motivation for psychotherapy. Therapists with marked interest in the patients' problems held significantly higher proportions of both predicted Terminators and Remainers in treatment. 7 other therapist characteristics did not substantially influence termination rates. Hiler's contention that predicted Terminators and Remainers respond differently to the same therapist attributes was not supported, but it was found that some therapists react differently to the 2 types of patients. The results indicate that Terminators and Remainers form distinguishable outpatient

populations. The former reject psychotherapy, perhaps because they lack the behavioral repertoire required for participation. (16 ref.)—*Journal abstract*.

8067. Mintz, Elizabeth E. (National Psychological Ass. Psychoanalysis, N. Y.) Transference in co-therapy groups. *J. consult. Psychol.*, 1963, 27(1), 34-39.—Literature on co-therapy groups, led jointly by male and female therapists, is discussed. Their advantages, against groups led by 2 like-sexed therapists, include: (a) reproduction of the original family situation, (b) opportunity for patients of both sexes to identify with a like-sexed therapist, and (c) opportunity to work out anxieties with a therapist of the more-dreaded sex. Case histories describe a Don-Juan type of man whose adjustment improved after working through defenses against Odipal feelings in co-therapy, and an immature borderline woman who overcame panic reactions to both sexes when reassured by the simultaneous presence of 2 parent-figures. Special transference phenomena, research possibilities, and possible problems in co-therapy are discussed.—*Journal abstract*.

8068. Nacht, S. The curative factors in psychoanalysis. Part II. *Int. J. Psychoanal.*, 1962, 43(4-5), 206-211.—The importance of the therapist's personality and the reactions it elicits in the patient are emphasized as the most significant elements in psychoanalysis.—G. Elias.

8069. Sandler, J. Research in psychoanalysis: The Hampstead Index as an instrument of psychoanalytic research. *Int. J. Psychoanal.*, 1962, 43(4-5), 287-291.—A description of the construction of the Hampstead Index which classifies case materials into psychoanalytically meaningful categories for quick reference.—G. Elias.

8070. Segal, Hanna. The curative factors in psychoanalysis. Part III. *Int. J. Psychoanal.*, 1962, 43(4-5), 212-217.—Insight gained in therapy leads to therapeutic changes by enabling the patient to regain parts of his lost self, face his conflicts, and re-orient himself to reality's needs.—G. Elias.

8071. Seguin, C. A. Love and psychotherapy: The psychotherapeutic Eros. *Acta psychother. psychosom.*, Basel, 1962, 10(3), 173-192.—The therapist's feelings toward his patient are critical in the relationship. Love exists in many varieties and the analytic notion of counter transference, Moreno's "tele," the existentialist "encounter," Buber's "I and Thou unity," and von Weizsäcker's "Weggenossenschaft" are considered. For the "love" of the therapist for his patient, the author proposes the term "psychotherapeutic Eros."—G. Rubin-Rabson.

8072. Siegman, Aron Wolfe, & Pope, Benjamin. (U. Maryland School Medicine) An empirical scale for the measurement of therapist specificity in the initial psychiatric interview. *Psychol. Rep.*, 1962, 11(2), 515-520.—A description of a scale and details of its construction motivated by recent findings that "the specificity level of the therapist's statements is a significant source of variance in patient's verbal responses. . . . Data were also presented which indicate that the scale can be used by untrained raters with adequate reliability. Some evidence is presented to demonstrate that the empirical scale does not depart from the concept of specificity on which the a priori scale was based."—B. J. House.

8073. Stoler, Norton. (U. Wisconsin) **Client likability: A variable in the study of psychotherapy.** *J. consult. Psychol.*, 1963, 27(2), 175-178.—A study designed to investigate the rateableness of client likability (CL), and the relationship of CL to success in psychotherapy. 10 clients were rated as to their likableness by 10 raters from 2 recorded segments taken from the therapy of each of the clients. The clients were classified into more successful and less successful categories prior to this study. 2 levels of rater familiarity with the cases were employed. It was found that: (a) CL was rated reliably by the familiar raters beyond the .01 level; (b) the more successful clients were liked significantly greater than the less successful clients, beyond the .05 level; and (c) CL correlated significantly with the Experiencing Strand of Rogers' Process Scale. It was concluded that CL can be reliably rated and that success in therapy is possibly related to this variable.—*Journal abstract.*

8074. Strickland, Bonnie R., & Crowne, Douglas P. (Emory U.) **Need for approval and the premature termination of psychotherapy.** *J. consult. Psychol.*, 1963, 27(2), 95-101.—This study tested the hypotheses that approval-dependent individuals tend prematurely to terminate psychotherapy, and are rated by therapists as more defensive and less improved than patients less approval-dependent. 85 psychiatric outpatients completed the Marlowe and Crowne Social Desirability scale (the measure of need for approval) and rated their improvement in psychotherapy. Therapists rated 30 of these patients on defensiveness, attitude towards patient, patient's attitude towards therapist, improvement, and satisfaction with therapy. Additional measures included diagnosis, social class, and ordinal position. Results confirmed the hypotheses. The high need for approval group terminated significantly ($p < .005$) earlier. Approval-motivated patients were generally given more negative ratings by therapists. Approval-motivated females rated themselves as more improved. Ordinal position and social class failed to predict stay in therapy. The implications of these findings were discussed. (25 ref.)—*Journal abstract.*

Group Therapy

8075. Harley, A. B., Jr. (Medical Coll. Hosp., Charleston, S. C.) **Group psychotherapy for parents of disturbed children.** *Ment. Hosp.*, 1963, 14(1), 14-19.—2 groups meeting weekly for limited periods are described in detail. "Group psychotherapy for parents of emotionally disturbed children is not a new idea, but one whose value warrants continued reappraisal because it helps to clarify the psychodynamics of family interaction."—L. Gurel.

8076. Reed, Julian W. (Johns Hopkins School Medicine, Baltimore) **Group therapy with asthmatic patients.** *Geriatrics*, 1962, 17(12), 823-830.—Procedures and practices with severe chronic asthma patients are described. Indications for individual and group psychotherapy are given. It is suggested that decrease in morbidity will ensue if this approach is more widely used.—D. T. Herman.

8077. Salzberg, H. C. (VA Hosp., Augusta, Ga.) **Effects of silence and redirection on verbal responses in group psychotherapy.** *Psychol. Rep.*, 1962, 11(2), 455-461.—"It was found that both

[silence and redirection] significantly influenced the interaction and the quality of response of" a group of psychiatric inpatients undergoing group psychotherapy ($N = 19$). "The magnitude of the effects indicated that verbal behavior, at least as measured grossly, follows lawful principles. It is hoped that this report will help to interest other investigators in refining measuring techniques and in studying the process of group psychotherapy with the goal of making it a more efficient technique."—B. J. House.

Special Therapies

8078. Fine, R., Daly, D., & Fine, L. (St. Louis State Hosp., Mo.) **Psychodance: An experiment in psychotherapy and training.** *Group Psychother.*, 1962, 15(3), 203-223.—Psychodance is a form of psychotherapy felt to be effective with groups of both nonverbal and verbal patients. These movements emphasize both self-expressive and interpersonal contact operations." The authors present a theoretical background and offer several examples of this technique. (18 ref.)—I. W. Kidorf.

8079. Moreno, J. L. (Moreno Inst., Beacon, N. Y.) **The "united role theory" and the drama.** *Group Psychother.*, 1962, 15(3), 253-254.—The inspiration of modern role theory comes from the drama and the theater. There are 3 dimensions of role development: the psychosomatic, psychodramatic, and the social. "It is of heuristic value for the clinician . . . to differentiate social from psychodramatic and psychosomatic roles . . . the final justification will come from . . . experiments further broadening and validating this hypothesis."—I. W. Kidorf.

8080. Murray, Neville, & Murray, Betty. (The Murray Clinic, San Antonio, Tex.) **Recognition and management of group self destruction in psychodrama.** *Group Psychother.*, 1962, 15(3), 200-202.—"Self destruction is a naturally occurring biological phenomenon. In terms of group activity such processes must . . . be recognized . . . the inability of the group to deal with the hostile and aggressive drives being turned inward, with a consequent disintegration of the group itself, is usually targeted toward the group leader . . . but may manifest itself in covert fashion."—I. W. Kidorf.

8081. Nichols, Florence L. (Toronto, Canada) **Psychiatrist and nurse as co-therapists in a psychodrama group.** *Group Psychother.*, 1962, 15(3), 197-199.—A psychiatrist and a nurse conducted a psychodrama group of 18 patients: 8 married couples and 2 others. At times the psychiatrist directed and the nurse was available for playing auxiliary roles; at other times the nurse directed. Results were felt to be good insofar as therapeutic progress was concerned.—I. W. Kidorf.

8082. Städeli, Hermann. (Wildhaus Switzerland) **Spieltherapie und Persönlichkeitsentwicklung.** [Play therapy and development of personality.] *Prax. Kinderpsychol. Kinderpsychiat.*, 1962, 11(7), 251-255.—How the child experiences play and how he is helped by the therapist are interpreted and illustrated with parallels in the magic, animistic, religious phases of mankind, and with Friedrich Schiller's distinction between the 2 play instincts: the instinct in the sense organs for matter and in reason for form. Freud's phases of child development are seen in the light of those parallels.—E. Katz.

8083. Stokvis-Warnaar, J., & Stokvis, B. (Leyden State U., Netherlands) **Psychodrama of enuresis nocturna in boys.** *Group Psychother.*, 1962, 15(3), 179-196.—A description of the treatment of 4 enuretic children, aged 12-15. 2 psychodrama sessions are discussed.—I. W. Kidorf.

HYPNOSIS

8084. Abrams, S. (Camarillo State Hosp., Calif.) **Short-term hypnotherapy of a schizophrenic patient.** *Amer. J. clin. Hypn.*, 1963, 5(4), 237-247.—The treatment of a case of schizophrenia on hypnotic levels is reported with emphasis upon selective elements involved.—M. V. Kline.

8085. Bentler, P. M., & Hilgard, Ernest R. (Stanford U.) **A comparison of group and individual induction of hypnosis with self-scoring and observer-scoring.** *Int. J. clin. exp. Hypn.*, 1963, 11(1), 49-54.—45 volunteer Ss were hypnotized in small groups and were subsequently hypnotized in individual sessions. In both sessions observer- and self-scores were recorded for all suggestions of the Harvard Group Scale adaptation of the Stanford Hypnotic Susceptibility Scale. The correlation between observer- and self-scores indicated that hypnotic susceptibility in the 2 sessions was very similar. Group self-scores were also found to predict quite accurately objective hypnotist scores of the subsequent individual session. A 2nd sample of 34 nonvolunteer male Ss were hypnotized individually following Form A of the Stanford scale. Self-scoring was found to be remarkably similar to observer ratings, and the results of group administration very comparable to those of individual administration of hypnotic susceptibility tests.—C. S. Moss.

8086. Das, J. P. (Utkal U.) **Yoga and hypnosis.** *Int. J. clin. exp. Hypn.*, 1963, 11(1), 31-37.—The nature of Yoga and Samadhi (concentration) was described. A comparison with hypnosis revealed widely differing objectives, but many points of functional and methodological similarity.—C. S. Moss.

8087. Deckert, G. H., & West, L. J. (U. Oklahoma) **Amer. J. clin. Hypn., 1963, 5(4), 256-276.—This paper reviews the literature of hypnosis and experimental psychopathology. Approximately 175 papers under the categories of hypnosis and induced alterations of perception, emotion, and behavior are summarized.—M. V. Kline.**

8088. Dorcus, R. M. (U. California, Los Angeles) **Fallacies in predications of susceptibility to hypnosis based upon personality characteristics.** *Amer. J. clin. Hypn.*, 1963, 5(3), 163-170.—The reasons for resistance to the induction of hypnosis are examined in relation to the problem of susceptibility.—M. V. Kline.

8089. Gindes, Bernard C. **Delusional production under hypnosis.** *Int. J. clin. exp. Hypn.*, 1963, 11(1), 1-10.—Hypnosis creates a situation for the development of fantasies which carry over into waking life as delusions. The patient, susceptible to common impressions of hypnosis, may use the opportunity to indulge ordinarily inhibited impulses. The therapist should be alert to the jeopardy of his involvement in such delusions.—C. S. Moss.

8090. Hilgard, Ernest R. (Stanford U.) **Ability to resist suggestions within the hypnotic state:**

Responsiveness to conflicting communications. *Psychol. Rep.*, 1963, 12(1), 3-13.—"Of 12 moderately susceptible Ss instructed to resist under hypnosis selected items passed in earlier sessions, 1 was unable to resist at all, 5 were able to resist on one but not both of the attempted items, and 6 were able to resist both. . . . For most Ss the hypnotist's suggestions remained effective, but they were countered by extreme exertion. The situation is interpreted as one of resolving conflict between conflicting communications, the resolution depending upon the relative strengths of the parties to the conflict. It is pointed out that the communications between the hypnotist and S are very complex, in this instance involving at least four kinds of communication: instructions, suggestions, challenges, and invitations to resist."—B. J. House.

8091. Hilgard, Ernest R., & Bentler, P. M. (Stanford U.) **Predicting hypnotizability from the Maudsley Personality Inventory.** *Brit. J. Psychol.*, 1963, 54(1), 63-69.—In an attempt to repeat the findings of Furneaux and Gibson, 142 undergraduate students at Stanford were hypnotized by the procedures of the Stanford Hypnotic Susceptibility Scale and a group adaptation of this scale. All Ss were also given the Maudsley Personality Inventory (MPI), including the Extraversion, Neuroticism, and Lie scales. When the Ss were subdivided into personality classifications according to the procedures of the Furneaux and Gibson study, significant differences between subgroups were found, but these were opposite to the significant differences found in the London study, "liars" being below average in hypnotizability in England, and above in America, and, among the "honest" Ss, Stable Extroverts and Neurotic Introverts being more hypnotizable than Neurotic Extraverts and Stable Introverts in England, less hypnotizable in America. Because of instability in successive samples in America, and some differences between English subsamples, it is suggested that elaborate hypotheses are not in order until there has been further replication both in England and America. Correlations between scores on individual MPI scales and hypnotic susceptibility show a most unsatisfactory variation from sample to sample; hence the most acceptable conclusion must be that the MPI cannot yet be used as a predictor of susceptibility to hypnosis.—*Journal abstract.*

8092. Hubbard, O. E. (U. Mississippi Medical Cent.) **Hypnotherapy of a patient complaining of a speech defect (following Lindner's method of hypnoanalysis).** *Amer. J. clin. Hypn.*, 1963, 5(4), 281-294.—A case report of hypnoanalysis in a case of speech disorder, with emphasis upon directive hypnotic techniques.—M. V. Kline.

8093. Kaim, B. T. (Apt. Aereo 1782, Cali, Colombia) **Some dangerous techniques of hypnotic induction.** *Amer. J. clin. Hypn.*, 1963, 5(3), 171-176.—The author reviews and comments on the dangers inherent in different kinds of hypnotic techniques.—M. V. Kline.

8094. Klemperer, E. (315 E. 77th St., NYC) **Symptom removal by revivification.** *Amer. J. clin. Hypn.*, 1963, 5(4), 277-280.—Hypnoanalysis and symptom removal are discussed in the context of total psychotherapy.—M. V. Kline.

8095. Krippner, S. (Kent State U.) **Hypnosis and reading improvement among university students.** *Amer. J. clin. Hypn.*, 1963, 5(3), 187-193.—The role of hypnosis in the treatment of educational problems in the academic setting with emphasis upon reading is evaluated.—M. V. Kline.

8096. Levitt, Eugene E. (Indiana U. Medical Cent.) **A comment on "a paradigm for determining the clinical relevance of hypnotically induced psychopathology."** *Psychol. Bull.*, 1963, 60(3), 326-329.—A critique of the paper by Reyher in which he sets forth a model for experiments in the hypnotic induction of emotional states, and attacks all earlier research which fails to conform to this model. It is pointed out that Reyher's approach assumes that various psychoanalytic hypotheses of the origins of emotional states are empirically verified. He supposes erroneously that hypnotically suggesting a state directly always specifies the behavior which should follow from that state. He assumes, without empirical evidence, that suggesting a state in a "pure" form renders consequent experimental results inapplicable to clinical practice. Reyher's rejection of the earlier work, as well as much of his claim for his model, is found to be without adequate basis.—*Journal abstract.*

8097. Levitt, Eugene E., & Hershman, Seymour. (Indiana U. Medical Cent.) **The clinical practice of hypnosis in the United States: A preliminary survey.** *Int. J. clin. exp. Hypn.*, 1963, 11(1), 55-65.—A questionnaire survey of 301 clinical practitioners of hypnosis suggests that success in induction is unrelated to experience. Children and adolescents are claimed to be more susceptible than adults, but no sex differences were reported. Type of training is generally unrelated to reported success. Percentages of patients who attain various levels of hypnotic depth are generally consistent with earlier reports. Unexpected reactions to hypnosis were reported by 1/4 of respondents. Large variances indicate many exceptions to any generalizations.—C. S. Moss.

8098. Pulver, Sydney E. (Pennsylvania Hosp.) **Delusions following hypnosis.** *Int. J. clin. exp. Hypn.*, 1963, 11(1), 11-22.—Delusions occurring after hypnosis in the nonpsychotic patient are usually a result of the interplay of 3 factors. (a) the development of rapid, tense, transference reactions in hypnosis; (b) the presence of major defects in the patient's character structure; and (c) the occurrence of countertransference reactions on the part of the hypnotist which touch on a specific area of conflict within the patient. The presence of a chaperon or the use of tape recorders are not satisfactory preventive measures. Rather, the physician using hypnosis should focus upon: (a) preliminary psychological evaluation and selection of patients free from disposition to delusion formation, (b) identification of transference reactions and a willingness to discuss with patients, (c) awareness of his own emotional responses to the patient. Basic courses in psychiatry are recommended.—C. S. Moss.

8099. Reyher, Joseph. (Michigan State U.) **A reply to Levitt's comments.** *Psychol. Bull.*, 1963, 60(3), 330-332.—Levitt's critique (see 37: 8096) indicates that he missed the main point of the paradigm, and that he misinterpreted a variety of other matters. An effort is made to clarify the issues involved by citing sections of the original article and

by further discussion when necessary. Particular emphasis is placed upon the paradigm as a method for testing theories of psychopathology which assume genotypic-phenotypic relationships. The need for proper control groups is reiterated, and the paradigm is viewed as an attempt to bring the data of clinical and experimental methods closer into congruence.—*Journal abstract.*

8100. Richardson, T. A. (200 Dennis St., Minden, La.) **Hypnotherapy in frigidity.** *Amer. J. clin. Hypn.*, 1963, 5(3), 194-199.—Hypnotherapy was employed to treat frigidity in a total of 76 patients. Results are given and analyzed. The overall pretreatment percentage of climaxes was approximately 24%, the overall post-treatment average was about 84%.—M. V. Kline.

8101. Schulman, Robert E., & London, Perry. (U. Illinois) **Hypnotic susceptibility and MMPI profiles.** *J. consult. Psychol.*, 1963, 27(2), 157-160.—4 groups totaling 87 undergraduate females of relatively different hypnotic susceptibility as determined by Form A of the Stanford Scale of Hypnotic Susceptibility completed the questionnaire form of the MMPI. The most susceptible group scored significantly lower than the others on the Pd scale ($p < .01$), but no other significant differences were found between groups. Mean scores of all susceptibility groups fell within the normal range, suggesting that hypnotic susceptibility is not grossly related to psychopathology. (18 ref.)—*Journal abstract.*

8102. Shor, Ronald E., & Orne, Emily Carota. (Harvard Medical School) **Norms of the Harvard Group Scale of Hypnotic Susceptibility, form A.** *Int. J. clin. exp. Hypn.*, 1963, 11(1), 39-47.—Norms are presented on an adaptation for group administration with self-report scoring of Weitzenhoffer and Hilgard's Stanford Hypnotic Susceptibility Scale, Form A. Comparisons are made between a sample of 132 undergraduates given the new group-administered version and 4 reference samples including the original Stanford University normative group. Findings indicate that the group-administered version yields norms congruent with the individually-administered original. Diagnostic evaluations of hypnotic depth after one or more additional hypnotic training sessions tentatively indicate that the adapted scale is an effective predictor of subsequent hypnotic depth.—*Author abstract.*

8103. Slater, R. C., & Flores, L. S. (Special Medical Clinic, Blythe, Calif.) **Hypnosis in organic symptom removal: A temporary removal of an organic paralysis by hypnosis.** *Amer. J. clin. Hypn.*, 1963, 5(4), 248-255.—A detailed case study on the use of hypnosis with beneficial results in an instance of eventually proved brain disease.—M. V. Kline.

8104. Weitzenhoffer, A. M. (U. Oklahoma Medical Center) **The nature of hypnosis. Part I.** *Amer. J. clin. Hypn.*, 1963, 5(4), 295-321.—Part I of a conceptual outline of the nature of hypnosis.—M. V. Kline.

DREAMS

8105. Baldridge, B. J., Whitman, R. M., & Kramer, M. (U. Cincinnati Coll. Medicine) **A simplified method for detecting eye movements during dreaming.** *Psychosom. Med.*, 1963, 25(1),

78-82.—A simple, sensitive, portable, inexpensive ceramic strain gauge is described.—*W. G. Shipman.*

8106. Freud, Sigmund. *On dreams.* New York: Norton, 1963. 120 p. \$.95 (paper).—A paper edition of the book originally published in 1952.

8107. Hall, Calvin, & Domhoff, Bill. (Inst. Dream Research) *A ubiquitous sex difference in dreams.* *J. abnorm. soc. Psychol.*, 1963, 66(3), 278-280.—Dream narratives from 1399 men and from 1418 women indicate that men dream more about other men than they do about women, whereas women dream about men and women in almost equal proportions. This finding is explained in terms of (a) a conflict theory of dreaming and (b) Freud's theory of the male and female Oedipus complex.—*Journal abstract.*

8108. Roth, N. Reply to Dr. Erika Fromm. *Percept. mot. Skills*, 1962, 15(2), 282.—Roth replies to an article by Fromm (see 37: 5251) criticizing his earlier article.—*W. H. Guertin.*

CASE HISTORIES

8109. Menninger, Karl A., Mayman, Martin, & Pruyser, Paul W. (Menninger Clinic) *A manual for psychiatric case study.* (2nd ed.) New York: Grune & Stratton, 1962. xi, 189 p. \$.55.—A guide for the practicing psychiatrist in the collection, organization, and interpretation of the data of a psychiatric case study.—*C. H. Milley.*

PSYCHIATRIC SERVICES

8110. Smith, Ora R. (Pennsylvania Psychiatric Inst., Phila.) *Criteria for the differential use of treatment settings for children and emotional disorders.* New York: Child Welfare League America, 1962. iii, 28 p. \$.90.—The intake criteria of 4 different treatment centers—a closed (state) hospital, a voluntary psychiatric children's hospital, an open-type residential center, and a day-treatment center—are discussed in some detail by representatives of each in this monograph made up of papers presented at an Eastern Regional Conference of the Child Welfare League of America (April 1961). Despite wide differences in the criteria for admission, there is general agreement as to the deficiencies in most admission procedures, chiefly in terms of inadequate understanding by referring agencies of the services offered, undue rigidity, concern with irrelevant variables, and lack of validity for selection criteria currently in use.—*L. D. Summers, Jr.*

Institutional Care

8111. Britton, Joseph H., & Britton, Jean O. (Pennsylvania State U.) *Expectations for older persons in a rural community.* *Geriatrics*, 1962, 17(9), 602-608.—Interviews were held with one adult of 90% (N = 487) of the households with regard to suggested solutions for anecdotally posed problems of the elderly. Professional and institutional care tended to be suggested more frequently than family care of informal assistance, but actual services of professional persons were not in great demand by the elderly.—*D. T. Herman.*

8112. Butterfield, Earl C., & Warren, Sue A. (Southbury Training School, Conn.) *Prediction of attendant tenure.* *J. appl. Psychol.*, 1963, 47(2),

101-103.—MMPI L, K, Pd, and Ma subscales were administered to 109 persons who were subsequently hired for the position of cottage attendant in an institution for the mentally retarded. 3 subscales and a composite score from all 4 of them distinguished significantly between attendants who were fired during the first 6 months of employment and attendants who were retained in employment and did not receive unfavorable evaluations from their immediate supervisors.—*Journal abstract.*

8113. Group for the Advancement of Psychiatry, Committee on psychiatric Nursing. *Toward therapeutic care: A guide for those who work with the mentally ill.* *GAP Rep.*, 1961, No. 51. vi, 104 p.—Therapeutic effectiveness in helping psychiatric patients depends upon understanding the patient's behavior and upon responding adequately to the behavior. Part I is a revision of "Therapeutic Use of the Self" (see 31: 9065). "It is important for . . . personnel to understand and to be aware of the feelings, thoughts, and actions of the patients. They should have a similar understanding of their own thoughts and actions in any situation." Part II has 22 presentations of patient-personnel and intrastaff interactions. These cases may help personnel acquire better self-appraisal and reexamine the relevancies of responses to the patient. (76 ref.)—*E. deT. Kooser.*

8114. Müller-Küppers, M. (Heidelberg, Germany) *Zur beruflichen Stellung des Kinderpsychiaters und seiner Mitarbeiter unter besonderer Berücksichtigung der stationären Kinderpsychiatrie.* [On the Professional position of the child psychiatrist and his co-workers with special consideration of child psychiatry in institutions.] *Prax. Kinderpsychol. Kinderpsychiat.*, 1962, 11(7), 247-251.—The problems (a) how to win young physicians for this field and (b) the team work of the psychiatrist with representatives of the other professions on the staff are analysed. Jobs and functions of psychologists, "psychagogues," nurses, group workers, educators, etc., are described.—*E. Katz.*

8115. van Krevelen, D. Arn. *Zur Problematik der therapeutischen Kuppelung bei neurotischen Jugendlichen.* [The problem of therapeutic grouping in neurotic adolescents.] *Acta psychother. psychosom.*, Basel, 1962, 10(3), 233-245.—Spontaneous "pathological" pairing may gain therapeutic importance, thereby complicating the whole process. To utilize the natural attraction among patients, it is suggested that the eldest patients be cared for by the youngest nurses.—*G. Rubin-Rabson.*

Community Services

8116. Dibner, Andrew S., Palmer, Robert D., Cohen, Benjamin, & Gofstein, Arnold G. (VA Mental Hygiene Clinic, Boston, Mass.) *The use of an open-ended group in the intake procedure of a mental hygiene unit.* *J. consult. Psychol.*, 1963, 27(1), 83-88.—Several clinics have found screening in small groups on intake to be beneficial in reducing waiting lists and evaluating patients for treatment. Others have used small short-term groups to orient and educate patients to treatment. We have run a continuous, open-ended intake group for these purposes and to provide nuclei for other closed therapy groups. The result has been elimination of the waiting list and demonstrated improvement in patient

preparation for psychotherapy. During a period of 18 months, the 61 patients referred to the open-ended group stayed significantly longer in treatment than a control group. A replication using another therapist yielded a similar result.—*Journal abstract.*

8117. Riese, Hertha. (Educational Therapy Cent., Richmond, Va.) *Heal the hurt child.* Chicago, Ill.: Univer. Chicago Press, 1962. xxiii, 615 p. \$10.00.—A combined psychotherapeutic and educational approach is emphasized, based upon 20 years experience at a center for the treatment of extremely deprived Negro children elsewhere diagnosed as "untreatable." The case for a total care program—encompassing social support, education, therapy, and prevention—is extensively documented. Dynamic case histories, notes, and chapter-by-chapter lists of collateral readings are appended.—*C. M. Franks.*

8118. Sini, S. Sull 'organizzazione dei servizi sociali di igiene mentale. [The organization of social services of mental hygiene.] *Difesa soc.*, 1963, 41(3), 115-143.—Mental hygiene encompasses other specialities besides medicine (psychiatry, sociology, pedagogy, psychology, criminology, politics, etc.). On the basis of this assumption, an organizational chart of social services to encompass the total human being from conception to old age is presented and discussed.—*L. L'Abate.*

Case Work

COUNSELING & GUIDANCE

8119. Cantoni, Louis J., & Cantoni, Lucile. (Wayne State U.) *The case for counseling by friends.* *Blind American*, 1962, 2(4), 8-14.—Presenting a rationale for counseling by lay persons, the authors define the therapeutic role of interested, perceptive friends who are sought out by the troubled. Friends as counselors do not replace psychologists, psychiatrists, or social workers. There is an appropriate and natural continuity in the functions of helping friends and of professionals. Occasions and techniques for referral of disturbed friends or relatives by laymen to professionals are discussed. Members of the various helping professions should educate interested lay persons in therapeutic understandings and techniques. A community better informed regarding its counseling responsibility will not use less professional counseling but more and will use it more effectively.—*Author abstract.*

8120. Filter, Raymond O. *One road to heaven.* New York: Pageant, 1962. 82 p. \$3.00.—A counselor's reflections on conflict and adjustment in non-academic terms.—*F. T. Severin.*

8121. Wells, Cecilia G. (Detroit, Mich.) *Psychodrama and creative counseling in the elementary school.* *Group Psychother.*, 1962, 15(3), 244-252.—Several illustrations of role playing techniques in an elementary school are given. Limitations made it necessary to vary traditional procedures and "props" of sociodrama and psychodrama. Such limitations stimulated more creative effort on the part of the counselor.—*I. W. Kidorf.*

MARRIAGE & FAMILY PROBLEMS

8122. Davids, A., & Rosengren, W. R. (Brown U.) *Social stability and psychological adjustment during pregnancy.* *Psychosom. Med.*, 1962, 24(6),

579-583.—"Thirty pregnant women, referred by obstetricians in private practice, were seen for a sociological interview and were administered a battery of psychological assessment procedures. Women who were dissatisfied with their social status and were otherwise socially unstable were found to be generally less happy, less happy to be pregnant, more anxious, higher on the personality syndrome of alienation, and more emotionally maladjusted."—*W. G. Shipman.*

8123. Dyer, William G. (Brigham Young U.) *Analyzing marital adjustment using role theory.* *Marriage fam. Liv.*, 1962, 24(4), 371-375.—Using role analysis as the basic framework, the major factors in marital adjustment are (a) normative orientations, (b) position-role, (c) role expectations and (d) sanctions. Points of conflict and possible methods of adjustment are considered in the light of these factors. In some cases altering the situation that may be fostering certain role behaviors or expectations may make for a reduction in conflict without the necessity for the partners having to make some alteration of their norms, roles or role expectations.—*H. D. Arbitman.*

8124. Shipman, Gordon. (U. Wisconsin) *The use of autobiographies in marriage education.* *Marriage fam. Liv.*, 1962, 24(4), 393-398.—Autobiographical material may be used beneficially in a marriage course to ventilate the student's emotional problems and to enhance his personality development. Important cautions to be observed are: (a) the autobiography writing should not be mandatory, (b) it should be confidential, (c) the instructor should make marginal notes on the paper, (d) students should consult with the instructor on any problems arising as a result of the assignment, (e) class work should be related to the assignment, (f) an outline of possible topics to cover should be provided for the student, and (g) the instructor should permit either an oral or written report, or a combination of the 2.—*H. D. Arbitman.*

8125. Tharp, Roland G. (U. Arizona) *Psychological patterning in marriage.* *Psychol. Bull.*, 1963, 60(2), 97-117.—Theory and research are reviewed and integrated with sociological data on mate selection and marital happiness. Topics included are homogeneity, interpersonal perception, identifications, complementary needs, and role theory. Modal marriage-role expectations exist; they are different for the sexes, and are established by parental identifications. The husband role is more instrumental; the wife role more integrative. For the marital happiness of both spouses, the husband's role performance is more crucial than that of the wife. For all marriages—both modal and unique—happiness is a function of the satisfaction of those needs and expectations which, for each individual, are specific to marriage. Thus, investigation of role-specific need dispositions is preferable to conventional approaches which deal with general personality needs. (82 ref.)—*Journal abstract.*

MENTAL HEALTH & REHABILITATION

8126. Manis, J. G., Brawer, M. J., Hunt, C. L., & Kercher, L. C. (Western Michigan U.) *Validating a mental health scale.* *Amer. sociol. Rev.*, 1963, 28(1), 108-116.—An attempt was made to validate the 22-item mental health scale used in the New York Midtown study (see 37: 1565) by both the "known groups" and "independent criteria" procedures. Sam-

ples were drawn from a state mental hospital, a large state university, a small community in a nearby county, and from residents from the same county as the hospital and university. The scale appears to be more valid for group than individual differences. The authors conclude that "The mental health scales, less accurate in individual diagnosis, permit survey studies of random samples of communities, social classes, ethnic groups and other social units."—*L. Berkowitz*.

8127. Palmer, C. E. (Northwestern State Coll.) **The role of religion in rehabilitation. Part I.** *Rehabilit. Lit.*, 1962, 23(12), 362-370.—Rehabilitation was defined and considered in terms of religious beliefs, the differences in depth of conviction, and the nature of the religious beliefs of individuals. The role of religion as a motivating factor for the providing of rehabilitation services was discussed, and a question was raised concerning a relationship between the religious experience of a person and his effectiveness as a therapist. (139 ref.)—*W. D.*

ABNORMAL PSYCHOLOGY

8128. Bauer, Julius. (Loma Linda U. Coll. Medicine, Los Angeles) **Mental illness, mental retardation, mental hygiene in modern culture.** *Acta genet. med. gemellolog.*, Rome, 1963, 12(1), 9-21.—The deterioration of mental health of our population is usually interpreted as the result of the increased modern life stress in our atomic age with its implications of the "cold war." It is not a greater cultural life stress, however, but rather a lower individual resistance to it that accounts for the increased frequency of psychoneuroses in modern society. The term "mental retardation" comprises 2 categories: 1 is caused by genetic factors or acquired intra- and extrauterine diseases of infancy and childhood; the 2nd is due to functional mental retardation if the normal individual genetic endowment has not developed to its full capacity and has persisted in a state of immaturity without any interference of a disease. The characteristics of such functional mental retardation (psychic infantilism) and their manifestation in society are outlined in detail. Instincts and emotions insufficiently inhibited by intellect determine the behavior of the functionally mentally retarded. Deficient ethics and responsibility are very often consequences of deficient intellect. Conformism is a subterfuge and evasion from personal responsibility. Exuberant imagination and fantasy of an immature mind, uncontrolled by intellect, becoming prevalent in a schizoid personality have eliminated the concept of beauty—and this is the essence of aesthetics—from creative art, music, and literature. Mental hygiene is chiefly the job of the family home and the teachers in primary and secondary schools. Education is more than drill and training. Teachers cannot be replaced by machines. Automation techniques, recently used even for personality assessment, are out of place in this field.—*Journal abstract*.

8129. Carp, E. A. D. E. **Der Griff im psychologisch-verstehenden Weltbild: Der neurasthenische, der melancholische, der manische Mensch.** [The concept of the psychologically understood world in terms of the neurasthenic, the melancholic, and the manic individual.] *Acta psychother. psychosom.*,

Basel, 1962, 10(3), 191-205.—Jaspers postulates an approach to the world as psychologically comprehending. Various psychopathological conditions can be interpreted as a fixation in this kind of world.—*G. Rubin-Rabson*.

8130. Wilson, Ronald S. (U. Iowa) **On behavior pathology.** *Psychol. Bull.*, 1963, 60(2), 130-146.—A selective review of the literature suggests that the same major features of behavior pathology appear in both the clinical studies of human disorders and experimentally produced behavior disorders in animals. In the clinical area the 3 major features are: presence of an intense anxiety reaction, development of stereotyped and repetitive symptoms, and fixation of needs and emotions at an immature level. Studies of experimental neurosis reveal that acute anxiety and formation of stereotyped, repetitive symptoms are characteristic of this area as well, and related studies point to fixation as a consequence of infantile frustration. It would appear that the same principles control behavior pathology in several species and are applicable in a wide range of situations. (26 ref.)—*Journal abstract*.

8131. Wyrsh, Jakob. **Don Juan und die psychopathologie.** [Don Juan and psychopathology.] *Confin. psychiat.*, Basel, 1962, 5(2-3), 61-95.—How is it that we experience the frivolous and cynical Don Juan's end as tragic? But we usually overlook Don Juan's defiance of his visitor from the dead, his hybris in the intoxication of his sensual self-assertion which leads, of necessity, to his tragic downfall. Poets and psychopathologists will continue to vie for the last word about the secret of his fascination.—*E. W. Eng.*

PHYSICAL HANDICAPS

Blineness

Deafness

8132. Birch, J. R., Stuckless, E. R., & Birch, J. W. (Western Pennsylvania School Deaf) **An eleven-year study of predicting school achievement in young deaf children.** *Amer. Ann. Deaf.*, 1963, 108(2), 236-240.—Leiter International Performance Scale (LIPS) intelligence quotients, teachers' evaluations of learning potentials, teachers' estimates of educational achievement, and Stanford Achievement Test (SAT) measures were intercorrelated on 25 Ss (15 boys, 10 girls). LIPS correlated .43 to .63 with achievement measures; teachers' estimates of learning potential correlated .53 to .71 with SAT measures. All intercorrelations are presented; and the results, implications, and suggestions for further research are discussed.—*T. E. Newland*.

8133. Debot-Sevrin, M. R. **Étude des conséquences possible de la surdi-mutité.** [Study of possible consequences of deafness.] *Bull. Psychol. scol. Orient.*, 1962, 11, 13-23.—An experimental study of 40 deaf-and-dumb children by means of drawings and personality tests. The author concludes that re-education must begin as early as possible, in order to avoid dangerous consequences of deafness.—*R. Piret*.

SPEECH DEFECTS

8134. Mahrer, Alvin R., & Young, Harl H. (Denver VA Hosp.) **The onset of stuttering.** *J. gen. Psychol.*, 1962, 67(2), 241-250.—Stuttering is

to be understood and described as goal-directed behavior. 2 sets of psychological conditions which result in stuttering are proposed: (a) stuttering is a behavior which moves in the direction of meaningful psychological goals which serve in turn as a pathway toward subsequent goals; (b) stuttering is a behavioral expression of the relationship among meaningful goals, a behavior which moves in the direction of preserving or enhancing a given state of integration among the goals. Clinical and experimental hypotheses were offered in the form of conditions which culminate in the onset of stuttering. The conditions for the onset of both types of stuttering constitute a rationale for a research program on the onset of stuttering.—*Author abstract.*

NEUROLOGICAL DISORDERS

8135. **Boydston, Eleanor H. (Ed.)** Implications for maternal and child health and crippled children's programs. Berkeley, Calif.: Univer. California Press, 1961. 151 p.—Proceedings of the Regional Institute on Neurologically Handicapping Conditions in Children. 23 papers are presented, including several papers on the diagnosis and care of epilepsy and mild brain damage in children.—*E. L. Borrowman.*

8136. **Drillien, C. M.** (U. Edinburgh, Scotland) Obstetric hazard, mental retardation and behavior disturbance in primary school. *Developm. Med. child Neurol.*, 1963, 5(1), 3-13.—Objective data on 461 children, followed from birth to age 7, seen in the home by the same investigator at least 7 times during the first 5 yr., provided the basis "for thinking that obstetrical hazard is not a major factor in the causation of gross defect. An excess of behavior disturbance observed in school was significantly associated with low birth weight, pregnancy and delivery complications and postnatal familial distress. It is suggested that these obstetrical hazards may lower the child's resistance to adverse factors in the post-natal environment." The possible contributive role of mishandling of the handicapped child by parents and society is explored.—*T. E. Newland.*

8137. **Jabbour, J. T., & Lundervold, A.** Hemiplegia: A clinical and electroencephalographic study in childhood. *Developm. Med. child Neurol.*, 1963, 5(1), 24-31.—57 children were studied for an average of 4.5 yr. Assessed on IQ, speech, and behavior, mental ability was related to age, type of onset, cause, number of insults suffered, and to the association of the hemiplegia with seizures. A poorer prognosis was found in hemiplegia of gradual onset before 4 yr. of age and associated with seizures, trauma, or multiple insults. Epilepsy was found in only 23 patients on follow-up. Poor control of fits was associated with lower IQ, speech, and behavior levels than those of the seizure-free patients. Lesions were correctly localized by EEG in 98% of the cases. Abnormal EEG tracings and the prognosis in terms of IQ, speech, and behavior were inversely related.—*T. E. Newland.*

8138. **Macoun, Stephen.** Migraine in school children. *Developm. Med. child Neurol.*, 1963, 5(1), 62-63.—This is a note on Bo Bille's monograph on the subject. Studying 99.3% of the children, aged 7-15 yr., in Upsala in 1955, it was found that 4%

of the children had had migraine, that (in some) there was a gradual increase in attacks, though in 35%-50% of the cases it had disappeared after 6 yr. Associated psychological and physical conditions and caution in diagnosis are discussed.—*T. E. Newland.*

8139. **Wood, Grace E.** (North Bristol, England) Some observations on 141 cases of infantile hemiplegia. *Cerebral Palsy Rev.*, 1963, 24(1), 11-16.—Data reported on the cases seen in the Bristol area include incidence (approximately $\frac{1}{3}$ of the total cerebral palsied), birth information, possible etiological factors (a "multifactorial cause"), parental, and socioeconomic information. Included also are data on age of first discovery of the condition (70% after 6 mo.), age of walking (by age of 4, except in cases of severe mental defect), age of talking (45% by age of 12-18 mo.), age of onset of seizures (39 of the 61 were from birth), and type of education provided (68 in the regular school, 27 in special educational facilities). Treatment and employment are discussed.—*T. E. Newland.*

Brain Damage

8140. **Cole, Malvin, & Zangwill, O. L.** (National Hosp., London, England) Déjà vu in temporal lobe epilepsy. *J. Neurol. Neurosurg. Psychiat.*, 1963, 26(1), 37-38.—"The incidence of déjà vu in 27 cases of temporal lobe epilepsy has been ascertained, with special reference to the laterality of the focus, the handedness of the patient, and the presence or absence of dysphasia. A slight predominance of minor hemisphere foci (significant at the 5% level) has been established. None the less, it is considered inadvisable on present evidence to accept déjà vu as a lateralizing sign of temporal lobe dysfunction. 10 out of 13 patients with déjà vu were found to have tumors of the temporal lobe."—*M. L. Simmel.*

8141. **Costa, Louis D., Vaughan, Herbert G., Jr., Levita, Eric, & Farber, Norman.** (Albert Einstein Coll. Medicine) Purdue Pegboard as a predictor of the presence and laterality of cerebral lesions. *J. consult. Psychol.*, 1963, 27(2), 133-137.—A portion of the Purdue Pegboard Test taking 3 minutes to administer was given to 80 patients on a neurology service of a general hospital. With optimum cutoff scores it was possible to indicate the presence of laterality or diffuseness of brain damage in 70% of the cases. Brain damage without regard to lateralization was correctly determined in 90% of cases with 7.5% false negatives and 2.5% false positive. The test was then cross-validated on 65 consecutive admissions with small loss in predictive efficiency. The data support the use of sensorimotor rather than perceptual cognitive tests in screening for brain damage because they are less dependent upon educational background and because of the lateralizing significance of sensorimotor dysfunction.—*Journal abstract.*

8142. **Fitzhugh, K. B., Fitzhugh, L. C., & Reitan, R. M.** (New Castle State Hospital, Ind.) Relation of acuteness of organic brain dysfunction to trial making test performances. *Percept. mot. Skills*, 1962, 15(2), 399-403.—The control group was differentiated from the brain-damaged groups on each part of the Trials Test. Among the brain-damaged groups, those with static lesions generally performed at levels superior to those of the acute lesion group. Relationships between Trails scores and Wechsler test

scores for the different groups were discussed. The condition of brain lesions at the time of psychological testing was concluded to be an important variable in studies of psychological deficits among brain-damaged Ss.—*W. H. Guertin.*

8143. Haynes, Jack R., & Sells, S. B. (Texas Christian U.) **Assessment of organic brain damage by psychological tests.** *Psychol. Bull.*, 1963, 60(3), 316-325.—Approaches to the diagnosis of organic brain damage reflect diverse concepts of the nature of brain damage and of its behavioral effects. The principal approaches incorporated in published tests and research include diagnostic signs, single variable tests, scatter patterns, and qualitative techniques. A few investigators have used multiple variable batteries. Problems of selection of Ss and neurophysiological considerations are emphasized in the review. Although most tests were designed on the assumption of a unitary concept of organicity, the evidence supports the conclusion that brain damage is a multi-dimensional concept. A sequential multivariate measurement approach, including accurate neurological data, is required. Factors other than brain damage may influence the behavior of brain damaged persons. (75 ref.)—*Journal abstract.*

8144. Milligan, J. R. (VA Hosp., Long Beach) **Haptic hallucinations: Report of a case.** *Bull. Los Angeles Neurol. Soc.*, 1963, 28(1), 37-38.—The term "haptic hallucination" is used to describe the phenomenon of perception of a tactile sensation when there is no external object present. Nielsen (*Bull. Los Angeles Neurol. Soc.*, 1960, 25(4)) described 5 patients with haptic hallucinations, specifically, the feeling of a sudden, painless jolt or "thump" to the head. The hallucination may be the only manifestation or may be followed by a grand mal or psychomotor attack. The cases to date suggest that the seizures are secondary to temporal lobe pathology. The author presents a 6th case and reports that no other cases than Nielsen's have been published.—*I. N. Mensh.*

8145. Reed, Homer B. C., Jr., & Reitan, R. M. (Indiana U. Medical Cent.) **Intelligence test performance of brain damaged subjects with lateralized motor deficits.** *J. consult. Psychol.*, 1963, 27(2), 102-106.—The Wechsler-Bellevue Intelligence Test was administered to groups of brain damaged Ss having lateralized motor deficits, brain damaged Ss with no lateralized motor deficits, and control Ss having no brain damage. The results indicated that brain damaged Ss with right-sided motor deficits demonstrate different kinds of intellectual impairment than brain damaged Ss with left motor deficits and, additionally, that the intellectual impairment is a function of the lateralization of cerebral dysfunction rather than reflecting the motor handicap per se. The significance of the findings was briefly discussed.—*Journal abstract.*

8146. Scott, Thomas R., Bragg, Robert A., & Smarr, Roy G. (VA Hosp., Columbia, S. C.) **Brain damage diagnosis with the MMG.** *J. consult. Psychol.*, 1963, 27(1), 45-53.—A method for measuring the speed of the spiral aftereffect is described. Results of measurements on a group of 51 brain damaged and 37 control Ss are presented. Both binocular and interocular transfer conditions were used. It was found that brain damaged Ss varied

over a much greater range than did controls. Also, the brain damaged S's aftereffect varied more from time to time. Among controls, interocular transfer aftereffect was found to be as great, if not greater, than the binocular aftereffect. Among brain damaged Ss, the interocular transfer and the binocular aftereffect displayed a patterning which was significantly different from that of controls. Measurement of aftereffect rate by the method described (metamegraph) shows promise as an indicator of presence or absence of brain damage. (28 ref.)—*Journal abstract.*

8147. Winkler, W. Th. (Landeskrankenhaus, Gutersloh, Westfalen, Germany) **Die Beziehungen zwischen frühkindlicher Hirnschädigung und Neurosen im Kindes und Jugendalter.** [Relations between brain damage in early childhood and neuroses in childhood and adolescence.] *Z. Psychother. med. Psychol.*, 1962, 12(1), 1-10.—Children with brain damage are in need of more unwavering parental love than normal children. Puberty (when criminal deviations and neurotic symptoms are most apt to develop) represents the most critical period in the lives of such children. In mild cases, patients and understanding may bring about disappearance of psychic peculiarities. Differential diagnosis between psychic deficiencies of organic etiology and psychic reactive peculiarities is possible only to a certain degree.—*I. Neufeld.*

Cerebral Palsy

8148. Irwin, Orvis C., & Jensen, Paul J. (Wichita U.) **A test of sound discrimination for use with cerebral palsied children.** *Cerebral Palsy Rev.*, 1963, 24(2), 5-11.—The standardization of the 30-item test for children 6-16 years of age is described. Kuder-Richardson reliability was .87. The means of scores of children diagnosed medically as mild, moderate, and severe were alike. No statistically significant differences between the means for spastics and athetoids was found.—*T. E. Newland.*

8149. Lacey, Harvey M. (Pittsburgh Child Guidance Center, Pa.) **Pre-conditions for the psychological evaluation of young cerebral palsied children.** *Cerebral Palsy Rev.*, 1962, 23(6), 12-14.—The discussion deals with patient factors (personality, nature and degree of physical disabilities, attitudes toward the examination, and fatigue), the stimulus conditions (the stimulus value of the examiner, the matter of test items and instructions), and extrinsic factors (the physical environment for the testing, and the problem of the presence of the parent).—*T. E. Newland.*

8150. Linde, Thomas. (United Cerebral Palsy, Milwaukee, Wis.) **Accent on assets: Two problems in psychology and cerebral palsy: I. Individual personality.** *Cerebral Palsy Rev.*, 1962, 23(6), 3-4, 11.—Part I is concerned with problems of individual adjustment: frustration, guilt, inferiority, and idolization.—*T. E. Newland.*

8151. Linde, Thomas. (United Cerebral Palsy, Milwaukee, Wis.) **Accent on assets: Two problems in psychology and cerebral palsy: II. Social interaction.** *Cerebral Palsy Rev.*, 1962, 23(6), 5-6, 19.—Part II develops the point that, along with the cultivation of desirable insights and self-perceptions in cerebral palsied persons, "the public needs help in learning to be rationally discriminant in its responses

to the multitudinous stimuli presented by individuals with disability."—*T. E. Newland.*

8152. Sato, Chiyoko. (Tokyo, Japan) The change of voice in cerebral palsied boys. *Cerebral palsy Rev.*, 1962, 23(6), 7-11.—Observations made every 3 years over a period of 6-9 years are reported on 26 Japanese junior and senior high school children, of whom 14 were spastics and 7 were athetoids. None showed 1-octave lowering of the pitch range, although the majority underwent changes at the expected chronological ages. In the cases of those having original serious speech difficulties, observation of change was "almost impossible." Details on magnitude and nature of shift of pitch are presented.—*T. E. Newland.*

MENTAL RETARDATION

8153. American Association on Mental Deficiency. Symposium: Attention and activity level of the mentally retarded. *Train. Sch. Bull.*, 1963, 59(4), 132-160.—The following papers were presented at the 86th Annual Meeting of the association on May 4, 1962: "Introductory Remarks" (Anne M. Ritter), "Theory in Research in Activity Level" (R. L. Cromwell), "Studies on Distractibility: A Progress Report" (J. Schulman, Frances M. Thorne, J. C. Caspar), "Over-Attention to Moving Stimuli as a Factor in the Distractibility of Retarded and Brain Injured Children" (G. H. Zuk), and "Discussion" (M. Garrison).—*V. S. Sexton.*

8154. Arnold, Carol B. (Colorado State Home Training School, Wheat Ridge, Colo.) Feeding suggestions for the severely retarded child in the institution. *Amer. J. occup. Ther.*, 1962, 16(6), 290-292.—A description of some of the equipment and techniques used for the feeding training of severely handicapped children in a state institution for the mentally retarded.—*M. A. Seidenfeld.*

8155. Canella, B. Indagini sulla recuperabilità sociale di un gruppo di fanciulli anormali psichici, intellettivi e caratteriali. [Researches on social recovery in a group of psychologically, intellectually, and characterologically abnormal children.] *Difesa soc.*, 1961, 40(4), 98-120.—Follow-up of 200 mental defectives over 18 years of age who had been diagnosed at school age. Probability of recovery is proportional to the intellectual level ascertained in early age.—*L. L'Abate.*

8156. deHaan, Henry J., & Wischner, George J. (U. Pittsburgh) Three-dimensional objects versus projected color photographs of objects as stimuli in learning-set formation by retarded children. *J. comp. physiol. Psychol.*, 1963, 56(2), 440-444.—2 experimental situations, emphasizing differences in stimulus characteristics, yielded no significant differences in learning-set formation by 70 institutionalized retarded children. A Wisconsin apparatus employed laboratory-fabricated objects for $\frac{1}{2}$ the Ss; for the remaining $\frac{1}{2}$, colored slides of these stereometric objects were projected in a specially developed automatic apparatus. The highly comparable performance of the groups is surprising in view of other differences between experimental conditions, particularly those related to degree of spatial contiguity between cue, response, and reinforcement, and availabil-

ity of tactile and kinesthetic cues. (17 ref.)—*Journal abstract.*

8157. Horowitz, Frances Degin. (U. Kansas) Partial and continuous reinforcement of vocal responses using candy, vocal, and smiling reinforcers among retardates. Part I. *J. speech hear. Disord. monogr. Suppl.*, 1963, No. 10, 55-69.—60 mentally retarded children ranging in IQ from 36 to 78 and having Parsons Language Sample scores from 53.6 to 70.0 were randomly assigned to treatment and reinforcement groups. 5 reinforcement stimuli—candy, vocal, smiling, candy-vocal and vocal-smiling—were studied under conditions of partial, 50%, and continuous 100% reinforcement. The combination of candy-vocal reinforcers tended to be most effective.—*M. F. Palmer.*

8158. Irwin, Orvis C. (U. Wichita) The applicability of an articulation test with mentally retarded children. *Cerebral Palsy Rev.*, 1963, 24(1), 3-8.—The author's test was administered to 162 mentally retarded noncerebral-palsied children (CA 3-0 to 15-8; MA 2-7 to 12-8; IQ 30-80—test unspecified). It is concluded that the test "is not as precise a measuring instrument with (these) mentally retarded children as with (former) cerebral palsy subjects. Although this test may be used for an evaluation of the articulation of mentally retarded children (better for vowels than for consonants), the results obtained from these subjects should be interpreted with caution."—*T. E. Newland.*

8159. Mecham, Merlin J., & Jex, J. Lorin. (U. Utah) Training mentally retarded children in oral communication. *ASHA*, 1962, 4(12), 441-443.—The development of speech and language in the normal is paralleled in the mentally retarded. Clinical work in speaking and listening as specific skills does not necessarily effect improvement in language development. The general objectives for training mentally retarded children in communication are the creation of a stimulating and motivating psychological climate, the use of concrete experiences, the presentation of verbal symbols as labels for experiential concepts as these are being developed, and the use of standardized developmental schedules in verbal language as a tool in the measurement of readiness and improvement.—*M. F. Palmer.*

8160. Olshansky, S., & Kettell, Marjorie. (Childrens Developmental Clinic, Cambridge, Mass.) Attitudes of some internes and first-year residents toward the institutionalization of mentally retarded children. *Train. Sch. Bull.*, 1963, 59(4), 116-120.—40 internes and 1st-year residents in 4 private hospitals in the greater Boston area were interviewed. They had limited exposure to and interest in mental retardation. The majority favored keeping the pre-school mentally retarded child at home. Almost all opposed the separation of mother and retarded baby at time of delivery. Most considered themselves, rather than the parents, as the decision makers concerning institutionalization.—*V. S. Sexton.*

8161. Penney, R. K., & McCann, B. (U. Texas) Application of originality training to the mentally retarded. *Psychol. Rep.*, 1962, 11(2), 347-351.—18 retardates were required to free associate to 2 lists of words (training list and test list), then were

given the Unusual Uses Test. The experimental group was presented 3 times with the training list under instructions to respond with a different word on each trial (originality training). The control group, matched for MA and sex, received only 1 presentation of the training list. "The experimental group emitted more unusual uses and more original uses than did the control group on the Unusual Uses Test. There was no difference between groups on the test list."—*B. J. House.*

8162. Siegel, Gerald M. (U. Minnesota) **Adult verbal behavior in "play therapy" sessions with retarded children. Part I.** *J. speech hear. Disord. monogr. Suppl.*, 1963, No. 10, 34-38.—8 children from the Parsons, Kansas, State Hospital and Training Center, selected on the basis of being in the lower 52% of the Parsons language sample and the upper 25% with 6 or fewer errors on the Templin-Darley Screening Test of Articulation, were used to study the adult verbal behavior of 2 normal adults. Mean language response did not change significantly for the 2 groups, although the results were considerably lower than the mean language values reported for 8-year-olds by Templin.—*M. F. Palmer.*

8163. Siegel, Gerald M., & Harkins, Jerome P. (U. Minnesota) **Verbal behavior of adults in two conditions with institutionalized retarded children. Part II.** *J. speech hear. Disord. monogr. Suppl.*, 1963, No. 10, 39-46.—21 junior college students each met one high level child and one low level child as measured on the Parsons Language Sample in a structured and an unstructured situation. 5 measures of verbal behavior of the adults were extracted. Analysis showed that with high level children adults used more responses, Mean Language Responses, and higher Type-Token Ratios.—*M. F. Palmer.*

8164. Siegel, Gerald M. (U. Minnesota) **Verbal behavior of retarded children assembled with pre-instructed adults. Part III.** *J. speech hear. Disord. monogr. Suppl.*, 1963, No. 10, 47-53.—10 adult normal females split into 2 groups. 5 of them, trained in a relatively permissive approach and 5 simply required to interview children, tested 40 girls ranging in age from 13 yr. 9 mo. to 17 yr. with 20 drawn from the upper 25% of their age range and the remaining from the 25th and 50th percentiles on the Parsons Language Sample. Each adult met individually 4 children, 2 high and 2 low verbal level, for 15 min. sessions. Only on the number of adult questions and the Type-Token Ratio did adults clinically trained differ from those who were not so trained.—*M. F. Palmer.*

8165. Silverstein, A. B., & Mohan, Philip J. (Pacific State Hosp.) **Conceptual area analysis of the test performance of mentally retarded adults.** *J. abnorm. soc. Psychol.*, 1963, 66(3), 255-260.—The Object Sorting Test from the Goldstein-Scheerer battery and the Similarities subtest of the WISC were administered to 50 mentally retarded adults and scored by means of McGaughan and Moran's conceptual area analysis. Age, IQ, and length of hospitalization were significantly related to a number of the conceptual area measures, whereas sex and diagnosis were generally unrelated to these measures. There was some evidence of consistency in performance on the 2 conceptual tests, but the 2 parts of the Object Sorting Test seemed not to be measuring the

same thing. It was suggested that for retardates, at least, the basic dimensions of conceptual area analysis are not independent. The abnormal concreteness of the retarded appears to differ from that of both schizophrenics and brain damaged individuals. (15 ref.)—*Journal abstract.*

8166. Spradlin, Joseph E. (U. Kansas) **Assessment of speech and language of retarded children: The Parsons language sample.** *J. speech hear. Disord. monogr. Suppl.*, 1963, No. 10, 8-31.—275 mentally retarded cases were examined on a language test based on Skinner's behavioral descriptions split into tact, echoic, intraverbal, comprehension, echoic gesture, intraverbal gesture, and mand tests. Vocal and nonvocal subsections seemed to be sampling relatively independent behavior, and the scores seemed to be useful in predicting at least a limited range of nontest language behavior.—*M. F. Palmer.*

8167. Zigler, Edward, & Williams, Joanne. (Yale U.) **Institutionalization and the effectiveness of social reinforcement: A three-year follow-up study.** *J. abnorm. soc. Psychol.*, 1963, 66(3), 197-205.—49 familial retarded children who had been tested on a simple 2-part satiation game 3 years earlier were retested on the same game. The children were divided into high and low preinstitutional social deprivation groups, and 2 reinforcement conditions were employed. On the original testing a positive relationship was found between social deprivation experienced and the effectiveness of social reinforcement ($p < .05$), with no significant reinforcement effects being found. On retesting, significant reinforcement condition effects were found ($p < .05$), but no significant preinstitutional deprivation effects. An examination of the differences in the children's performance in the 2 testings revealed a significantly greater enhancement in the effectiveness of social reinforcement for the low than for the high socially deprived Ss ($p < .01$). (17 ref.)—*Journal abstract.*

BEHAVIOR PROBLEMS

8168. Kohen-Raz, Reuven. (Jerusalem, Israel 3 Schillerstr.) **Versuch einer klinischen Typologie gestörter Jugendlicher und die Möglichkeit ihrer Koedukation.** [Attempt of a clinical typology of disturbed youngsters and the possibilities of their coeducation.] *Z. exp. angew. Psychol.*, 1962, 9(4), 594-624.—Descriptive types of disturbances and their manifestations in boys and girls are given. The prognosis for successful coeducation is evaluated and constructive suggestions toward a solution of the educational problems are presented.—*W. J. Koppitz.*

8169. Llorens, Lela A., & Rubin, Eli Z. (La-fayette Clinic, Detroit, Mich.) **A directed activity program for disturbed children.** *Amer. J. occup. Ther.*, 1962, 16(6), 287-289.—A graded activity program of occupational therapy for disturbed children is described. This program is based on the findings of an earlier research study relative to the needs of this disability group. The program consists essentially of a structured activity program using a directive teaching approach designed to bring about significant changes in skills leading to improved performance and make a definite contribution to the therapeutic plan for emotionally disturbed children.—*M. A. Seidenfeld.*

Sex Deviation

Drug Addiction

8170. Joint Committee of the American Bar Association & the American Medical Association on Narcotic Drugs. *Drug addiction: Crime or disease?* Bloomington, Ind.: Indiana Univ. Press, 1961. xiv, 173 p. \$2.95.—The joint committee was formed in 1956 "to determine whether the two Associations can or should agree upon common principles or a common course of action" with respect to the problem of narcotic drugs. The reports express dissatisfaction with existing medical and legal approaches to the problem of drug addiction. In an appendix the psychological, social, medical, and legal aspects of the problem are surveyed. Another appendix summarizes narcotic drug laws, regulations, and policies in Great Britain and other European countries. Among the final recommendations, the joint committee urges clarification of the role of medicine and public health in treatment programs. Needed areas of research are indicated, including the establishment of an experimental facility to explore the possibilities of outpatient treatment of drug addicts.—*S. Brotman.*

8171. Savitt, Robert A. (State U. New York) *Psychoanalytic studies on addiction: Ego structure in narcotic addiction.* *Psychoanal. Quart.*, 1963, 32(1), 43-57.—The personality structure of narcotic addicts is discussed. "Object relationships are on an archaic level and the addict is unable to experience love and gratification through the usual channels of incorporation and introjection. Tension and depression become unbearable and in the process of regression the ego is overwhelmed by the threat of disintegration. Like the neonate, the addict has no ability to bind tension. Because of the inability to tolerate delay he seeks an emergency measure which bypasses the oral route of incorporation in favor of a more primitive one, the intravenous channel. . . . The vicissitudes of early ego development and later ego maturation which facilitate fixation and encourage regression appear to play a dominant role in predisposing an individual to the development of the crippling, morbid craving."—*J. Z. Elias.*

Suicide & Homicide

8172. Breed, Warren. (Tulane U.) *Occupational mobility and suicide among white males.* *Amer. sociol. Rev.*, 1963, 28(2), 179-188.—"Interviews concerning 103 white male suicides between the ages of 20 and 60 in New Orleans disclosed considerable difficulty with a crucial male role—work—as seen in downward mobility (both intergenerational and worklife), reduced income and unemployment. These indices of low achievement are analyzed for several age and class groups. The drift hypothesis of pathology is examined and a modification offered. A structural-interactional theory of suicide is proposed."—*L. Berkowitz.*

8173. Pauleikhoff, B. *Unfreiheit, Schuld, Suicid bei seelisch Kranken.* [Loss of freedom, guilt, and suicide in the mentally ill.] *Confin. psychiat., Basel*, 1962, 5(2-3), 161-176.—A frequent assumption is that a person commits suicide because of guilt. But a study of clinical evidence shows the guilt feelings to

be more usually an expression of a pathological loss of freedom from which the suicide attempts to escape by his act. Genuine, in contrast to delusional, guilt, seeks to atone or make restitution rather than commit suicide.—*E. W. Eng.*

CRIME & DELINQUENCY

8174. Bacon, Margaret K., Child, Irvin L., & Barry, Herbert. (Yale U.) *A cross-cultural study of correlates of crime.* *J. abnorm. soc. Psychol.*, 1963, 66(4), 291-300.—In a sample of 48 nonliterate societies, frequency of theft and personal crime were separately correlated with a number of variables which were suspected to be casual factors in the development of crime. Lack or limitation of opportunity for the young boy to form an identification with his father was associated with both types of crime. A high degree of socialization anxiety in childhood and a high degree of status differentiation in adulthood were significantly associated with theft only; a general adult attitude of suspicion and distrust was more decidedly associated with personal crime. (17 ref.)—*Journal abstract.*

8175. Badami, H. D. *A psychological study of some factors of juvenile delinquency.* *Educ. Psychol. Rev., Baroda*, 1962, 2(2), 101-106.—2 matched groups of delinquent and nondelinquent school children—matched on age, intelligence, and economic status—were studied. Differences pertaining to the child, parents and siblings, and family were enumerated. Illegitimacy and broken homes were among the important factors in delinquency.—*U. Pareek.*

8176. Ball, John C. *Social deviancy and adolescent personality.* Lexington, Ky.: Univer. Kentucky Press, 1962. 119 p. \$3.00.—A cross-sectional multigroup comparison of environmental and personality factors with various types of deviant behavior among adolescents. Delinquents are compared with nondelinquents, white with negro students, high with low socioeconomic status, broken with unbroken homes, high achievers with low achievers, those rated by teachers as maladjusted with those not so rated. MMPI profiles were divided according to behavioral and environmental conditions which deviate from urban middle-class white norms. Ss were 9th grade public school students and incarcerated delinquents. The MMPI was shown to be a valid personality measure in a nonclinical adolescent population. Personality maladjustment was shown to be associated with delinquency. Deviant personality tendencies were more common among students from broken homes. Nondelinquent boys from broken homes were characterized by depressive reactions.—*G. Deskin.*

8177. Hoeck-Gradenwitz, Erik. *Die Behandlung der Psychopathen in den Strafanstalten.* [Treatment of psychopaths in penal institutions.] *Psychol. Rdsch.*, 1963, 14(2), 93-114.—Denmark's penal institutions maintain an extensive program in psychotherapy for the rehabilitation of psychopathic criminals. Depending upon diagnosis, anamnestic analysis and group therapy, milieu therapy, in some cases even castration, are used in order to help a person find a way of staying out of trouble. Therapeutic care extends beyond the prison term. Adjustment is regularly supervised after discharge during a probation period. After that, a former convict has the possibil-

ity to return for advice whenever he feels that he cannot cope with his problems.—*W. J. Koppitz.*

8178. Johnston, Norman; Savitz, Leonard, & Wolfgang, Marvin E. (Eds.) (U. Pennsylvania) *The sociology of punishment and correction.* New York: Wiley, 1962. xi, 349 p. 6.50 (cloth), \$4.25 (paper).—A selection of 50 readings from the literature. The material is grouped in the following sections: "The Administration of Justice," "The Prison Community," "Treatment," "Prediction," and "Prevention." Brief introductory remarks precede each section.—*L. S. Kogan.*

8179. Knapp, Robert R. (USN Personnel Research Activity, San Diego, Calif.) *Personality correlates of delinquency rate in a Navy sample.* *J. appl. Psychol.*, 1963, 47(1), 68-71.—A study to determine whether personality scales measuring social maturity and conformity were related to delinquency rate in a group of 92 Navy brig confinees. The Socialization scale of the California Psychological Inventory and the Conformity scale of the Survey of Interpersonal Values each correlated significantly with a delinquency criterion obtained by correlating the scales against number of offenses committed and partialing out length of service. While the validities obtained for both the Socialization and Conformity scales were in the expected direction, the difference between means for the present delinquent and other nondelinquent groups on the Conformity scale is not in accord with the validity obtained. Differences in mean scores between the present delinquent sample and those presented for high school samples were in the expected direction for the Socialization scale.—*Journal abstract.*

8180. McCord, Joan; McCord, William, & Alan. (Stanford U.) *Family interaction as antecedent to the direction of male aggressiveness.* *J. abnorm. soc. Psychol.*, 1963, 66(3), 239-242.—In a longitudinal study of antisocial aggressiveness in males, reports on direct observation of behavior in childhood and early adolescence were used to rate general level of aggressiveness. Criminal records were used to ascertain antisocial behavior during adolescence and adulthood. To distinguish between conditions which contribute to socialized aggressiveness and those which direct aggression into antisocial channels, the family backgrounds of men who had been equally aggressive in childhood were compared. The results suggest that extreme neglect and punitiveness, coupled with a deviant-aggressive paternal model produces antisocial aggressiveness. In contrast (thought not contradiction), moderate neglect, moderate punitiveness, and ineffective controls produce socialized aggressiveness.—*Journal abstract.*

8181. Panton, James H. *Use of the MMPI as an index to successful parole.* *J. Crim. Law Criminol. police Sci.*, 1962, 53(4), 484-488.—"The MMPI profiles of a group of parole violators were compared with a sample of parole non-violators and with a sample of 2,198 prison admissions. All three samples were drawn from the research files of the North Carolina Prison Reception Center. The non-violators were found to present significantly less pathological profiles than the violators or admissions. . . . An item analysis was employed in the identification of 26 MMPI items which successfully distinguished the violators from the non-violators. These

items were designated the PaV scale. . . . The PaV scale was found to identify successfully 80.5% of both the violator and non-violator groups. Validation was determined on a recent group of violators of which 78.6% were successfully identified by the PaV scale."—*C. T. Morgan.*

8182. Perry, Thomas L. (California Inst. Technology, Pasadena) *N-methylmetanephine: Excretion by juvenile psychotics.* *Science*, 1963, 139 (Whole No. 3555), 587-589.—3 out of 18 psychotic children excreted N-methylmetanephine, a metabolite of N-methylepinephrine. It is not clear whether this tertiary amine plays a part in causing some forms of psychosis or is merely a secondary result of mental dysfunction. Urinary excretion of bufotenin and of 3,4-dimethoxyphenylethylamine, each of which has been reported elevated in some adult schizophrenics, was not unusual in these children.—*Journal abstract.*

8183. Reifen, David. (Tel Aviv, Israel) *Bet mishpat lanoar.* [Court for adolescents and its way of treating young offenders.] Jerusalem, Israel: Ministry Education Culture & Szold Institute Child Youth Welfare, 1962. 47 p.—This is intended for youth leaders. After an historical sketch, the psychological and educational means of juvenile courts are explained, as well as the significance of laws and court procedures. Methods of treatment are broadly described. Cases taken from life in Israel are given. "In most of them improvement is possible," provided that the young offenders's life circumstances and his personality are considered.—*H. Ormian.*

8184. Shelley, Ernest L. V., & Toch, Hans H. *The perception of violence as an indicator of adjustment in institutionalized offenders.* *J. Crim. Law Criminol. police Sci.*, 1962, 53(4), 463-469.—2 different pictures were measured to the left eye and right eye by means of a stereoscope to a group of prisoners. One picture was a scene of violence, the other neutral; otherwise the 2 were structurally matched. The 11 Ss, seeing the highest percentage of violent pictures, were matched with a control group of prisoners. The 2 groups were more sharply differentiated by Rorschach scores than by other test measures. 7 out of 11 in the test group were committed for some act of antisocial behavior.—*C. T. Morgan.*

8185. Strodtbeck, F. L., Short, J. F., & Kolegar, Ellen. (U. Chicago) *The analysis of self-descriptions by members of delinquent gangs.* *Sociol. Quart.*, 1962, 3(4), 331-356.—A 14-item paired-comparison adjective list was administered to 23 members of a Negro delinquent group and to 23 nongang members who were matched on race, age, and location of residence. Among the methodological problems considered were the consistency of the paired comparisons, the social desirability of the adjectives, alternative means of determining the similarity between self-descriptions, and the correspondence between self-reports concerning delinquent behavior and O reports. Among the major substantive findings were the following: 2 patterns of self-descriptions emerged from the boys—the "cool aggressive" pattern composed of "troublesome, cool, tough, and mean" and the "scout" pattern composed of "loyal, clean, helpful," etc. There were significantly more "cool aggressives" in the gang than in the nongang population. Reciprocated sociometric choices tended

to occur more frequently between boys with similar self-descriptions, but there was a general trend for the "cool aggressives" to be overchosen by all types of gang members. On the basis of self-reports of delinquent activities, the "cool aggressives" gambled more, made money illegally, and engaged in more heterosexual activity than the "scouts." The same trend was evident in the O's report but was not significant.—*K. E. Davis.*

8186. Walters, Richard H., Callagan, John E., & Newman, Albert F. (U. Toronto, Canada) **Effect of solitary confinement on prisoners.** *Amer. J. Psychiat.*, 1963, 119(8), 771-773.—40 long-term prisoners at a federal penitentiary volunteered to serve as Ss in a study of the effects of solitary confinement. 20 men were placed in isolation cells for 4 days and 20 served as controls. Results showed some increase in anxiety but no mental or psychomotor deterioration or increased susceptibility to social influence. These results may be, in part, a function of the personality characteristics and history of prisoners or of such prison conditions as lack of privacy.—*N. H. Pronko.*

PSYCHOSES

8187. Fish, Frank. (U. Edinburgh) **The functional psychoses in the light of Hebb's theory.** *Confin. psychiat., Basel*, 1962, 5(2-3), 130-150.—"The clinical features of manic-depressive insanity and schizophrenia" derive from "disordered activity of the thalamic reticular system and the mesencephalic reticular systems respectively. . . . In depression the thalamic reticular system is under-active, leading to a lack of variation in the progress of the phase sequences and the dominance of well-worn phase sequences representing basic anxieties. . . . Mania is the result of excessive activity of the thalamic reticular system, since this brings about an increased variation in the phase sequences. . . . In schizophrenia the initial disorder is undue activity of the caudal part of the reticular system which at first produces a paranoid attitude because sensations play an undue part in the central process."—*E. W. Eng.*

8188. Hamilton, Vernon. (Springfield Hosp., London, England) **Size constancy and cue responsiveness in psychosis.** *Brit. J. Psychol.*, 1963, 54(1), 25-39.—An experiment is reported designed to re-assess size constancy behavior and some of its correlates in psychotic and nonpsychotic Ss. The predictive basis of reduced size constancy for schizophrenic and nonschizophrenic psychotic patients was found in the clinical evidence characterizing these conditions and in Piaget's genetic theories of cognitive development. It was postulated that there would be no significant difference in size constancy between different psychotic groups or between different nonpsychotic groups, but that the psychotic groups would show significantly reduced size constancy compared with the nonpsychotic sample. It was further postulated that low size constancy would be positively related to reduced cue responsiveness operationally defined in several different ways. Size constancy and cue responsiveness in relation to familiar and non-familiar objects are assessed. The results are taken to provide a considerable degree of support for the hypotheses, and are explained in terms of peripheral as well as central mechanisms. The findings do not support previous evidence suggesting a causal rela-

tionship between low size constancy and underestimation of distance. (28 ref.)—*Journal abstract.*

Schizophrenia

8189. Brzezicki, E. **Über Schizophrenien, die zu einem sozialen Aufstieg führen.** [Schizophrenias that result in social rise.] *Confin. psychiat., Basel*, 1962, 5(2-3), 177-187.—Periods of schizophrenia have marked turning points toward heightened creativity in the lives of poets, writers, and scientists in particular. Comte, de Nerval, and a famous Polish philosopher are discussed in detail as illustrations from the writer's files that contain numerous examples of persons still living and less well-known.—*E. W. Eng.*

8190. D'Alessio, Gerald R., & Spence, Janet Taylor. (Lakeland Guidance Cent., Pompton Lakes, N. J.) **Schizophrenic deficit and its relation to social motivation.** *J. abnorm. soc. Psychol.*, 1963, 66(4), 390-393.—A study investigating the effects of praise and encouragement on the performance of schizophrenics was carried out with 48 normal and 48 hospitalized schizophrenics, the latter being drawn equally from open and closed wards. All Ss performed a simple motor task, those in the experimental groups receiving verbal praise and encouragement from E after each trial and those in the control groups no evaluative comments. The results indicated that all experimental groups performed better than their controls but that the amount of improvement did not differ among the diagnostic groups. In absolute performance level, normals were significantly superior to the schizophrenics but the 2 schizophrenics groups did not differ significantly from each other.—*Journal abstract.*

8191. Higgins, Jerry, & Mednick, Sarnoff A. (U. Michigan) **Reminiscence and stage of illness in schizophrenia.** *J. abnorm. soc. Psychol.*, 1963, 66(4), 314-317.—When given a repetitive inverse alphabet printing task to perform for 5 min. of massed practice, Early Stage schizophrenics (N=16) displayed a greater degree of improvement in performance (reminiscence) after a 2-min. rest than did Advanced Stage schizophrenics (N=16). Early Stage and Advanced Stage schizophrenia were defined in terms of a theory of schizophrenia which postulates differential levels of arousal as characteristic of the stages of the disorder.—*Journal abstract.*

8192. Lebow, Kenneth E., & Epstein, Seymour. (U. Massachusetts) **Thematic and cognitive responses of good premorbid schizophrenics to cues of nurturance and rejection.** *J. consult. Psychol.*, 1963, 27(1), 24-33.—21 good premorbid schizophrenics and 21 matched controls were tested with pictures of mother, father, and peer figures represented in nurturant, ambiguous, and rejecting interaction with a boy-hero. The schizophrenics were found to have elevated reaction times to peer pictures following mother pictures (.01 level), obtained relatively low scores of p Nurturance (.05 level), produced flat gradients of p Nurturance as a function of cues varying from rejection to nurturance (.01 level), described mother figures as particularly rejecting (.05 level) and tended (.01 level) to produce their poorest responses to nurturant cues and their best responses to ambiguous scenes. It was suggested that good premorbid deny emotion and prejudge others as reject-

ing as a defense against emotional involvement. Rather than a specific "censure-cue deficit," schizophrenics exhibit deficit for cues of emotional involvement, in general.—*Journal abstract.*

8193. Moore, Robert A., & Selzer, Melvin L. **Male homosexuality, paranoia, and the schizophrenias.** *Amer. J. Psychiat.*, 1963, 119(8), 743-747.—128 paranoid schizophrenics and a control group of 77 nonparanoid schizophrenics were compared in an attempt to determine the possible role of homosexuality in the etiology of paranoia. The results showed that, to a statistically significant degree, the "paranoids showed greater incidence of past overt homosexual acts, preoccupation during therapy with homosexuality, and were judged latently homosexual more often by psychiatrists and testing psychologists." However, since evidences of homosexuality were also found in nonparanoids, other factors must be found to explain the essential paranoid process.—*N. H. Pronko.*

8194. Nelson, S., & Caldwell, W. E. (George Washington U.) **Perception of affective stimuli by normal and schizophrenic subjects in a depth perception task.** *J. gen. Psychol.*, 1962, 67(2), 323-335.—The Howard-Dolman depth perception apparatus was used. Stimulus drawings of a man, woman, dog, and circle were used; a movable post measured depth-perception accuracy. 22 schizophrenic and 22 "normal" Ss were employed in the study. Distance estimates were obtained by measuring the distance of each stimulus from the S in terms of a fixed standard. 2 main hypotheses were set forth. (a) Schizophrenics are able to perceive depth relationships accurately and maintain their performance in a perceptual task where threat is minimal. (b) Schizophrenics and "normals" differ in their arrangement of stimuli in a depth perception task, and this difference is in accordance with each groups relatedness to the symbolic values of the stimuli. It was found that there was no difference between schizophrenics and "normals" in accuracy of depth perception, although differences did exist in stimulus placement between the 2 groups. The variability of performance on the part of the schizophrenics suggests many possible hypotheses pertaining to the dynamics and nature of their phenomenological fields.—*Author abstract.*

8195. Norman, Russell P. (Queens Coll., Charlotte, N. C.) **Level of aspiration and social desirability in chronic schizophrenics.** *J. consult. Psychol.*, 1963, 27(1), 40-44.—The relationship between response to social desirability (SD) and level of aspiration behavior (LA) was studied in a chronic schizophrenic population. 107 hospitalized schizophrenics were given a modified form of the Edwards SD scale and were rated as to mental health (MH) status. 4 experimental groups of 12 Ss each were formed representing the high and low extremes on each variable. All Ss were given 10 trials on a letter-digit substitution task and their LA was obtained after each trial. Results indicated that the performances of the high SD Ss were superior ($p < .05$), and discrepancy scores (LA minus performance) were significantly related to the MH variable ($p < .01$), with low MH groups having negative and high MH groups positive discrepancy scores. The use of MH in combination with SD was valuable in demonstrating the existence of several major behavioral varia-

tions in a group of chronic schizophrenics. (22 ref.)—*Journal abstract.*

8196. Pearl, David, & Berg, Paul S. D. (VA Hosp., Battle Creek, Mich.) **Time perception and conflict arousal in schizophrenia.** *J. abnorm. soc. Psychol.*, 1963, 66(4), 332-338.—The hypothesis that schizophrenics would exhibit greater distortion in estimation of duration time for stimuli relevant to their major conflicts than for other stimuli was investigated. 3 groups, each with 16 Ss who were homogeneous with respect to experiencing primary conflicts with either aggression, sex, or dependency, were formed. A factorial Latin square design was used in which Ss estimated stimuli durations following the tachistoscopic presentation at 4 exposure times of 4 pictorial stimuli, 1 of which represented their major conflict area. Results demonstrated that greatest distortions occurred for conflict pictures at the .001 level. Distortion elicitation of the aggression stimulus was greater than other stimuli at .001 for the combined schizophrenics, an effect not found with normal control Ss.—*Journal abstract.*

8197. Satz, P., & Baraff, A. S. (VA Hosp., Lexington, Ky.) **Changes in the relation between self-concepts and ideal concepts of psychotics consequent upon therapy.** *J. gen. Psychol.*, 1962, 67(2), 291-298.—This study was designed to test 2 major contentions of self-theory: (a) self-ideal sort discrepancies are characteristic of inadequate self-organization and poor psychological adjustment, and (b) that such discrepancies between self and ideal correlations are reduced as a result of client-centered therapy. This study investigated the above hypotheses with 16 nonchronic schizophrenic patients in a state hospital using group psychotherapy and intensive occupational therapy for an experimental period of 10 weeks. An additional attempt was made to consider the problem of defensive sortings with seriously disturbed patients. Results from hypothesis 1 lent further support to self-theory, while results from both tests of hypothesis 2 failed to support the predicted reductions in self-ideal discrepancies. Several alternative explanations were advanced.—*Author abstract.*

8198. Vandenberg, S. G. (U. Louisville) **La mesure de la deterioration de la compréhension sociale dans la schizophrénie.** [The measurement of deterioration of social understanding in schizophrenia.] *Rev. Psychol. appl.*, 1962, 12(3), 189-199.—"A new test of social understanding is described. The test requires forced-choice judgments between two verbal labels for each of 90 pictures of facial expressions, grouped into 9 categories. The performance of 37 schizophrenics differed significantly from the performance of 14 non-schizophrenic mental patients. Correlations with other tests indicate that verbal intelligence does not account for this finding nor did other tests of social understanding discriminate as well, although they correlated fairly highly with the new technique." (English summary)—*E. G. White.*

Affective Disorders

Physiological Correlates

8199. Fotherby, K., Ashcroft, G. W. Affleck, J. W., & Forrest, A. D. (Postgraduate Medical School, London, England) **Studies on sodium transfer and 5-hydroxyindoles in depressive illness.** *J. Neurol.*

Neurosurg. Psychiat., 1963, 26(1), 71-73.—The rate of transfer of isotope labelled sodium (^{24}Na) from blood to cerebrospinal fluid of 11 schizophrenics was compared with that of 11 depressive patients. Data on 5-hydroxyindoles in blood and cerebrospinal fluid of these patients are also presented. No significant differences were obtained. The transfer rate of labelled sodium of 4 severely depressed patients without paranoid symptoms was lower than that of the group of depressed patients. Exercise appeared to increase the transfer rate.—*M. L. Simmel.*

PSYCHONEUROSES

8200. Brown, A. C., & Fry, J. (Maudsley Hosp., London, England) **The Cornell Medical Index Health Questionnaire in the identification of neurotic patients in general practice.** *J. psychosom. Res.*, 1962, 6(3), 185-190.—The Cornell Medical Index was offered to a total of 215 patients in a general practice and returned completed by 202. Patients clinically diagnosed as "neurotic" gave a significantly higher number of "yes" responses than other patients. The questionnaire separated neurotics from normals with "fair success."—*W. G. Shipman.*

8201. Leuner, Hanscarl. (v. Siebold Strasse 5, Göttingen, Germany) **Die Bedeutung des epochalen Entwicklungswandlens für die Disposition zu Neurosen und psychosomatischen Erkrankungen im Jugendalter.** [The significance of epochal-developmental changes for the disposition to neuroses and psychosomatic diseases in childhood.] *Z. Psychother. med. Psychol.*, 1962, 12(1), 11-20.—The concept of "acceleration," i.e., faster biological development during childhood and adolescence, includes earlier maturation, higher end-goals of maturity, and a change of the definite somatic structural constitution. The functioning of the psychophysical Gestalt-changes seem to predispose one to neurotic decompensation and to influence the structure of the neuroses, the defense mechanisms, and also the "choice" of the psychosomatic symptoms.—*I. Neufeld.*

PSYCHOSOMATICS

8202. Bursten, Ben. (Yale U. School Medicine) **Psychological state and sputum eosinophilia.** *Psychosom. Med.*, 1962, 24(6), 529-534.—The daily ward behavior of an asthmatic woman was observed. When in her usual self-sufficient state there were few or no eosinophiles in her sputum; when she reacted with marked dependence, helplessness, and lassitude, her sputum was laden with eosinophiles. Subsequent attacks were then predicted from sputum eosinophile count.—*W. G. Shipman.*

8203. Chertok, L., Mondzain, M. L., & Bonnaud, M. (Rothschild Hosp., Paris, France) **Vomiting and the wish to have a child.** *Psychosom. Med.*, 1963, 25(1), 13-18.—Vomiting and the attitude toward the child were studied in 100 primiparous women, of whom 68 suffered from vomiting. Verbally expressed attitudes were studied by semistructured interviews. The results show a positive relationship between vomiting and ambivalence of attitude on the part of the mother toward the child. (18 ref.)—*W. G. Shipman.*

8204. Cleveland, S. E., & Johnson, D. L. (VA Hosp., Houston, Tex.) **Personality patterns in**

young males with coronary disease. *Psychosom. Med.*, 1962, 24(6), 600-610.—25 young males recently hospitalized for myocardial infarction were administered the Rorschach, TAT, Thaler Doctor-Patient Relationship Test, Mayman Self Concept Test, and a structured interview. In contrast with matched pre-operation cases, their Rorschachs had more penetration, space, death, anxiety, and hostility responses. The TATs, in contrast to those of matched skin patients, had despondent, nostalgic, and religious themes. All but one reported being happy only when busy. The Thaler test showed a great need for faith in the doctor. The Mayman test showed them success-driven and concerned with how others see them. (16 ref.)—*W. G. Shipman.*

8205. Fishbein, Gerald M. (VA Hosp., Brooklyn, N. Y.) **Perceptual modes and asthmatic symptoms: An application of Witkin's hypothesis.** *J. consult. Psychol.*, 1963, 27(1), 54-58.—The problem of tying personality formulations described by Witkin to behavioral correlates was investigated. The Rod and Frame Test and Embedded Figures Test were administered to 60 chronic asthmatic children who had been removed from their home environment. Rate of symptom alleviation following environment change and mode of perception were identified. Results indicated that rate of alleviation and length of time in a therapeutic milieu varied independently from perceptual mode. Also, asthmatic Ss tended to be more field dependent than the nonasthmatic standard. The negative results supported the contention that mode of perception may be an artifact of the experimental situation. The trend toward greater perceptual dependency of the asthmatics does lend some credence to both the description of the asthma personality and to Witkin's hypotheses.—*Journal abstract.*

8206. Gottesfeld, H. (Kings County Psychiatric Hosp., Brooklyn) **Body and self cathexis of super-obese patients.** *J. psychosom. Res.*, 1962, 6(3), 177-183.—30 super-obese patients were compared with 30 matched neurotic patients on "body cathexis" and "self-cathexis" through a self-drawing and a self-rating personality trait list. While the super-obese patients show a more negative "body cathexis" on the self-drawing they do not show a more negative "body cathexis" on the trait list.—*W. G. Shipman.*

8207. Lefer, L., Pleasure, M. A., & Rosenthal, L. (Bronx VA Hosp., NYC) **A psychiatric approach to the denture patient.** *J. psychosom. Res.*, 1962, 6(3), 199-207.—Neither psychiatric interviews nor expert dentists' hunches could predict the patient's choice of denture styles.—*W. G. Shipman.*

8208. Moos, R. H., & Engel, B. T. (U. California School Medicine, San Francisco) **Psychophysiological reactions in hypertensive and arthritic patients.** *J. psychosom. Res.*, 1962, 6(4), 227-241.—12 arthritic and 12 hypertensive women were startled by a loud noise after free associating to "poignant" or nonpoignant stimuli, e.g., "I am physically active." During this conditioning and subsequent generalization procedure, heart and respiration rate, skin conductance, and muscle potentials were recorded. The arthritics had sustained muscle potential elevation and blood pressure adaptation, while for the hypertensives it was the reverse. "The

results strongly support a theory of response specificity."—*W. G. Shipman.*

8209. Purcell, K., & Metz, J. R. (Children's Asthma Research Inst., Denver, Colo.) **Distinctions between subgroups of asthmatic children: Some parent attitude variables related to age of onset of asthma.** *J. psychosom. Res.*, 1962, 6(4), 251-258.—34 rapidly remitting asthmatic children (RR) were compared with 25 matched steroid dependent (SD) ones for age of onset and parental child rearing attitudes. The Parental Attitude Research Instrument was used. RR mothers scored significantly higher on 2 scales (Breaking the Will and Excluding Outside Influence). RR fathers scored higher on one (Harsh Punishment). While the groups did not differ in mean age of onset, the late onset RRs had the most autocratic, restrictive mothers.—*W. G. Shipman.*

8210. Purcell, K., Turnbull, J. W., & Bernstein, L. (Children's Asthma Research Inst., Denver, Colo.) **Distinctions between subgroups of asthmatic children: Psychological test and behavior rating comparisons.** *J. psychosom. Res.*, 1962, 6(4), 283-291.—84 asthmatic children were classified into 29 rapid remitters, 29 intermediates, and 26 steroid dependents. All Ss were administered the Porteus Maze Test, Children's Manifest Anxiety scale, a mood adjective checklist, Rorschach, Aggression Pictures Test, and the IPAT Children's Personality Questionnaire. A personality rating form was done on each child by houseparents. None of the procedures yielded statistically significant differences between subgroups. (24 ref.)—*W. G. Shipman.*

8211. Smith, R. E. (Portland State Coll.) **A Minnesota Multiphasic Personality Inventory profile of allergy: II. Conscious conflict.** *Psychosom. Med.*, 1962, 24(6), 543-553.—Responses of 76 allergic and 76 nonallergic individuals to inventory items were analyzed by the chi-square technique. The 54 items found to discriminate between the 2 groups (p. 05) were analyzed. The allergics were more dissatisfied with their family life; tended to alienate their friends by disparaging them; and were cynical, irritable, and grouchy, with no compensation techniques for their feelings of inferiority and inadequacy. (28 ref.)—*W. G. Shipman.*

Psychol.*, 1962, 32(3), 218-223.—"The significant expansion of educational research is . . . impossible at present, mainly because of the shortage of trained research workers." Suggestions to remedy this situation are made.—*B. T. Jensen.*

SCHOOL LEARNING

8221. Allahabad Government Central Pedagogical Institute. **An investigation into the students' understanding of some common geographical**

terms. *Shiksha*, 1963, 15(3), 140-144.—A test was administered to 303 students of 8th-grade standard. The test revealed that very little importance is given in schools to the practical side of geography. Less importance should be given to books and more to understanding.—*U. Pareek*.

8222. Carroll, John B. (Harvard U.) A model of school learning. *Teachers Coll. Rec.*, 1963, 64(8), 723-733.—"Briefly, our model says that the learner will succeed in learning a given task to the extent that he spends the amount of time that he needs to learn the task.—*H. K. Moore*.

8223. Cline, Victor B., Richards, James M., Jr., & Needham, Walter E. (U. Utah) Creativity tests and achievement in high school science. *J. appl. Psychol.*, 1963, 47(3), 184-189.—This study investigated the relative validities of a battery of "creativity tests" and an IQ test for predicting several indices of achievement in high school science. Criteria included grade-point average in science courses, percentile rank on the STEP Science Achievement Test, teacher rating of overall scientific potential, number of high school science courses taken, and a measure of involvement with science. Results indicated that the creativity tests did have considerable predictive validity against each criterion for each sex and that the criterion variance accounted for by the creativity tests is to a substantial degree independent of IQ. Contrary to findings of other investigators, teachers did not discriminate against highly creative pupils in their ratings.—*Journal abstract*.

8224. Lambert, Wallace E., Gardner, R. C., Barik, H. C., & Tunstall, K. (McGill U.) Attitudinal and cognitive aspects of intensive study of a second language. *J. abnorm. soc. Psychol.*, 1963, 66(4), 358-368.—Students attending a 6-week French Summer School were examined for attitudes toward French people and culture, their orientations toward learning a 2nd language, and their feelings of anomie at the start and end of the course. Attention was also given to modification in the meanings of French and translated-equivalent English concepts. Students at 2 levels of skill in French were compared. Results supported the theory that learning a 2nd language efficiently depends on an appropriate pattern of attitudes toward the other cultural group and a particular orientation toward language study. Anomie increased for both groups of students during the course. Students utilized the semantic features of both their languages and permitted the 2 to interact. This linguistic interdependence correlates positively with achievement.—*Journal abstract*.

8225. Armian, Haim. Hareka hapsikhologi laavodat hamore bekhitot 7-8. [The psychological basis of the teacher's work in the 7th-8th grades.] In Moshe Avigal & Uri Blum (Eds.), *Madrikh Lekhitot 7-8*. [Guide to Grades 7-8.] Tel Aviv, Israel: Tarbut Vehinukh, 1962. Pp. 9-17.—Later childhood is described as a slow transition stage to the adolescent period, and explained on its biological and especially its sociological background. The following topics are discussed: childhood, adolescence and adulthood from the psychological standpoint; increasing criticism; changes of interest and imagination; emotional experiences and sexuality; social psychology of later childhood; transition from childhood to preadolescence; and the individual.—*H. Ormian*.

8226. Saksena, Shakuntala. (U. Lucknow, India) Effects of pre-school training upon educational attainment and personality trait of children. *Shiksha*, 1961, 14(2), 106-117.—2 matched groups of 48 Ss each, consisted, respectively, of children who had preprimary education and those who did not. 4 tests were administered in addition to interviews. The tests were for reading and comprehension, writing, arithmetic, and free drawing. The results showed that preschool education did not give much advantage to the children in reading, writing, and drawing. They were slightly better in comprehension and arithmetic and markedly superior in personality traits.—*U. Pareek*.

8227. Scott, Lloyd. (U. California, Berkeley) A teaching investigation of the introduction of various radices into kindergarten and first-grade arithmetic. *Calif. J. educ. Res.*, 1963, 14(1), 3-10.—After teaching 6 kindergarten and 8 1st-grade groups notations in terms of radices of 10, 8, 5, 3, and evaluating by observation the success of the children in such notation, the author concludes that "it is possible to acquaint [such] children with some fundamental concepts about the organization of their number system through use of various radices."—*T. E. Newland*.

8228. Siegel, Laurence; Siegel, Lila Corkland; Capretta, Patrick J., Jones, Reginald L., & Berkowitz, Howard. (Miami U., Oxford, O.) Students' thoughts during class: A criterion for educational research. *J. educ. Psychol.*, 1963, 54(1), 45-51.—Relevance of student thinking during class presentations is proposed as a relatively sensitive and uncontaminated criterion for educational research. Reports of thinking were evoked by modifying the stimulated recall technique using video tape and group administration. These reports were independently classified along a continuum of "thinking relevance" by pairs of judges, and the resultant classifications were transformed to numerical weights determined by a paired-comparisons analysis. Reliability and validity of the stimulated recall procedure was evaluated across lectures ($n=3$) and "critical stops" within lectures ($n=12$). The median interrater reliability for critical stops was .58. Validity against an independent measure of student learning was .61. The use of at least 3 trials reflecting variations in student mood and interest is recommended.—*Journal abstract*.

8229. Zintz, Miles V. (U. New Mexico) Indian children in public school classrooms in New Mexico: Next steps in research. *N. Mex. Soc. Stud. Educ. educ. res. Bull.*, 1963(Mar), 12-18.—A review of studies conducted in the southwest on the inadequacy of minority group children in English. Biculturalism is contrasted with the more limited problem of bilingualism, and specific problems of teaching English as a 2nd language are discussed. Areas of needed research are delineated. (16 ref.)—*J. G. Cooper*.

INSTRUCTIONAL AIDS

8230. Arnsdorf, Val E. (U. California, Berkeley) Time and space terms in basal social studies materials. *Calif. J. educ. Res.*, 1963, 14(1), 23-29.—Counts were made on samples of 25 texts appropriate to Grades 1 through 7. Results showed no systematic progression over grade levels, and a preponderance of indefinite terms over definite terms, particularly pro-

nounced among the space terms. Spache and Dale-Chall readability formulae results correlated (mdn.) about .15 with the number of terms used (range in r's: -.33 to .68). Implications regarding the relationship between these conditions and the children's ability to comprehend are indicated.—*T. E. Newland.*

8231. Fessant, John M. (Oregon State School Deaf, Salem) **Application of programmed learning for deaf children to industrial arts.** *Amer. Ann. Deaf*, 1963, 108(2), 241-244.—The development of the teaching machine and its demonstration use are described. Details of the machine are presented.—*T. E. Newland.*

8232. Jordan, James A. (Emory U.) **Socratic teaching?** *Harv. educ. Rev.*, 1963, 33(1), 96-104.—It is concluded that neither teaching machines or most other teaching methods use the Socratic method of teaching by inquiry. Such a concept should be dropped from the vocabulary of the teaching machine devotees.—*C. M. Franks.*

8233. Niebler, R. David. (Atlas Chemical Industries, Wilmington, Del.) **Programmed instruction saves time—and grows.** *Personnel J.*, 1963, 42(5), 239-243.—Basic terms used in programmed instruction are defined.—*M. B. Mitchell.*

8234. Pressey, Sidney L. (U. Arizona) **Teaching machine (and learning theory) crisis.** *J. appl. Psychol.*, 1963, 47(1), 1-6.—Current programers are declared to be racing down a blind alley, misled by theory based on comparative studies whereas the important features of human learning of meaningful matter are largely unique to man. For such learning, there are indications that write-ins are less valuable than objective items, reinforcement not the significant process, programming destructive of cognitive structure. Objective autoinstruction adjunct to texts and other instructional matter is clearly most practicable, probably most learning-producing. Evaluations should compare this approach, as well as orthodox programmed learning, with conventional teaching. Research related to such endeavors should aid emergence of theory clarifying the distinctive features of human learning.—*Journal abstract.*

8235. Ripple, R. E., & Klausmeier, H. J. **Adjunct program to accompany "Learning and Human Abilities: Educational Psychology."** New York: Harper & Row, 1962. 336 p. \$3.50 (paper).—Designed to accompany the textbook by Klausmeier (see 36: 1KA62K), this book has a table of contents identical to that of the textbook. For each chapter there is a set of alternate-choice and a set of completion items. The correct answer is beside each item, but the student conceals this until he has responded. Recognition items are relatively easy; completion items, more difficult. The program was presented in classes before publication.—*C. T. Morgan.*

8236. Wittrock, M. C. (U. California, Los Angeles) **Response mode in the programming of kinetic molecular theory concepts.** *J. educ. Psychol.*, 1963, 54(2), 89-93.—A kinetic molecular theory program was taught to 80 elementary school children. The experimental group learned the completion item program by responding aloud. The control group listened to the same program without overtly responding. An analysis of variance evidenced an interaction between MA and response mode ($p < .05$). A 1-year

retention test evidenced a nonsignificant loss from the learning test. It was concluded that under certain conditions the overt response is probably important in determining the results of learning.—*Journal abstract.*

ATTITUDES & ADJUSTMENT

8237. Appley, Mortimer H., & Moeller, George. (York U.) **Conforming behavior and personality variables in college women.** *J. abnorm. soc. Psychol.*, 1963, 66(3), 284-290.—Conforming behavior of 41 freshman women, as measured in an Asch situation, was compared with the scales of the Edwards Personal Preference Schedule, the Gough California Psychological Inventory, and the Gordon Personal Profile. In the sample studied, only the Edwards' Abasement scale was able to generate a small but significant relationship (+.33) with a kind of behavior which should have been predictable from some 12 to perhaps 27 of the 38 measures used. Excepting the 5 scales of Gough's 18, on the basis of questionable comparability of samples, a total of 33 measures was correlated with conforming behavior. Only 1 was found to have construct validity for this type of social conformity criterion when tested on a sample of college women. (17 ref.)—*Journal abstract.*

8238. Astin, Alexander W. (National Merit Scholarship Corp., Evanston, Ill.) **Differential college effects on the motivation of talented students to obtain the Ph.D.** *J. educ. Psychol.*, 1963, 54(1), 63-71.—An attempt was made to identify differential college effects on the student's motivation to seek the PhD degree. An input-output design for controlling differential student input was applied in a 4-year longitudinal study of 6544 high aptitude students. PhD aspiration appeared to be negatively affected by the size of the student body, the percentage of males in the student body, and the Conventional Orientation in the college environment. The Social Orientation also affected PhD aspiration significantly, but the relationship was very complex. Attending a coeducational liberal arts college appears to increase the student's motivation to seek the PhD, whereas PhD aspiration tends to be reduced as a function of attending one of the northeastern men's colleges.—*Journal abstract.*

8239. Callard, M. P., & Goodfellow, C. L. (U. Exeter, England) **Neuroticism and extraversion in schoolboys as measured by the Junior Maudsley Personality Inventory.** *Brit. J. educ. Psychol.*, 1962, 32(3), 241-250.—All the boys aged 11 to 14 yr. 11 mo. under the jurisdiction of Exeter Education Authority and 32 volunteers from Devon County area were tested with the Junior Maudsley Personality Inventory ($N = 3559$). IQs were obtained from the 11 plus examinations. The higher status groups had lower neuroticism averages than the lower status groups. There was a tendency for neuroticism and intelligence to be positively correlated in the highest status groups, but negatively correlated in lowest groups. Neuroticism and extraversion varied with age: younger age, higher neuroticism, and lower extraversion.—*B. T. Jensen.*

8240. Chazan, M. (University Coll. Swansea, England) **School phobia.** *Brit. J. educ. Psychol.*, 1962, 32(3), 209-217.—33 cases of school phobia are analyzed and several variables examined. Most of

the group showed marked dependency and emotional immaturity. Educational pressures often played a prominent role. Suggested treatments are discussed. (15 ref.)—*B. T. Jensen.*

8241. DeJung, John E., & Gardner, Eric F. (U. Kansas) **The accuracy of self-role perception: A developmental study.** *J. exp. Educ.*, 1962, 31(1), 27-41.—Accuracy of self-role perception, defined as difference between ratings received and one's own expectation of such ratings, was studied in 385 pupils, Grades 5-12. General level of estimating was found unrelated to general level of ratings received. Increased accuracy was generally related to higher grade level. Both sexes were found more accurate in perceiving ratings made of them by opposite sex than by same sex.—*E. B. Page.*

8242. Dix, Dorothy M. (U. Toronto School Nursing) **Role playing in nursing education in the psychiatric field.** *Group Psychother.*, 1962, 15(3), 231-235.—Role playing and the discussion following such sessions are valuable in allowing students to gain insights into their behavior.—*I. W. Kidorf.*

8243. Gold, Hilary A. (Brooklyn Coll.) **The classroom isolate: An additional dimension for consideration in the evaluation of a quality education program.** *J. exp. Educ.*, 1962, 31(1), 77-80.—For 30 classrooms, percentage of students "isolates" was found correlating significantly (.63) with F scores for "authoritarianism" in the teachers. Author argues a causal relationship.—*E. B. Page.*

8244. Keogh, Jack. (U. California, Los Angeles) **Extreme attitudes toward physical education.** *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Rec.*, 1963, 34(1), 27-33.—The purpose of this study was to analyze stated attitude responses and selected descriptive information in relation to 2 groups of men and women who demonstrated extreme attitudes toward physical education. From an original group of 266 Ss, 69 men and women were selected whose scores on the Wear Physical Education Attitude Inventory were extremes of high or low. Additional data were obtained through a group interview questionnaire. There were no male-female differences within the extreme groups. The low groups offered some minimum support for the outcomes of physical education, but they vigorously questioned the relative value of physical education as a school program. There was no evidence to indicate that negative attitudes were related to non-participation.—*Journal abstract.*

8245. Rao, N. A. Hanumantha. **The application of the order of merit and paired comparison methods to study the preferential values of undergraduate students.** *J. Karnatak U.*, 1962, 6, 137-142.—239 college students rank ordered and compared in pairs 10 universal values. Students in general assigned the first 3 ranks to truth, honesty, and wisdom and the last 3 ranks to harmony, power, and wealth. No significant differences were found between sexes or between castes or between arts and science students. Boys appeared more consistent in assigning ranks.—*U. Pareek.*

8246. Shukla, Ramapati. (Banaras Hindu U., Varanasi, India) **Factors governing the choice of studies.** *Shiksha*, 1962, 14(4), 88-97.—Replies to a questionnaire from 900 graduates and undergraduates showed that in high schools the parents influence

selection of subjects, whereas at the masters' level "own fancy" is the most important reason, followed by "obtained good marks" in the last examination. Teachers' advice does not play an important part. At the bachelor's level many students select subjects because they are considered easy.—*U. Pareek.*

8247. Siegel, Alberta Engvall, & Curtis, Elizabeth Ann. (Pennsylvania State U.) **Familial correlates of orientation toward future employment among college women.** *J. educ. Psychol.*, 1963, 54(1), 33-37.—Informant obtained from individual interviews with 43 young women, a random sample from the population of sophomore women on the campus of a large university, was coded by 2 independent scalars to yield measures of the work orientation of the Ss and 5 characteristics of their families: socioeconomic status, parents' educational level, mother's work orientation, parents' views on purpose of college, and parents' attitudes toward importance of education for the daughter. Only 1 of these latter characteristics—mother's work orientation—was found to be significantly correlated with work orientation in Ss. Most Ss stated they intended to marry and to work. The homogeneity of the sample may have operated to depress observed correlations.—*Journal abstract.*

8248. Stern, George G. (Syracuse U.) **Characteristics of the intellectual climate in college environments.** *Harv. educ. Rev.*, 1963, 33(1), 5-41.—1076 students located in 23 colleges were given 2 questionnaires (the Activities Index and the College Characteristics Index), developed by the author and his associates to measure various needs and press. The ensuing factor analyses were used to shed some light on the relationships obtaining between the psychological environments of these colleges and their organization and administration. Schools characterized by "high" and "low" intellectual climates respectively were compared and contrasted in terms of the institutions themselves and the natures of the student bodies. Inferences and suggestions for further investigations were made. (51 ref.)—*C. M. Franks.*

8249. von Harnack, Gustav-Adolf. (Märtnistr. 52, Hamburg, Germany) **Das Schulversagen als ärztliches Problem.** [Failure in school as a medical problem.] *Z. Psychother. med. Psychol.*, 1962, 12(3), 102-111.—In dealing with children having difficulties in school, various aspects have to be investigated: Is the child in the appropriate school? Is the child's mental capacity as determined by the differentiated intelligence test adequate to cope with demands put on him? How is the teacher-pupil relation? Are changes in the family relations advisable? Advice concerning life habits, work, and leisure time may be given or at least discussed with parents who may be rigid in their ambitions. Medical problems have to be dealt with adequately—i.e., tics, enuresis, restlessness, seurocirculatory dystonia, poor concentration power, vegetative lability—not to speak of serious conditions including asthma, diabetes, and brain damage.—*I. Neufeld.*

8250. Willits, Fern K., & Bealer, Robert C. (Pennsylvania State U.) **The utility of residence for differentiating social conservatism in rural youth.** *Rural Sociol.*, 1963, 28(1), 70-80.—2807 Pennsylvania high school sophomores in 1959-60 had less traditional attitudes toward selected aspects of

social behavior than those questioned in 1946-47. Rurality-urbanity of residence still affected the replies.—H. K. Moore.

SPECIAL EDUCATION

8251. Falck, Frank J., & Falck, Vilma T. (DeGoesbriand Memorial Hosp., Burlington, Vt.) Disorders of neurological integrative mechanisms: A rationale for the expansion of our professional scope. *ASHA*, 1962, 4(12), 439-440.—Inadequate attention has been paid by the field of speech pathology and audiology to the communicative and nonoral disturbances such as reading, writing, spelling, calculation, etc., which seem to be symptoms of disorder and integrative mechanisms. A proper share of the training curriculum should be devoted to theoretical and practical considerations of these disabilities, and the profession should become aware of the opportunities which exist within this expanded concept.—M. F. Palmer.

8252. Sokolianskii, I. A., & Meshcherniakov, A. I. (Eds.) *Obuchenie i vospitanie slepoglukhonemykh*. [Teaching and training of blind deaf-mutes.] *Izv. Akad. Pedag. Nauk RSFSR*, 1962, No. 121. 197 p.—These transactions of the Institute of Defectology are devoted to reports on the teaching of blind deaf-mutes, aspects of their development, and formation of their concepts and perceptions. There is included an article on the late Ivan A. Sokolianskii, known for his work in the teaching and training of defective children.—I. D. London.

Reading

8253. Leton, D. A. (U. California, Los Angeles) Visual-motor capacities and ocular efficiency in reading. *Percept. mot. Skills*, 1962, 15(2), 407-432.—There was an indication that reading disability cases—and particularly those with perceptual retardation—were more deficient in graphomotor and oculomotor skills than were the normal readers. Inasmuch as neuromuscular functions and substructure play a major role in the development of these visual motor skills, further clinical studies of children in preschool and beginning reading stages are indicated. Such studies should be of value, not only for the prediction of learning difficulty, but also for a basic understanding of the maturation of visual-motor capacities and their relationship to reading development. (74-item bibliogr.)—W. H. Guertin.

8254. Walters, Richard H., & Kosowski, Irene. (U. Toronto) Symbolic learning and reading retardation. *J. consult. Psychol.*, 1963, 27(1), 75-82.—It was predicted that advanced, average, and retarded readers would also be advanced, average, and retarded in both the number of trials required to master symbolic learning tasks and in their response latencies to visual and auditory symbols. Some confirmation of the prediction was obtained, but both the provision of a reward and the effect of practice increased the efficiency of retarded readers, especially on the auditory task. The data were interpreted as suggesting that retarded readers need an incentive in relatively difficult learning situations and also that, unless highly motivated, retarded readers tend to be less attentive to stimuli. It was further suggested that difficulties in

symbolic learning may be, in part, a function of reduced ability to attend to stimuli.—*Journal abstract.*

Mental Retardation
Gifted Students

8255. Baldwin, J. W. (Santa Rosa, Calif.) The relationship between teacher-judged giftedness, a group intelligence test and an individual intelligence test with possible gifted kindergarten pupils. *Gifted Child Quart.*, 1962, 6(4), 153-156.—100 children registered in 22 different kindergarten classes served as Ss. Their teachers were asked to make judgments of giftedness after 6 weeks of class and again after 7 mo. of class. No definition of giftedness was given to the teachers. Stanford Binet, Form L-M, and California Test of Mental Maturity (CTMM) were administered to the children. Using a Binet IQ of 130 as the criterion for giftedness it was found that the teacher's 1st judgment agreed with it in 26% of the cases. That teacher's 2nd judgment agreed with it in 38% of the cases and CTMM agreed with it in 39% of the cases. The lack of teacher agreement with the criterion raised a question about her ability to identify gifted children. (6 ref.)—N. M. Chansky.

8256. Grace, Harry A., & Lewellyn, Louis W. (Alameda State Coll., Hayward, Calif.) The gifted child in a sociology of knowledge. *J. educ. Sociol.*, 1963, 36(7), 325-334.—"The goal of education must be to wed information with practice. These qualities are already apparent in the gifted child. As teachers, we keep the gate which youth must pass to enter adulthood. Too often the price of passage is the suppression, loss or diversion of youth's priceless gift: effective intelligence."—H. K. Moore.

8257. Kennedy, Wallace A., & Smith, Alvin H. (Florida State U.) A high performance MMPI scale for adolescents. *Psychol. Rep.*, 1962, 11(2), 494.—A description of preliminary results and planned research toward the development of a scale for selection of gifted adolescents.—B. J. House.

8258. Krause, I. B., Jr. Some attributes, aptitudes, and interests of the gifted. *Gifted Child Quart.*, 1962, 6(4), 139, 140, 149.—A segment of an 8-yr. study of superior students in the southeast is reported. The writer points out that gifted students drop their deep interest in philosophy by the time they enter college. Increases in curricular offerings for superior college students during the 8-yr. period were noted in all subject areas. Increases were highest for English, Natural Science, Mathematics, and lowest for Social Science. Availability of financial aid for the natural sciences was suggested as the reason for the increase in offerings in these areas.—N. M. Chansky.

EDUCATIONAL GUIDANCE

8259. Cassell, Russell N. Comparing IBM card and hand scoring pad administration of the Kuder Preference Record. *Calif. J. educ. Res.*, 1963, 14(1), 31-35.—536 9th-grade pupils were given the Kuder, using machine-scorable cards. A month later, 200 of these pupils were given the hand-scorable Kuder. X^2 analysis of the 2 sets of data on the 10 scales revealed no statistically significant differences, taken as evidence of adequate reliability. 178 of the

536 initial records were of doubtful validity, using Kuder criteria and 49 of the 200 retest records were so regarded, evidencing a difference statistically significant at the .05 level. Analysis of the 49 nonvalid records among the 200 retested, showed that the nonvalid pupils scored significantly lower than their 141 classmates in CTMM IQ, and in Iowa Test of Educational Development scores in Reading, General Vocabulary, Basic Social Studie, and Use of Information Sources.—*T. E. Newland.*

8260. Dauber, Moshe. Yeüts psikhologi legomrey kita 8. [Psychological counseling to leavers of 8th grade.] In Moshe Avigal & Uri Blum (Eds.), *Madrikh lekhitot 7-8. [Guide to Grades 7-8.]* Tel Aviv, Israel: Tarbut Vehinukh, 1962. Pp. 29-38.—The oneness of purely psychotechnical and psychotherapeutic approach to counseling is stressed, and the thesis explained that "the final aim of vocational guidance is to adjust the adolescent child to a vocation or to acquiring a vocation." This process lasts some years, and choosing a vocational career is its last step. Maturity in choosing a vocation, vocational interest, and ways to study aptitudes are explained. The teacher's rôle within the framework of vocational guidance is discussed.—*H. Ormian.*

8261. Dave, Indu. (Vidyabawan Teachers Coll., Udaipur, India) **The psychological foundations of guidance.** *Shiksha*, 1961, 14(2), 90-101.—There is a high interaction between guidance and psychology. The main foundations of guidance are the study of personality, psychology of individual adjustment, and objective assessment through tests. Testing is a useful tool in guidance. Some applications of psychological tests are discussed.—*U. Pareek.*

8262. Goffart, J. M., & Minon, P. F. Une approche d'un quotient de maturité vocationnelle: Analyse des données. [An approach to a quotient of vocational maturity, analysis of data.] *Bull. Psychol. scol. Orient.*, 1962, 11, 123-134.—The quotient of vocational maturity takes into account age, intelligence, level of aspiration of the child and of the parents, and vocational choice suitable to the social environment and to the wishes of the parents.—*R. Piret.*

8263. Landy, Edward, & Palmer, John C. **Guidance in the public schools.** Boston, Mass.: Massachusetts Council Public Schools, 1962. 24 p.—A revision of a pamphlet first published in 1956.

8264. Lavianne, A. **Premier bilan des tests de connaissances utilisés en tutelle psychologique.** [First inventory of educational tests used in psychological guidance.] *Bull. Psychol. scol. Orient.*, 1962, 11, 57-67.—A list of educational tests for primary and secondary schools, used in the Belgian Catholic "psycho-medico-social centres."—*R. Piret.*

Rosenzweig, Mark R., & Menahem, Ruth. **Age, sexe et niveau d'instruction comme facteurs déterminants dans les associations de mots.** [Age, sex and level of instruction as determining factors in word association.] *Année psychol.*, 1962, 62(1), 45-61.—Responses to words by similar parts of speech increase with school grade and with educational level, but show no sex differences either among children or adults.—*G. Rubin-Rabson.*

8273. Ross, Leslie W. (Board Educational Finance, Santa Fe, N. M.) **Follow-up study of 1960 New Mexico high school graduates.** *N. Mex. Soc.*

Stud. Educ. educ. res. Bull., 1963 (Mar), 1-4.—Approximately $\frac{1}{2}$ of New Mexico's 8900 high school graduates enrolled in a college; most of them in New Mexico. On the basis of questionnaire returns from $\frac{1}{2}$ of this group, the students who ranked highest on the pregraduation predictors of academic success were, in general, in the best academic position after their 1st college year.—*J. G. Cooper.*

8274. Safran, C. (Alberta Public Schools, Canada) **An introduction to the Safran Culture Reduced Intelligence Test and some reports on its validity from current studies.** *Alberta J. educ. Res.*, 1963, 9(1), 36-44.—The Safran Culture Reduced Intelligence Test is described, and validity and reliability data are reported. It is stated that "the test appears to be a reasonably good measure of potential for those children from different cultures, or lower socioeconomic strata."—*R. F. Allen.*

8275. Savage, R. D. (U. New England, Australia) **Personality factors and academic performance.** *Brit. J. educ. Psychol.*, 1962, 32(3), 251-253.—168 male and female 1st-year university students completed the Maudsley Personality Inventory. Mean neuroticism and extraversion were higher than the norms. High scores on both factors were negatively related to academic performance as measured by number of passes on the annual examinations.—*B. T. Jensen.*

8276. Welck, A. A. (U. New Mexico) **The New Mexico high school statewide tests and academic success at the University of New Mexico.** *N. Mex. Soc. Stud. Educ. educ. res. Bull.*, 1963 (Mar), 31-35.—"The rank obtained by combining the scores of both SCAT and STEP do a superlative job of predicting success at this university."—*J. G. Cooper.*

8277. Young, D. (Barnsley Education Committee) **Examining essays for eleven plus classification.** *Brit. J. educ. Psychol.*, 1962, 32(3), 267-274.—Some of the weaknesses of usual essay marking procedures are discussed and splitting essays by sex and title into small batches suggested, using tables which impose a normal distribution. Data are presented to indicate that addition of the "allocated essay" marks does not detract from the validity of the examination based upon objective tests.—*B. T. Jensen.*

Aptitudes

8278. Humphreys, Lloyd G. **Hierarchical factors in course grades in an Aviation High School.** *USAF PRL tech. docum. Rep.*, 1962, No. 62-23, 10 p.—Factor scores of high school grades were needed for use in a later study of the relationship of Air Force aptitude tests to high school achievement. Separate hierarchical analyses were made for course grades in the technical curriculum and in the mechanical curriculum. A large general factor characterized both solutions, probably reflecting general academic ability. Other factors displayed the expected subject matter groupings, the most significant being a clear-cut shop factor which appeared in both analyses.—*USAF PRL.*

8279. Springob, H. K., & Jackson, C. W. **Measure of abilities and inventoried interests of ninth grade boys.** *Voc. Guid. Quart.*, 1963, 11(1), 37-40.—Results reported were based on a final group of 71 9th-grade boys in a New Jersey school for whom

complete tests results were available (DAT, Kuder Preference Record, Form C, with V-scores within acceptable limits; Otis Beta IQ). The usual findings of low but positive *rs* between matched aptitudes and interests are seen. 2 unexpected results are reported: $-.026$ between DAT Verbal and Kuder Persuasive and $-.595$ between DAT Abstract and Kuder Musical. "Longitudinal studies of interest-ability relationships are desirable."—*W. L. Barnette, Jr.*

8280. Stake, Robert E. (U. Nebraska) **A non-mathematical quantitative aptitude test for the graduate level: The QED.** *J. exp. Educ.*, 1962, 31(1), 81-83.—"The Quantitative Evaluative Device was developed to predict successful pursuit of the graduate college objectives which involve quantitative transactions. The test has been revised in accordance with generally accepted techniques." Evidence of its reasonable predictive and concurrent validity is presented.—*E. B. Page.*

Achievement

8281. Andersen, L. Bryce, & Spencer, Patricia A. (U. Minnesota) **Personal adjustment and academic predictability among college freshmen.** *J. appl. Psychol.*, 1963, 47(2), 97-100.—The objective of this study was to investigate whether the prediction of academic achievement is influenced by personal emotional adjustment as found by Hoyt and Norman in 1954. Samples consisted of 1,465 arts college freshmen from which were selected three "adjustment" groups (normal, one-peak, and maladjusted) according to arbitrary cut-off points on the clinical scale of the MMPI. Correlations between grade point average (GPA) and predictor variables were determined. For the arts college, no significant differences were found between the adjustment groups for the correlation of GPA with either of the predictors high school rank or the Minnesota Scholastic Aptitude Test. 11 predictor variables were used for the engineering freshmen, only one of which yielded statistically significant differences between the adjustment groups. In contrast to the findings of Hoyt and Norman, it was concluded that the prediction of academic achievement is not influenced by personal adjustment.—*Journal abstract.*

8282. Finger, John A., & Schlessner, George E. (Brown U.) **Academic performance of public and private school students.** *J. educ. Psychol.*, 1963, 54(2), 118-122.—Public school students are reported to obtain higher college grades than private school students. Equating on scholastic aptitude is reported to leave a difference favoring the public school student. The Personal Values Inventory, a test measuring non-intellectual factors in school success, was administered to an entering college class. 216 had attended public school and 97 private school. When grades were regressed for the Scholastic Aptitude Test, Verbal and Mathematical; the Ohio State Psychological Examination; and the Personal Values Inventory, the group means did not differ significantly. Regressing for these factors randomly distribute grades among private and public school students. A second sample showed similar results for the group means. The conclusion is that private school students do less well because as a group they are lower in scholastic aptitude and in motivation.—*Journal abstract.*

8283. Gustav, Alice. (New York U.) **Comparison of college grades and self-concept.** *Psychol. Rep.*, 1962, 11(2), 601-602.—"It was not found possible to differentiate, on the basis of responses to the 'Who am I?' Test, among college students who had superior, average, or failing grades [$N = 160$]."—B. J. House.

8284. Teahan, John E. (U. Wisconsin-Milwaukee) **Parental attitudes and college success.** *J. educ. Psychol.*, 1963, 54(2), 104-109.—Though highly successful academically in high school, $\frac{1}{2}$ of the student Ss of this study (46 males and 44 females) did poorly during their 1st year of college. Although no differences were found in the child rearing attitudes of the students themselves, compared to their daughters the mothers of low achieving girls had stronger attitudes relating to domination and the use of discipline ($p < .01$). In the case of low male achievers, the disparity was primarily between father and son, fathers being more possessive and dominating ($p < .05$). It is suggested that insufficient development in self-sufficiency and independence handicapped the underachievers.—*Journal abstract.*

8285. Vliet, W. Van. **The validity of school marks.** *Shiksha*, 1962, 15(2), 56-68.—A more rational method of assigning marks is classificatory marking by teachers. 2 things to be decided by each teacher are: the number of subclasses and the mark to be assigned to the highest subclass. The classificatory method is explained.—U. Pareek.

EDUCATIONAL PERSONNEL

8286. Anderson, C. C., & Hunka, S. M. (U. Alberta) **Teacher evaluation: Some problems and a proposal.** *Harv. educ. Rev.*, 1963, 33(1), 74-95.—The psychology of the learning process and the statistical techniques of multivariate analysis were applied to the problems of teacher evaluation. Experimental tests of the resulting model are suggested. (120 ref.)—C. M. Franks.

8287. Fielstra, Clarence. (U. California, Los Angeles) **Discriminative and predictive values of ratings given to UCLA student teachers on the secondary school level.** *Calif. J. educ. Res.*, 1963, 14(1), 11-18.—Out of 200 student teachers rated on the UCLA rating form (32 characteristics), the top 50 and bottom 50 students were identified and rated, on the same device, by their principals after one year of teaching. "Ratings given to (them) have statistically significant value in predicting subsequent first-year teaching success. Ratings given to (them) on each of the 32 characteristics are more discriminative between 'excellence' and 'goodness' than are subsequent ratings given them by principals at the conclusion of their first year of teaching." UCLA rating on "scholarship" were more discriminative than are ratings on "personal qualities." The reverse was found to be true with respect to the principals' ratings.—T. E. Newland.

8288. Isaacson, Robert L., McKeachie, Wilbert J., & Milholland, John E. (U. Michigan) **Correlation of teacher personality variables and student ratings.** *J. educ. Psychol.*, 1963, 54(2), 110-117.—A peer group nomination procedure, a descriptive adjective inventory, and the IPAT 16 PF Questionnaire were administered to 2 groups of teaching fel-

lows in the introductory psychology course at the University of Michigan. These personality scores were related to the teaching fellows' teaching effectiveness ratings made by their students and to the factor scores obtained from factor analyses of the separate items of the student rating instrument. The teacher personality variable most consistently correlated with good ratings by students was the peer group evaluation of the teaching fellows' "general cultural attainment." The relations of the personality scales to the other dimensions of student ratings are also presented. (17 ref.)—*Journal abstract.*

8289. Reichenberg-Hackett, Wally. (Duke U.) **Scoring teacher behavior in nursery groups.** *Psychol. Rep.*, 1962, 11(2), 600.—A report that a detailed account of scoring methods described in a previous experiment is now available from the American Documentation Institute.—B. J. House.

8290. Rudd, W. G. A., & Wiseman, S. (U. Manchester, England) **Sources of dissatisfaction among a group of teachers.** *Brit. J. educ. Psychol.*, 1962, 32(3), 275-291.—590 teachers (about 72%), completing training at the University of Manchester in 1955, were queried. The majority had experienced satisfaction in teaching (more in infant and grammar schools). Sources of dissatisfaction are described and discussed.—B. T. Jensen.

8291. Taylor, P. H. (U. Leicester, England) **Children's evaluations of the characteristics of the good teacher.** *Brit. J. educ. Psychol.*, 1962, 32(3), 258-266.—897 children completed checklists based upon statements made about teachers written by 1379 pupils. Analysis of each of 5 scales is discussed.—B. T. Jensen.

8292. Wallen, Norman E., Travers, Robert M. W., Reid, Ian E., & Wodtke, Kenneth H. (U. Utah) **Relationships between teacher needs and teacher behavior in the classroom.** *J. educ. Psychol.*, 1963, 54(1), 23-32.—2 samples of elementary school teachers ($N = 77$ and 41) were studied with respect to consistencies between classroom behavior and "needs" as measured by a paper-and-pencil questionnaire. The paper-and-pencil device provided scores on Achievement, Affiliation, Recognition, and Control needs. Behavioral data consisted of observations recorded as ratings and also as Q sorts and an analysis of verbal statements made by the teachers. The principal findings were: (a) significant positive relationships among the various measures of teacher behavior on the Control and Affiliation dimensions, (b) a significant negative relationship between Control and Affiliation behavior as viewed by the observers, and (c) significant positive correlations (.30-.50) between Control need as measured by the questionnaire and controlling behavior of the teachers.—*Journal abstract.*

8293. Wattenberg, William W. (Wayne State U.) **Evidence and the problems of teacher education.** *Teachers Coll. Rec.*, 1963, 64(5), 374-380.—Issues are raised on: "How to eliminate the lag between discovery and field application, and how to base the development of our teacher-education programs on scientifically determined facts as to what a teacher does, what in teachers makes a difference to children, and how teachers can be developed with the optimum of those attributes which genuinely make a difference in actual classrooms." We need "multi-

discipline, large scale searches for basic principles and for their applications."—*H. K. Moore.*

8294. Willey, Darrell S., McComas, James D., & Miller, Luit K. (New Mexico State U.) A suggested research model for the investigation of classroom teacher effectiveness. *N. Mex. Soc. Stud. Educ. educ. res. Bull.*, 1963 (Mar), 19-25.—A schematic adaptation of Halpin's paradigm showing how 41 variables can be utilized in studying teacher effectiveness.—*J. G. Cooper.*

INDUSTRIAL & MILITARY PSYCHOLOGY

8295. Barbour, A. B., & Whittingham, H. E. (Eds.) (British-European Airways, London, England) **Human problems of supersonic and hypersonic flight.** London, England: Pergamon, 1962. xvii, 592 p. \$20.00.—This book reproduces the papers presented at the 5th European Congress of Aviation Medicine held in London from August 29 to September 2, 1960. 5 general areas are covered: (a) flying personnel research, (b) human efficiency related to flight performance and operational procedures, (c) human efficiency related to airborne systems, (d) flight environment and safety, and (e) human efficiency related to ground control systems. A section of miscellaneous papers is also included. Each individual paper is preceded by English and French summaries.—*S. L. Freud.*

8296. Thomas, L. Jean. (Ed.) **A bibliography of reports issued by the Behavioral Sciences Laboratory: Engineering psychology, training psychology, environmental stress, simulation techniques and physical anthropology.** Wright-Patterson Air Force Base, O.: 6570th Aerospace Medical Research Laboratories, Behavioral Sciences Laboratory, 1962. 78 p.—"This bibliography lists, by functional groupings, the technical reports, technical notes, contractor reports, memorandum reports, and journal articles prepared by the Behavioral Sciences Laboratory, and its contractors, from 1945 through 1961."—*USAF AMRL BSL.*

VOCATIONAL GUIDANCE & APTITUDES

8297. Campbell, David. (U. Minnesota) **Change on SVIB: Dice or men?** *J. appl. Psychol.*, 1963, 47(2), 127-129.—The profile report form for the Strong Vocational Interest Blank has shaded areas, established by throwing dice, to indicate chance scores on the various scales. The SVIB manual suggests that this shaded area be used as a reference point to determine if a given score is significant. This article suggests that the shaded areas should be determined by scores of the Men-in-General group instead of throwing dice. The effect of this on the shaded area is shown on a sample profile report form.—*Journal abstract.*

8298. Parker, H. J. **29,000 Seventh graders have made occupational choices.** *Voc. Guid. Quart.*, 1963, 11(1), 54-55.—373 Oklahoma public schools were involved and 29,000 students (66% of all 7th graders) were surveyed concerning educational and vocational plans. The data show that these students believe they have made reasonable firm plans for their occupational future (66% indicated definite plans). Less than 10% of the group described themselves as

without any occupational goal. Should this be a general finding, a program of vocational exploration should be started at this early stage.—*W. L. Barnette, Jr.*

8299. Rusalew, Herbert. (Hunter Coll.) **The floundering period in the late careers of older disabled workers.** *Rehabilit. Lit.*, 1963, 24(2), 34-40.—The older disabled worker goes through a period of floundering in his work history similar to the young worker seeking his role in the world of work. The older disabled worker often finds himself unable to return to his previous stable position, and so becomes involved in short-term jobs which force a re-evaluation of the vocational self-concept. Characteristic of this period is mobility which is vertically downward, and horizontally toward clerical or service occupations. Services needed are: (a) An ongoing counseling service, (b) an ongoing placement service, and (c) a disengagement workshop designed to give opportunities for gradual work reduction. (26 ref.)—*W. D. Kerr.*

8300. Strong, Edward K. (Stanford U.) **Reworded versus new interest items.** *J. appl. Psychol.*, 1963, 47(2), 111-116.—In revising the SVIB, 49 items were reworded and 101 items were replaced by new ones. The change in content between the original and reworded items was judged too slight to affect scoring of these items using current weights. The change in content between the original items and new items was judged too significant to allow these items to be scored on existing scales using current weights. To determine whether these judgments were correct, control and experimental groups responded to the items in a test-retest situation with a 3-day interval. 3 measures of stability agreed very well but not perfectly. An average of the 3 procedures indicated that 10 of the 49 reworded items should be classified as new instead of reworded. The criterion, stability of items, is a useful one in the selection of new items.—*Journal abstract.*

OCCUPATIONAL & CAREER INFORMATION

8301. Ladinsky, J. (U. Wisconsin) **Careers of lawyers, law practice and legal institutions.** *Amer. sociol. Rev.*, 1963, 28(1), 47-54.—"A sample of 207 stable metropolitan lawyers evenly divided among individual and medium-to-large firm practices is analyzed for relationships between background and type of law practice. Data reveal that solo lawyers more often come from minority religious-ethnic, entrepreneurial, and working-class homes, have inferior educations, and experience chaotic work histories. Causal analysis establishes that religious and socioeconomic origins are independent background factors. These findings are interpreted in terms of the processes and effects of self-selection and recruitment in the allocation of the lawyer labor supply to work settings. The importance of the social composition of the recruitment base for legal practice and the law is explored. It is suggested that background characteristics give rise to career contingencies that impose a number of important constraints on the operation of legal institutions."—*L. Berkowitz.*

8302. Madden, Joseph M., & Bourdon, Roger D. **Effects on judgment of variations in rating scale format.** *USAF PRL tech. docum. Rep.*, 1963, No.

63-2. iii, 16 p.—The purpose of this study was to determine whether mean job evaluation ratings would differ as a function of 7 variations in rating scale format. 60 basic airmen rated 15 occupations on 9 job requirement factors for each format. A 3-way analysis of variance (jobs, factors, scale format) resulted in statistically significant terms for each of the main effects and for all 4 interaction terms. It was concluded that rating scale format was a determinant of the judgment of raters in this sample and that selection of an optimal format should be based upon capability to predict a criterion.—*USAF PRL*.

8303. Ruth, Roger A. Readability of occupational materials. *Voc. Guid. Quart.*, 1963, 11(1), 7-10.—The Farr-Jenkins-Paterson simplification of the 1948 Flesch reading ease index was applied to the total content of the 1959 Career Information Kit Supplement (85 SRA Occupational Briefs and 35 items from other sources). The mean grade level rating was 14.7. The SRA materials used simpler vocabulary but tended to over-long sentences; they are, however, more consistent in readability level than items written by public relations people. The reading level of all of these materials is too high to serve as incidental reading material for most high school students.—*W. L. Barnette, Jr.*

8304. Shuval, Judith T. Perceived role components of nursing in Israel. *Amer. sociol. Rev.*, 1963, 28(1), 37-46.—"This paper explores the dominant sources of recruitment for the nursing profession in Israel. The relatively high status position of the nursing profession among the non-academic women's occupations in Israel has served to attract girls from lower-class origins, especially immigrant girls to whom alternative avenues of mobility may be less available. A second problem concerns the differential perception of the nursing role by different types of potential recruits. We identify two dominant role components of the professional nurse: the 'affective' role component and the 'scientific-technical' role component. Among immigrant girls who are attracted to nursing, those from lower-class origins tend to emphasize the 'affective' role component, while those from upper-class origins are more likely to place an emphasis on the 'scientific-technical' aspects of the profession."—*L. Berkowitz*.

SELECTION, PLACEMENT, APPRAISAL

8305. Ambler, Rosalie K. Selection procedures for non-pilot naval aviation officers. *USN Sch. Aviat. Med. res. Rep.*, 1963, Proj. MR005.13-3003, Subtask 1, Rep. No. 36. ii, 10 p.—This study developed an optimal method of selection for the Navy's nonpilot aviation officer program. Use of minimums on the Aviation Qualification Test and mathematics portion of that test was demonstrated as the most reasonable procedure among the alternatives investigated. The Flight Aptitude Rating contributed slightly to validity, but its use was questioned because of the increased number who would be rejected thereby. Other quantitative tests added statistical significance to the Navy's Aviation Selection Tests in predicting performance in Basic NAO training; however, on practical grounds, this significance was considered to be of insufficient magnitude to justify their use.—*USN SAM*.

8306. Elliott, L. L. Hearing of Air Force pilots: 1955 to 1962. *USAF SAM tech. docum. Rep.*, 1962, No. 62-127. 6 p.—The author compared records for all pilots tested by the School of Aerospace Medicine Audiology Laboratory from 1955 through mid-April 1962. When compared by age groups with Ss reported in 2 civilian studies, pilots are found to have relatively good hearing.—*M. C. Payne, Jr.*

8307. Ford, Frank B. A technique for the evaluation of recruiting strategy with fluctuating availability and known demand. *USAF PRL tech. docum. Rep.*, 1962, No. 62-22. 17 p.—Large organizations, such as the armed services, have a fairly constant requirement for new personnel, but availability of recruits varies from month to month. It is proposed that manpower needs be met by exceeding quotas at times of high availability of qualified applicants and holding surpluses inactive until needed. A special case of the general linear programming model, the "transportation problem," provides a computer technique for determining the optimal scheduling of overages and holding times to keep holding costs at a minimum. Different arbitrary estimates of holding costs applied to a series of problems demonstrate the importance of accurate cost estimates. Procedures for continuing improvement of input data are suggested.—*USAF PRL*.

8308. Forehand, Garlie A. (U. Chicago) Assessments of innovative behavior: Partial criteria for the assessment of executive performance. *J. appl. Psychol.*, 1963, 47(3), 206-213.—Assessments by superiors and peers of the innovative behavior of administrators are considered as partial criteria of executive performance. A measure based upon 7-point rating scales was adjudged unacceptable as a measure of innovative behavior, because of insufficient discriminant validity with respect to ratings of other attributes, and because of uniformly high correlation with ratings of general effectiveness, regardless of raters' independently expressed attitudes toward innovative behavior. A measure based upon forced-choice between innovative and noninnovative descriptions shows more promise; its major correlates both within and across raters are other measures of innovation and of attributes theoretically related to innovativeness; and it is significantly correlated with general effectiveness ratings only when assessors report, by an independent measure, that they value innovative behavior highly. Assessments are influenced by status of assessor (supervisor or peer) and by organizational climates. (19 ref.)—*Journal abstract*.

8309. Hill, T. Gardner. (Glen Head, N. Y.) Performance rating of technical personnel. *Advanc. Mgmt.-Off. Exec.*, 1963, 2(1), 22-25.—A method of rating through the use of specially ruled forms to minimize bias due to "the ideal man image" and/or personality compatibility between rater and rated.—*E. Q. Miller*.

8310. Johnson, Donald M. (Michigan State U.) Reanalysis of experimental halo effects. *J. appl. Psychol.*, 1963, 47(1), 46-47.—Data on ratings of individuals, obtained under 2 conditions of judgment and published in 1956, were reanalyzed by a more complete analysis of variance. The usual interaction between raters and individuals, called a halo effect, was found but it was not influenced by judgment conditions intended to maximize it. Hence, the evidence

for halo effect due to judging operations remains questionable.—*Journal abstract.*

8311. Kirchner, Wayne K., & Mousley, Nancy M. (Minnesota Mining Manufacturing Co., St. Paul) A note on job performance: Differences between respondent and nonrespondent salesmen to an attitude survey. *J. appl. Psychol.*, 1963, 47(3), 223-224.—Salesmen respondents (N=72) and nonrespondents (N=19) to a mail attitude questionnaire were compared in terms of 2 objective measures of performance: net sales points and net total points. Mean scores on both measures were significantly higher for respondents than for nonrespondents. These results tended to follow results of other studies in nonindustrial settings that suggested volunteers or respondents are, in general, "better" persons in terms of such variables as motivation, personality and, in this case, job performance.—*Journal abstract.*

8312. Lepkowski, J. Richard. Development of a forced-choice rating scale for engineer evaluation. *J. appl. Psychol.*, 1963, 47(2), 87-88.—A technique alternative to the conventional ratings of engineers by their supervisors was studied. A 20-triad forced-choice rating scale was constructed. 33 engineers were rated by their supervisors using this device. The reliability of these ratings was .90. An item analysis showed 19 of the 20 triads to have strong discriminating power between high and low scorers. The same Ss were also rated in 8 different areas on a 4-point scale. The reliability of the 2nd rating scale was .87. The 2 scales correlated .73 with each other. These findings support previous research concerned with the more general applicability of the forced-choice technique for the determination of criterion scores.—*Journal abstract.*

8313. Lichtenstein, S., & Hahn, C. P. Feasibility of identifying predictors of success in officer jobs from personnel records and the Word Picture section of effectiveness reports. *USAF PRL tech. docum. Rep.*, 1962, No. 62-16. 62 p.—To increase the amount of information that can be used in determining desirable job requirements and in evaluating officer performance, 2 sources were examined for pertinent and scalable variables. From personnel records of officers in the communications specialty and the research and development career area, 76 variables were identified and scaled. By developing a method for content analysis, information from the Word Picture section of the Officer Effectiveness Reports for the same officers was quantified on 89 scales. Individual data records, score distributions, and intercorrelations of 165 variables for the 2 samples are available for use in developing qualifications and criteria for jobs in these areas.—*USAF PRL.*

8314. Mayo, G. Douglas, & Winiewicz, C. S. Prediction of success in AE(B) School from advancement in rating examination grades. Great Lakes, Ill.: United States Naval Training Center, Naval Examining Center, 1962. (CNATT P-201) 22 p.—"The study establishes that scores made on the appropriate Navy-wide Competitive Examinations for Advancement in Rating are useful in predicting the success of prospective students in the Advanced Aviation Electrician's Mate (AE"B") School. It indicates, further, that examinations for advancement to AE2, AE1, or AEC may be combined effectively with Navy Basic Test Battery scores (the

Navy Arithmetic Test, ARI, score in particular) to predict success in the AE"B" School."—C. T. Morgan.

8315. Perkins, Edward A., Jr., & Wiper, Robert E. (Washington State U.) Selecting the best stenographer. *Advanc. Mgmt.-Off. Exec.*, 1962, 1(11), 18-21.—Typing tests should be graded on syllabic intensity; stroke intensity; common words; doubled-letter words; right-hand words; left-hand words; and combined double, left-hand, and right-hand words if the tests are to be useful. Company dictating rates should be measured, and copy should be standardized for mailability as well as speed. In general the work situation should be validly represented in the test situation.—E. Q. Miller.

8316. Steininger, Konrad. (Inst. Flugmedizin, Hamburg, Germany) Psychologische Ursachen von Flugfehlern in der Ausbildung von Berufsfugzeugführern. [Psychological origins of flight-errors during flight instruction.] *Z. exp. angew. Psychol.*, 1962, 9(4), 667-700.—Flight errors that appear to the instructor as functional deficiencies of the trainee may be caused by multiple psychological problems. The study aims at a much more careful briefing of flight instructors in order to enable them to make a better evaluation.—W. J. Koppitz.

8317. Triandis, Harry C. (U. Illinois) Factors affecting employee selection in two cultures. *J. appl. Psychol.*, 1963, 47(2), 89-96.—4 samples—100 Illinois and 100 Greek students, 32 Illinois and 20 Greek personnel directors (PDs)—were asked to respond to a structured questionnaire which permitted the computation of the relative weights that would be given to various characteristics (competence, age, sex, race, religion, sociability, and wealth) by these people, if they were hiring employees for various levels of jobs in the accounting and finance department of a company. The responses of the 4 samples were similar. However, the American PDs gave more weight to race and the Greek PDs more weight to age than did the other samples. The students differed significantly from the PDs; in both cultures, the students gave larger weights to competence than did the personnel directors.—*Journal abstract.*

8318. Whitlock, Gerald H. (U. Tennessee) Application of the psychophysical law to performance evaluation. *J. appl. Psychol.*, 1963, 47(1), 15-23.—In the area of job performance, it was hypothesized that evaluations, e.g., "poor" to "excellent," were based on the observation of "performance specimens" where a performance specimen is defined as "an incident of relevant performance which at the time of observation was classed as uncommonly effective or uncommonly ineffective." It was further hypothesized that the psychophysical law ($y = kx^n$) would describe the relationship between the number of specimens observed (x) and resulting evaluations (y) of performance. Finally, it was hypothesized that Steven's criterion for prothetic continua would be satisfied—concave downward curve when ratio estimation scale values for sets of performance specimens are plotted against corresponding category scale values. Using simulated performance ratings as well as actual performance evaluations (performance ratings of apprentices, professors, supervisors, and executives) the above hypotheses appear to have been verified.—*Journal abstract.*

8319. Wright, Morgan W., Sisler, George C., & Chylinski, Joanne. (U. Manitoba) Personality factors in the selection of civilians for isolated northern stations. *J. appl. Psychol.*, 1963, 47(1), 24-29.—An investigation of personality characteristics associated with favorable adjustment to northern isolated living, and the usefulness of psychological tests in the selection of personnel for northern posting. 197 electronic technicians already screened on other psychological tests completed MMPI, Edwards Personal and Brainard Preference tests, and General Information and Arctic Interest questionnaires prior to 1 year of isolation duty on the mid-Canada Line. Adequacy of work and social adjustment was associated with 11 of 35 test variables and 3 of 26 questionnaire items. The discriminating function of the MMPI was reduced by the use of the K correction. It was suggested that despite the highly select nature of the sample used, the test battery has potential value in the selection of civilians to work in the far north.—(17 ref.)—*Journal abstract*.

TRAINING

8320. Anderson, Adolph V. Training, utilization, and proficiency of Navy Electronics Technicians: IV. Proficiency in mathematics. *USN Bur. Naval Personnel tech. Bull.*, 1962, No. 62-16. ii, 8 p.—"The fourth report in a series based on the results of a major survey of the training, utilization, and proficiency of Navy Electronics Technicians (ET's) which was conducted in the Pacific Fleet and the western United States during the first half of 1961. A Mathematical Achievement Test designed to measure basic abilities was developed and included in the survey. All of the items in the test were open-ended. Results tend to support the opinions of those who contend that ET's, in general, lack proficiency in mathematics. Mathematical Achievement Test scores were found to be related to school marks but not to any measure of ET job proficiency included in this study. It is concluded that no ET job performance requirement for greater mathematical capability has been revealed."—*N. Earl*.

8321. DeBurger, Robert A. The effects of practice on the performance of basic armor skills at night. *HumRRO res. Memo.*, 1962, Subtask Armornite VIII, Task 11-27. viii, 32 p.—10 basic tasks associated with the M48A2 tank were studied under varied illumination. Some require more night training than others. Simply assigning a proportion of night work to all tasks could produce deficiency in some and overtraining in others.—*R. Tyson*.

8322. Gonyea, George G., & Lunneborg, Clifford E. (U. Texas) A factor analytic study of perceived occupational similarity. *J. appl. Psychol.*, 1963, 47(3), 166-172.—Job perceptions and "occupational stereotypes" play leading roles in many current theories of occupational choice. Case II of Andrews' A-technique was used to explore the dimensions by which occupations are perceived. Factor analysis of perceived similarity among 22 occupational stimuli yielded results corresponding directly to 5 second-order factors obtained in an earlier study which had employed different Ss, a different procedure, and different occupational stimuli. Results also shed light on college students' perceptions of popular vocational

objectives and on the relationship between job perceptions and interest factors.—*Journal abstract*.

8323. Haggard, Donald F. Training methods for simulators of remote control human-guided missile systems: I. A comparative evaluation of component skill and total skill training exercises. *HumRRO res. Memo.*, 1962, Subtask Firepower VII, Task 11-26. ii, 29 p.—A study was designed "to determine the relative effectiveness of total task practice" in simulator training and to evaluate the advisability of further research. Results show that fractionation of the total task for effective S-55 simulator training is not required.—*R. Tyson*.

8324. Haggard, Donald F. The feasibility of developing a task classification structure for ordering training principles and training content. *HumRRO res. Memo.*, 1963. iv, 69 p.—The "subject of scientific systematics as it applies to the analysis and synthesis of behavior" is examined and analyzed in detail, "to determine whether some useful behavioral structure can be imposed upon the process of military training so that we can understand the process more fully and study it more meaningfully."—*R. Tyson*.

8325. Harding, Francis D., Downey, Robert L., Jr., & Bottenberg, Robert A. Career experiences of AFIT classes of 1955 and 1956. *USAF PRL tech. docum. Rep.*, 1963, No. 63-9. vi, 41 p.—To determine the utilization, attitudes, and retainability of officers who participate in Air Force Institute of Technology (AFIT) programs, a questionnaire survey was made of the 1955 and 1956 classes. Returns from 82% of the 1380 officers still in service and 62% of the 387 who had left it provided information about training, career experience, and attitude toward the Air Force. Responses showed that those apt to remain in service were older, married, regular officers. Younger officers who were ROTC graduates assigned to engineering and scientific fields were likely to leave the service. Most frequent reasons given for leaving the Air Force were: promotions not based on merit, better civilian job opportunities, low pay, and unsettled family life. Inservice officers' reasons for remaining were retirement advantages and amount of time already invested. They might decide to leave for a high-paying civilian job, loss of flight pay, or missing out on promotion. Nonmonetary aspects of the work situation were important determiners of job satisfaction. A Retention Potential Score, using information available before AFIT assignment, applied as a screening device would appreciably increase the retention of AFIT graduates.—*USAF PRL*.

8326. Kopstein, Felix F., Cave, Richard T., & Zachert, Virginia. Preliminary evaluation of a prototype automated technical training course. *USAF MRL tech. docum. Rep.*, 1962, No. 62-78. iv, 22 p.—This field study, conducted at Keesler Air Force Base, Mississippi, constituted a preliminary evaluation of intrinsic programming for automated training. Automated instructional materials used during the first 6 weeks of the Communications Electronics Principles course were presented to beginning electronic students via 35-mm. film on the AutoTutor Mark I, a rearview projection machine. Using the Keesler Mathematics Test, 3 groups—Experimental, Control, and Blind Control—were selected and matched from the middle ability range of each of 2 entering classes. The Experimental group received

via the machines all instruction normally received through lecture and discussion. However, they followed the usual method for their practical problems. The students using machines learned adequately from this experimental program. The interpretations of these results and implications for Air Force training are discussed. (17 ref.)—*USAF MRL*.

8327. Kurtzberg, Jerome M. (Burroughs Corp., Paoli, Pa.) **Dynamic task scheduling in flight simulators.** *USAF AMRL tech. docum. Rep.*, 1963, No. 63-17, iv, 45 p.—This report deals with the possible mechanization of dynamic task scheduling in flight simulators, i.e., developing a Task-Sequencer. Attention is focused on the possible application of some of the heuristic programming techniques, and an evaluation of their work for that specific purpose is made. 2 main applications for a Task-Sequencer are defined. The 1st involves the traditional training of students (flight crews) for flight vehicle operation, termed the operation-teaching mode. The 2nd is for the development of tactical skill, i.e., crew decision-making capabilities, termed the tactic-teaching mode. Algorithms for task sequencing in real time are formulated for both of these classes of applications. The only possible benefits in employing a heuristic programming scheme appear to exist when it is used for an ancillary role in the tactic teaching mode. This includes development of specific task flow diagrams and associated scoring charts. Finally, recommendations are made for further work.—*USAF AMRL*.

8328. McKnight, A. James. (Ed.) **Methods and devices for teaching data flow to electronics maintenance personnel.** *HumRRO res. Memo*, 1962, Task Trace I. iv, 60 p.—Trouble-shooting logic should be taught before concentrating on a particular system. Extended stress on particular systems should be limited "to those for which the man is being trained." 3 signal-flow simulators were developed for training and research. (19 diagrams & photographs.)—*R. Tyson*.

8329. Naylor, James C., & Briggs, George E. (Ohio State U.) **Effect of rehearsal of temporal and spatial aspects on the long-term retention of a procedural skill.** *J. appl. Psychol.*, 1963, 47(2), 120-126.—The study examined several rehearsal techniques as means of facilitating the retention of a discrete procedural task. 4 rehearsal conditions were defined as: whole task rehearsal, temporal rehearsal, spatial rehearsal, and no rehearsal. All groups were trained for 5 days, given 10 days of no practice, 5 days of rehearsal, 11 more days of no practice, and a retention test. The number of commissive errors showed significant retention differences, with the whole rehearsal group performing best. Omissive errors and reaction time did not show group differences. It was also found that Ss emphasized those metrics of performance which gave the most immediate feedback.—*Journal abstract*.

8330. Weschler, Irving R., & Schien, Edgar H. (Eds.) (Massachusetts Inst. Technology) **Issues in human relations training.** Washington, D. C.: National Education Association, National Training Laboratories, 1962. (NEA NTL Selected Readings Ser. No. 5) viii, 121 p. \$2.00.—This book is the 5th in a series bringing together papers published since

1945 by members of the National Training Laboratories staff on laboratory training in human relations. The volume consists of 10 papers, 2 original and 8 reprinted or adapted, by the editors or by 1 or more of 12 other authors. Topics include current status and extent of human relations training, theory and method, sensitivity training, management and organization development, the instrumented training laboratory, team training, ethical issues, trainer role, and training as a profession.—*B. V. Moore*.

8331. Wiener, Earl L. (U. Miami) **Knowledge of results and signal rate in monitoring: A transfer of training approach.** *J. appl. Psychol.*, 1963, 47(3), 214-222.—This study investigated the transfer effects of training with 3 signal rates and 3 levels of knowledge of results (KR) in a visual monitoring task. Each S monitored for 48 min. under 1 of 9 signal rate-KR conditions on Day 1. On Day 2 all Ss monitored under the medial signal rate with no KR. Results show: (a) on Day 1 mean probability of detection increased with signal rate and amount of KR, (b) these differences persisted on Day 2 when KR was withdrawn, and (c) commissive errors were higher with partial KR than with either full KR or none. It is concluded that training a monitor with KR and high signal rates may improve performance when he must monitor with low signal rates and no feedback. (28 ref.)—*Journal abstract*.

TASK & WORK ANALYSIS

8332. Bass, B. M. (U. Pittsburgh) **Are motor response elements additive?** *Percept. mot. Skills*, 1962, 15(2), 433-434.—Although the elements of a work cycle are seldom independent of each other, simple addition of elemental times is still appropriate when more than 10 elements are to be combined, when the correlations among elements are above .5, or when differential weighting for the several elements would not vary much.—*W. H. Guertin*.

8333. Bergum, Bruce O., & Lehr, Donald J. (USA Air Defense Human Research Unit, Fort Bliss, Texas) **Effects of authoritarianism on vigilance performance.** *J. appl. Psychol.*, 1963, 47(1), 75-77.—An experiment was performed on the effects of authoritarian monitoring conditions upon vigilance performance. Two groups of 20 Ss each were employed. One group worked at a light monitoring task for a period of 135 min. without rest and alone. The second group worked at the same task for the same amount of time but was observed by either a commissioned or noncommissioned officer according to a random visiting schedule. Signal rate was 12 signals per hr. The results indicated a highly significant facilitation of detection performance resulting from observation by the officers. It was suggested that these conditions represent an extreme point along a dimension of perceived threat to the monitor.—*Journal abstract*.

8334. Kidd, J. S. (Ohio State U.) **Work team effectiveness as a function of mechanical degradation of the intrateam communication system.** *J. engng. Psychol.*, 1963, 2, 1-14.—Using a simulated radar air traffic control task requiring close coordination between team members, 3 experiments showed that: (a) team performance was degraded by high level channel noise combined with a marginal signal-

to-noise ratio, (b) a critical frequency range around 1500 cps. was more resistant to the effects of restricted bandwidth than either higher or lower frequencies, and (c) increasing channel-off time from 0 to 30% resulted in a "near-linear" degradation in performance. (18 ref.)—*D. C. Hodge.*

8335. Nayyar, Ravi M., & Simon, J. Richard. (U. Iowa) Effects of magnification on a subminiature assembly operation. *J. appl. Psychol.*, 1963, 47(3), 190-195.—This experiment was designed to investigate the effects of magnification on the duration of elements of a subminiature assembly operation. The task consisted of grasping a metal dot .010 in. in diameter with a tweezers, transporting it to a hole, and dropping it into the hole. Ss used a binocular type industrial microscope and performed under 3 magnifications, 20X, 30X, and 40X. Precision of the task was varied by changing the diameter of the hole into which the dot was assembled. Results indicated that no single magnification was optimum for all elements. For pick up and travel loaded, 30X was optimum while for travel unloaded, 20X was optimum. Results for the assemble element were inconclusive. There was no evidence that the optimum magnification is dependent upon the precision requirements of the task.—*Journal abstract.*

WORK ENVIRONMENT & PERFORMANCE

8336. Fletcher, J. L., Loeb, M., & Harker, G. S. Field evaluation of the hazard to hearing of a proposed 25 meter range to personnel wearing ear protective devices. *USA Med. Res. Lab. Rep.*, 1962, No. 555. ii, 11 p.—Sound pressure level (SPL) measurements were made and audiometric data obtained on soldiers firing on a prototype range, on the same range redesigned, and upon the redesigned range with sound-deadening material installed. The soldiers were protected at all times while firing by 1 of 3 different ear-protective devices: 2 insert-type and 1 muff-type device. Results showed no significant difference in the temporary threshold shifts associated with the use of any of the 3 different protective devices or any of the 3 firing points. The redesign and sound-deadening efforts reduced the temporarily integrated SPL for the prototype range by 8 db.—*USAMRL.*

8337. Groth, Hilde, & Lyman, John. (U. California, Los Angeles) Measuring performance changes in highly transient extreme heat stress: Rationale, problem, and experimental procedures. *USAF AMRL tech. docum. Rep.*, 1963, No. 63-1. iv, 22 p.—A review of the existing state of the art for handling human performance under transient heat stress has been made. It was concluded that it would be necessary to develop a new methodology based on "micro-performance" measurements to assess severe localized transient heat stresses as relevant to contemporary flight problems. The test procedure proposed is based on the rationale that a primary task with difficulty that can be varied according to S error in order to maintain a relatively constant S performance level can be used as a measure of the moment-to-moment perceptual load. In addition to the primary task, secondary tasks have been suggested to help simulate problems in decision-making and verbal communication. (45 ref.)—*USAF AMRL.*

8338. Kasten, Duane F. Human performance in a simulated short orbital transfer. *USAF AMRL tech. docum. Rep.*, 1962, No. 62-138. v, 39 p.—Human performance was measured in a simulated short-range, coplanar orbital rendezvous task. Orbital conditions and vehicle dynamics were programmed on an analog computer. 2 systems of vehicle control and 1 system of information display were investigated. Performance criteria included impact velocity, fuel consumption, and transfer time required. Comparisons were made between control systems and between initial conditions. Ss' performance was better with an orthogonal-axes, thrust-control system than with a pitch attitude and 1-axis thrust-control system. The simulated direct-vision target display was found to be marginally acceptable. Suggestions about control systems and rendezvous techniques are included in the report.—*USAF AMRL.*

8339. Kennedy, J. E., & Landesman, J. (U. Wisconsin) Series effects in motor performance studies. *J. appl. Psychol.*, 1963, 47(3), 202-205.—It was hypothesized that a series effect would operate in a study designed to determine the optimal work surface height for the performance of a simple motor task. Under Condition A, Ss performed the task at each of 6 work surface heights, comprising the lower $\frac{2}{3}$ of the range of heights used in an earlier study. Under Condition B, Ss performed at 6 heights comprising the upper $\frac{2}{3}$ of the range. Systematic differences were observed in the performance of the 2 groups at the 4 heights they had in common. The differences in motor performance were attributed to a series effect stemming from differences in judgments Ss made concerning what the optimal height should be.—*Journal abstract.*

8340. Kerr, Willard A., & Keil, Rudolph C. (Illinois Inst. Technology, Chicago) A theory and factory experiment on the time-drag concept of boredom. *J. appl. Psychol.*, 1963, 47(1), 7-9.—47 (81%) of 53 personnel of a small plant guessed how much and in which direction the "erroneous" (but actually correct) company clocks were in error, in order to test hypothesis that, contrary to popular notion, time drag is estimated as greater in the variety-type than in the repetitive-type jobs. Significant correlations ($p < .05$) of time drag with variety-type (.43) rather than monotony-type, and with long-cycle (.27) rather than short-cycle jobs resulted. Time drag actually was greater in variety-type and in long-cycle jobs. The hypothesis that unbroken visual space seems tenable.—*Journal abstract.*

8341. Kulwicksi, Philip V., Schlei, Edward J., & Vergamini, Paul L. Weightless man: Self-rotation techniques. *USAF AMRL tech. docum. Rep.*, 1962, No. 62-129. iv, 40 p.—To be an effective weightless worker, an individual must be able to achieve and maintain a stable attitude with respect to his vehicle. If the worker is to have this capability, he must be able to control both translation and rotation. Translation may not be controlled without hardware, whereas rotation may. The purpose of this study was to investigate the possibility of body rotation by limb manipulation. This self-rotation is analyzed by the application of theoretical mechanics to a rigid mathematical model composed of 6 cylindrical segments. A quantitative evaluation, based on the

mathematical model, is made for one maneuver to determine the expected degree of rotation. As a result of this analysis, a series of selected maneuvers are proposed to give man the capability for rotation about 3 mutually perpendicular axes. The 9 maneuvers are intended to provide an effective rotation, while reducing undesirable coupled rotations. In addition, the stability of rotation of various geometrical shapes is investigated to determine if man can expect a self-rotation maneuver to be stable.—*USAF AMRL*.

8342. Lewis, John W. A partial review of the literature on physiological disorders resulting from the operation of motor vehicles. *USA ordn. Hum. Engng. Lab. tech. Memo.*, 1962, No. 17-62. v, 18 p.—A review of available literature on physiological difficulties arising from riding and driving automotive vehicles is presented. Findings indicate that a number of physical complaints show causes arising from the shocks and vibrations transmitted to the operator as a result of inadequate consideration of seating and suspension. (21 ref.)—*USA OHEL*.

8343. Maier, Norman R. F., & Hoffman, L. Richard. (U. Michigan) Seniority in work groups: A right or an honor? *J. appl. Psychol.*, 1963, 47(3), 173-176.—In the New Truck Problem, a role playing case, George, the senior man, receives the truck most often. What happens when he is absent? George received the new truck in 48.5% of 103 student groups who role-played the standard case, but in 73.2% of the 41 groups where he was absent (p difference $< .01$). Bill, the next most senior man, received the truck significantly ($p < .01$) less often when George was absent and was not compensated with George's truck. Nevertheless, Bill was not more often dissatisfied. Seniority may be an honor, not a right, and not readily claimable by the senior man. Also group members are often willing to sacrifice personal gain for the group's benefit.—*Journal abstract*.

8344. Micheli, F. Alcune considerazioni sul problema dell'affaticamento nel lavoro intellettuale con particolare riferimento all'attività del dirigente. [Some considerations on the problem of fatigue in intellectual work with special reference to the activity of the executive.] *Difesa soc.*, 1961, 40 (4), 85-97.—Intellectual fatigue is related to status conflict and to the various roles of the executive in his relationship to the complex managerial hierarchy.—*L. L'Abate*.

8345. York, C. (American Inst. Research) Behavioral efficiency in a visual monitoring task as a function of signal rate and observer age. *Percept. mot. Skills*, 1962, 15(2), 404.—The analyses of variance indicate for this particular sample and performance demand that an increase in either signal frequency or in age of the monitoring individual does not produce significant performance variation. Although a downward trend was observed in the course of time in the detection task, the vigilance decrement was not greater than that attributable to random sampling error. If one adheres to the expectancy hypothesis, O ability to estimate regular intervals—even if at various signal rates—was precluded by the use of irregular intersignal intervals. But, the lack of significant differences among age groups in a vigilance task seems to be more a function of an

insensitive task for the institutionalized population.—*W. H. Guertin*.

Motivation, Attitudes, Traits

8346. Ando, Mitsuo. A comparative study on conceptual differences between the Japanese and American workers: An analysis of attitudes and complaints. *Tohoku psychol. Folia*, 1962-63, 21 (1-2-3), 55-82.—Several questionnaires were administered to American and Japanese workers. The latter showed more uncertain responses; more unfavorable attitudes toward management; no differences in "relations with fellow employees," "security," and "identification with company"; more concern about future prospects with the company; more complaints on wages, hours, welfare, and benefits. Japanese grievances against labor unions were also greater, primarily due to the shorter existence of union organization in Japan. Despite this, "I really feel part of this organization" was higher and seems a contradiction which must be further explored.—*G. Rubin-Rabson*.

8347. Kuhlen, Raymond G. (Syracuse U.) Needs, perceived need satisfaction opportunities and satisfaction with occupation. *J. appl. Psychol.*, 1963, 47(1), 56-64.—If major motives are satisfied in the context of work and career, then satisfaction with occupation should be a function of the discrepancy between personal needs and perceived potential of occupation for satisfying needs, particularly among those for whom occupation constitutes a major source of satisfaction (e.g., men rather than women), and in the instance of occupationally relevant needs, such as need achievement. The Edwards Personal Preference Schedule, a special rating scale, and a questionnaire were administered to 108 men and 95 women teachers. As predicted, discrepancy scores correlated .25 ($p < .01$) with occupational satisfaction for men, and .02 (ns) for women. Achievement need discrepancies were consistently related to occupational satisfaction. Other findings confirmed that occupation is psychologically more central for men.—*Journal abstract*.

8348. Meltzer, H. (Washington U., St. Louis) Age differences in status and happiness of workers. *Geriatrics*, 1962, 17(12), 831-838.—A group of 141 workers in an industrial setting were asked to rank order 5 spans of years in terms of the best years of life for themselves and then how they thought others would rank them. The years most preferred were in the span 20-35 for self and up to 20 for others. Unfavorable years begin at 45.—*D. T. Herman*.

8349. Ronan, W. W. (Mesta Machine Co.) Work group attributes and grievance activity. *J. appl. Psychol.*, 1963, 47(1), 38-41.—5 hypotheses concerning the relation of grievance submission to nature and setting of work activity were tested. The hypotheses were that a particular plant has no effect on grievance submission, number of grievances submitted has no relation to nature of work, number of grievances "won" has no relation to nature of work, grievance goals do not vary by nature of work, rate of grievance submission is not related to nature of work. Results showed grievance submission does vary by plant and certain work groups won more grievances. The other 3 hypotheses were not supported. However, an overall tabulation of grievance activity makes all results somewhat tenuous.—*Journal abstract*.

MANAGEMENT & ORGANIZATION

8350. Carp, Frances M., Vitola, Bart M., & McLanathan, Frank L. (Trinity U.) Human relations knowledge and social distance set in supervisors. *J. appl. Psychol.*, 1963, 47(1), 78-80.—Postal supervisors' knowledge of human relations as measured by an adapted Air Force test and their perceptual set for social distance as measured by Fiedler's ASo Scale correlated significantly with productivity of subordinates as measured by the United States Postal Department Work Production Standard averaged over the period of 1 year. Effective leaders knew proper human relations practices and their perceptual set enabled them to maintain optimal psychological distance from subordinates, neither so close that they were hampered by emotional ties nor so distant that they lost emotional contact. Results suggest that selection of Postal Department supervisors would be improved by eliminating candidates whose scores fall beyond 1 sigma from the mean on the social distance scale; and from those remaining, taking the number required with the highest relations knowledge scores.—*Journal abstract.*

8351. Eaton, M. T. (U. Nebraska) Executive stresses do exist, but they can be controlled. *Personnel*, 1963, 40(2), 8-18.—Stresses inherent in the executive job and personality are discussed. Suggestions are offered for coping with them.—V. S. Sexton.

8352. Goodstein, Leonard D., & Schrader, William J. (U. Iowa) An empirically-derived managerial key for the California Psychological Inventory. *J. appl. Psychol.*, 1963, 47(1), 42-45.—Chi square comparisons of the responses of 603 managers and supervisors with those of 1748 men-in-general indicated that 206 of the 480 California Psychological Inventory (CPI) items reliably ($p < .01$) differentiated the 2 groups. All of the managerial and men-in-general CPI protocols were then scored using these 206 items as a Managerial key. This key not only reliably differentiated the total managerial group from the men-in-general group but also differentiated personnel at 3 different levels of management: top management, middle management, and first-line supervision (all p 's $< .01$). This CPI Managerial scale also significantly correlated ($r = .233$) with ratings of success within the total management group and within the top and middle management subgroups (r 's = .254 and .267, respectively). These results were compared with results of other recent personnel research and the implications discussed.—*Journal abstract.*

8353. Hoffman, F. O. (Marquardt Corp., Van Nuys, Calif.) The all-purpose manager: Does he exist? *Personnel*, 1963, 40(1), 8-16.—The proponents of "professional management" argue that a good manager can handle any managerial job. Practicing managers often resist this argument. The author claims that both are right because they are talking about 2 different things. If understanding is to be achieved, both groups must recognize where the confusion has arisen. The theorists must admit that the skills requisite for managing a particular field of work are shaped by specialized training and experience and hence are rarely interchangeable. On the other hand, practicing managers must realize that

all managerial jobs have a common denominator: the responsibility for seeing to it that the organizational machinery through which the work gets done runs and continues to run at peak efficiency.—V. S. Sexton.

8354. Kushner, A. People and computers. *Personnel*, 1963, 40(1), 27-34.—When management explores the feasibility of switching to electronic data processing, "people problems" emerge. The success of conversion to such processing often depends more on the human reactions than on the equipment itself. The author presents a step-by-step guide that should help solve the major "people problems" occasioned by computer installation.—V. S. Sexton.

8355. McConkey, Dale D. (United Fruit Co., Boston, Mass.) Measuring managers by results. *Personnel J.*, 1962, 41(11), 540-546.—The usual performance appraisal or merit rating reports are of little value in judging managers' performance because of lack of criteria for judging. In some managerial jobs, the managers can be evaluated by the profits or by the costs. In other managerial jobs, such as staff jobs, specific objectives should be set to be reached in certain time limits so that the managers can be judged by their actual performance in reaching the objectives. Interim evaluations are useful in determining progress, revising objectives and eliminating unsatisfactory managers.—M. B. Mitchell.

8356. Porter, Lyman W. (U. California, Berkeley) Job attitudes in management: II. Perceived importance of needs as a function of job level. *J. appl. Psychol.*, 1963, 47(2), 141-148.—By means of a questionnaire, 1916 managers indicated the degree of importance they attached to 13 items representing 5 areas of psychological needs. Respondents represented all levels of management and many different types of companies. The 5 need areas were Security, Social, Esteem, Autonomy, and Self-Actualization. Results showed that there was some relationship between vertical level of position within management and degree of perceived importance of needs. Higher-level managers placed relatively more emphasis on Self-Actualization and Autonomy needs than did lower-level managers. For each of the other 3 types of needs, however, there were no differences between responses from higher-level vs. lower-level managers. The findings from this study were compared with those from recent related studies.—*Journal abstract.*

8357. Prien, Erich P. (Western Reserve U.) Development of a supervisor position description questionnaire. *J. appl. Psychol.*, 1963, 47(1), 10-14.—A study of the job duties of factory foremen. A Supervisor Position Description Questionnaire (SPDQ) was developed and administered to 24 factory foremen and the corresponding supervising executives. An inverse interbattery factor analysis was performed. 7 factors were obtained and titled: Manufacturing Process Supervision; Manufacturing Process Administration; Employee Supervision; Manpower Coordination and Administration; Employee Contact and Communication; Work Organization, Planning, and Preparation; and Union Management Relations. A 2nd factor analysis of SPDQ scores yielded 2 factors titled: Manufacturing Operations Management and Administration, and Manpower Management and Utilization. The factors are

compared to those obtained by Hemphill (1961) and to the results of leadership studies.—*Journal abstract.*

ENGINEERING PSYCHOLOGY

8358. Edwards, Ward. Probabilistic information processing in command and control systems. *USAF ESD tech. docum. Rep.*, 1963, No. 62-345. 34 p.—This report discusses the diagnostic function in command and control systems. It presents Bayes's theorem of probability and examines its role in the design of command and control systems that process fallible information probabilistically. After summarizing existing relevant experimentation, the report points out major unsolved technical problems and outlines a program of research for solving some of them. Central to such a program is an examination of the feasibility and performance characteristics of such systems in a context which, while still experimental and abstract, is more realistic than that of the usual psychological experiment. The report examines characteristics of such a semi-realistic context. It lists substantive questions to be studied in this experimental setting. Finally, it specifies the resources required for these experiments and for the broader research program.—*USAF ESD.*

8359. Jordan, Nehemiah. (Rand Corp.) Allocation of functions between man and machines in automated systems. *J. appl. Psychol.*, 1963, 47(3), 161-165.—With the growing complexity of the man-machine systems the problem of allocation becomes more critical. Little progress has been made towards its solution since the publication of Fitts' article in 1951 which has dominated thinking in this area. Fitts recommended that man be compared to machines and be chosen for those functions which he does better than machines and vice versa. To do so is wrong; when we can compare a man to a machine, we find that we can also build a machine for the function involved. Hence the lack of progress. Men and machines are complementary, rather than comparable. Once the problem is so reformulated, new ways of thinking which appear to be promising open up.—*Journal abstract.*

8360. Leplat, Jacques. Dispersion des signaux et niveau de vigilance. [Dispersion of signals and level of vigilance.] *Annee psychol.*, 1962, 62(1), 17-28.—Printed letters were exposed at a given speed. Detection frequency increased with the distance of the signal perceived immediately beforehand when intersignal intervals were regular. When the intersignal intervals were varied, the average vigilance was slightly lower and interindividual variability was slightly greater.—*G. Rubin-Rabson.*

8361. Poulton, E. C. (Medical Research Council Applied Psychology Research Unit, Cambridge, England) Peripheral vision, refractoriness and eye movements in fast oral reading. *Brit. J. Psychol.*, 1962, 53(4), 409-419.—Naval ratings read typescript aloud through a window whose speed and size varied systematically in different trials. Eye movements were recorded electrically. Errors increased significantly as the window was reduced from a full line to 5 words, probably as a result of the tighter pacing and reduced peripheral vision. Regressions were unaffected. This is a serious criticism of reading films using windows to "improve" the reading of adults. Errors rose steeply to 40% as the time for

which letters were exposed fell from 0.3 to 0.2 sec.; fixations did not increase in frequency. Thus in reading the visual system behaves like a single-shot camera firing at not more than about 5 times per second. (18 ref.)—*Journal abstract.*

8362. Winick, Charles. (NYC) Preference for individual digits. *J. gen. Psychol.*, 1962, 67(2), 271-281.—A tally was made of the individual digits recorded on rolls of paper in an adding machine left on the sidewalk on a busy New York City street, on the assumption that passersby who hit numbers on the machine would be indicating a pure number choice by the numbers they selected. The numbers selected, on the basis of 55,375 recorded digits, were 1, 2, 4, 3, 5, 0, 9, 6, 7, 8, in order of their frequency. Their distribution was fairly close to normal. The numbers which were relatively more popular than their expected place in the linear scale of numbers would make possible (0, 4, 9), may have been especially popular because of the operation of the principles of closure and outstandingness. These results differ radically from Yule's analysis of final digits selected in interpolations, in which zero was the preferred number and the other numbers were all within \pm one standard deviation from the mean.—*Author abstract.*

Displays

8363. Baker, James D., & Whitehurst, Albert J. (USAF Electronic Systems Division, Bedford, Mass.) A comparison of two logic symbol coding techniques. *J. engng. Psychol.*, 1963, 2, 22-31.—"One technique [using 40 Ss] employed Shape encoding to differentiate basic logic functions; the other used Alphabetic identifiers. The findings showed that using Shape encoded symbols in simulated detailed logic diagrams resulted in a significant reduction in the time required to solve maintenance problems."—*D. C. Hodge.*

8364. Gibbs, C. B. (Defence Research Medical Lab., Toronto, Canada) Methodology of gain studies in man-machine systems. *Psychol. Bull.*, 1963, 60(2), 147-151.—There are considerable difficulties in communicating data concerning the output/input amplitude relations of man-machine systems, and many arise from a lack of agreement on terminology and methods of measurement. The many different terms in use are compared for their clarity and convenience. The uniform use of the term "gain" is recommended; and the terms control gain, display gain, and system gain are defined and distinguished. Linear measures are generally used in studies of gain, but radial measures are superior for describing optimal limb movements for controlling machines. (19 ref.)—*Journal abstract.*

8365. Hawkes, Glenn R. (FAA Civil Aeromedical Research Inst., Oklahoma City) Absolute identifications of cutaneous stimuli varying in both intensity level and duration. *FAA Civil Aeromed. Res. Inst. Rep.*, 1962, No. 62-16. 6 p.—Groups of naive and experienced Ss made absolute identifications of electrical cutaneous stimuli during 10 test sessions. Sessions consisted of various stimulus combinations of duration and "stridence" (subjective intensity). Experienced Ss transmitted significantly more information (I_t) than naive Ss when sessions contained an unequal number of durations and stridence levels.

No group differences appeared when the number of durations and stridence levels was equal, and both groups performed better when sessions were duration-weighted rather than stridence-weighted. Maximum I_t was obtained with 4×4 duration-stridence combinations. Results are compared with data obtained with unidimensional stimuli.—*W. E. Collins.*

8366. Mackworth, Jane F. (Defence Research Medical Lab., Toronto, Canada) Effect of reference marks on the detection of signals on a clock face. *J. appl. Psychol.*, 1963, 47(3), 196-201.—42 female Ss were employed in each of 3 studies undertaken to determine the effect of white marks on a black clock face on the detection of signals, consisting of brief pauses of the clock hand. The signals were presented at intervals ranging from 5-14 sec.; 0-30 marks were used. The addition of 1 mark reduced the percentage of missed signals to half that of the blank face ($p < .01$). Least signals were missed when they were near the white mark. Conclusions are the detection of a brief pause in a clock hand is improved by the addition of reference marks and there is a rapid decrease in detection of frequent signals as the run continues.—*Journal abstract.*

8367. Robinson, John E., Jr., & Cook, Kenneth G. (Applied Psychology Corp., Arlington, Va.) A flight simulator test of an altitude-coded aircraft light. *J. engng. Psychol.*, 1963, 2, 15-21.—6 pilots made judgments of relative altitude and vertical flight path of a simulated target aircraft using a modified F-100/151 flight simulator and aerial gunnery trainer. Ss were tested with pre-arranged problems involving 3 rates of altitude change and a number of collision courses and vertical misses. Accuracy of determining the vertical flight path was better with an altitude-coded light, using dot-dash signals, than with an uncoded light having a fixed-frequency flash rate. Altitude coding also yielded more accurate judgments of target relative altitude. For both lights, faster rates of altitude change yielded less accurate judgments of relative altitude, and more accurate judgments of the vertical flight path.—*D. C. Hodge.*

8368. Severin, Francis T., & Rigby, Marilyn K. (St. Louis U.) Influence of digit grouping on memory for telephone numbers. *J. appl. Psychol.*, 1963, 47(2), 117-119.—4 distinct patterns of 60 7-digit numbers were compared for accuracy of dialing by 96 college students. The patterns consisted of the following number of digits separated by hyphens: 3-4, 1-3-3, 2-2-3, and 1-2-2-2. A memory drum was used for presentation of the digits and a telephone for dialing. The tapes for the memory drums contained 4 lists of the same digits, the lists differing in the pattern for each set of digits and in the sequence of the patterns. Data analyzed in a $4 \times 4 \times 4$ design for repeated measurement showed the 3-4 pattern, the pattern in current usage, to be superior to the others ($p < .01$).—*Journal abstract.*

8369. Weiss, Robert. (Lear Siegler, Inc., Grand Rapids, Mich.) Display systems for sub- and zero-gravity flight. *USAF AMRL tech. docum. Rep.*, 1963, No. 63-11. x, 54 p.—A study was performed of the controls and pilot displays used to fly a C-131B and KC-135 aircraft in a Keplerian trajectory to create zero-gravity conditions. Evaluation criteria for this maneuver were proposed and applied to 2 basic instrumentation systems which were de-

veloped. An analog simulation was formulated and these results will be used to further improve the systems. Recommendations are made for improved instrumentation which should enable consistent flights of 10 sec. at zero-gravity plus or minus 0.005 g. (26 ref.)—*USAF AMRL.*

Controls

8370. Newman, Klaus M. (USN Electronics Lab., San Diego) Information entry efficiency on two experimental binary coded keysets. *J. engng. Psychol.*, 1963, 2, 32-43.—5 Ss were tested for speed and accuracy of information entry on 2 binary-coded decimal keysets. It was concluded that: "(a) Both qualitative and quantitative data of a 29-bit word could be entered accurately and rapidly using a 4-key binary-coded decimal keyboard; (b) keyset design had a direct bearing on the speed for error trade-off by operators; (c) encoding tasks, if kept fairly simple, could be carried out by experienced operators as part of information entry without detriment to the over-all process; and (d) patterned key pressing by the 'touch' system could be used successfully . . . by trained operators."—*D. C. Hodge.*

8371. Warrick, M. J., & Turner, Lester. Simultaneous activation of bimanual controls. *USAF AMRL tech. docum. Rep.*, 1963, No. 63-6. iii, 11 p.—The time interval between the release of a right-hand key and a lefthand key, when Ss were attempting to release them simultaneously, was measured to 0.1 millisecond. The mean interval of 20 Ss, 60 trials per S without knowledge of results, was very close to zero (simultaneous). Approximately 94% of the intervals were within ± 20 millisecond of zero. The implications of the findings to the control of a personal space-propulsion unit are discussed.—*USAF AMRL.*

SIGNS & LEGIBILITY

8372. Krylov, A. A. (Leningrad, USSR) Vliyanie velichiny melkikh delenii na chitaemost' shkal strelnochnykh kontrol'no-izmeritel'nykh priborov. [Effect of the size of small divisions on the readability of the dials of measurement control devices.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1962, No. 3, 95-97.—5 trained Ss were asked to read round dials of 5 different sizes while their RT was recorded. It was found that the readability of the dials is a function of the angle of small divisions. The angle was measured from the line S—center of the dial—which was 1 m.—*A. Cuk.*

DRIVING, ACCIDENTS, SAFETY

8373. Barmack, Joseph E. Methodological problems in the design of motor vehicle accident research. *Amer. J. publ. Hlth.*, 1962, 52(11), 1866-1871.—The author discusses some of the methodological difficulties in the study of motor vehicle accidents. While the study of this problem has aspects which resemble those that have led to control of other diseases, a number of aspects are different. The need for direct evidence of the events preceding the trauma is stressed, as well as for the technology to obtain such data.—*Journal abstract.*

8374. Cobliner, W. Godfrey, & Shatin, Leo. (Seton Hall Medical Coll.) An adaptational per-

spective on the traffic accident. *Traf. Saf. res. Rev.*, 1962, 6(4), 13-15.—This is a new theoretical approach to the problem of traffic accident causation. It presents a model of psychological forces and counterforces which govern driving behavior. The psychological forces are balanced under normal circumstances. However, when the driver passes through a critical life period the former equilibrium is upset. This greatly increases the likelihood for an accident.—*Author abstract.*

8375. Smart, R. G., & Schmidt, W. S. (Alcohol & Drug Addiction Research Found., Toronto, Canada) Psychosomatic disorders and traffic accidents. *J. psychosom. Res.*, 1962, 6(3), 191-197.—Of 271 male hospitalized gastric or duodenal ulcer patients 136 had drivers' licenses during the 3½ years studied. The ulcer patients had significantly more accidents per capita than did the general driving population.—*W. G. Shipman.*

8376. Thorndike, Robert L. The human factor in accidents with special reference to aircraft accidents. Washington, D. C.: United States Department Health, Education, & Welfare, Public Health Service, 1962. viii, 175 p.—This is a reprint of a report originally published in 1951. The following conclusions are drawn: "(a) . . . systematic safety programs have led to reductions in accident rates. (b) Much of the literature on accident-proneness must be discounted because of inadequacies in the data or the procedures of analysis. . . (c) Many predictors, including measures of sensory, motor, intellectual, and personality qualities, have been studied in relation to accident records, and some have been found to show a slight relationship. . . (d) There is little satisfactory evidence as to the effect upon aircraft accident rate of any specific programs of training, retraining, or safety education." 9 recommendations are made for future research on aircraft accidents. (209 ref.)—*W. Coleman.*

ADVERTISING & CONSUMER PSYCHOLOGY

8377. Lucas, Darrell Blaine, & Britt, Steuart Henderson. (New York U.) Audience accumulation and combinations. Part I. *Media/scope*, 1962, 6(10), 42-45.—Both the research objectives for evaluating advertising media and the techniques for achieving those objectives have become essentially psychological. This 1st of 2 articles describes the quantitative objectives and terminology as well as the research solutions of methodology for measuring combined audiences of leading magazines and television programs.—*Author abstract.*

8378. Lucas, Darrell Blaine, & Britt, Steuart Henderson. (New York U.) Audience accumulation and combinations. Part II. *Media/scope*, 1962, 6(11), 42-45.—This 2nd of 2 articles continues the discussion of psychological concepts for quantitative evaluation of advertising media—namely, the measurement of total reach, duplication, accumulated and combined reach—together with the theory of design of psychologically sound measuring methods. This is followed by recommendations on how and when to use such data.—*Author abstract.*

8379. Lucas, Darrell Blaine, & Britt, Steuart Henderson. (New York U.) What's wrong with ad research? *Printers Ink*, 1962, 280(10), 48-50.—Because of problems in forming a concept as well as inadequacies of measurement, existing qualitative media research constitutes a highly controversial area. Indirect approaches and objective approaches may help in the measurement of audience attitudes.—*Author abstract.*

8380. Salunke, D. K., McLaughlin, R. L., Day, Sandra L., & Merkley, Margaret B. (Utah State U.) Preparation and quality evaluation of processed fruits and fruit products with sucrose and synthetic sweeteners. *Food Technol.*, 1963, 17(1), 85-91.—Cherries, apricots, and peaches were prepared with varying amounts of sucrose or with sucrose in various combinations with calcium cyclamate and sodium saccharin. Products were served at regular meals by 50 families and judged as acceptable or unacceptable by 117 family members, and rated on a like-dislike scale by a trained laboratory panel of 10 members. Percent acceptable correlated +.70 with panel results. Products with moderate levels of sucrose or with low sucrose plus low levels of synthetic sweeteners were best liked. When sucrose concentration was increased, products were too sweet. Higher concentrations of synthetic sweeteners caused a bitter aftertaste.—*D. R. Peryam.*

8381. Szczesniak, Alina Surmacka, & Kleyn, Dick H. (General Foods Corp., Tarrytown, N. Y.) Consumer awareness of texture and other food attributes. *Food Technol.*, 1963, 17(1), 74-77.—100 Ss each gave 3-word associations to the names of 74 common foods. Menu-used responses were most frequent (38.3%) followed by food-attribute responses (23.7%), including texture (7.6%), flavor (6.3%), and color (3.8%). Foods which elicited the highest number of texture responses were either bland in flavor or were crunchy or crispy. Most Ss' texture vocabularies were limited. Terms denoting different degrees of hardness, cohesiveness, and moisture content were mentioned most often.—*D. R. Peryam.*

BRIEF SUBJECT INDEX

This index supplements, but does not duplicate, the classification of abstracts given in the Table of Contents. It is assumed that the reader will have scanned whatever categories of classification interest him and that he will use this index only for cross references or for subjects that are more specific than the general categories of the classification. When many numbers are encountered under a heading, the reader may simplify his task by matching the numbers found under the two or more headings that specify his particular interest.

Psychological Abstracts

VOLUME 37

DECEMBER 1963

NUMBER 6

LIST OF JOURNALS REGULARLY SEARCHED

The number of journals regularly searched by *Psychological Abstracts* now totals 537. Coverage categories are indicated by type face: **bold-faced** journals are received and assigned to abstracters by the editorial office; light-faced journals are searched by the abstracter. The notation "Journal abstract" indicates reproduction of the abstracts which appear in the original publication; "Author abstracts" are submitted by the individual authors especially for publication in *Psychological Abstracts* and do not appear in the original publication. In those cases where no abstracter is indicated, the journal is temporarily unassigned.

- Acta Academiae Paedagogicae Jyväskyläensis.** Now: *Jyväskylä Studies in Education, Psychology and Social Research and Studia Historica Jyväskyläensis.*
- Acta Biologiae Experimentalis.** (*Acta Biol. exp., Warsaw*) (Church, R. M.)
- Acta Chromatica.** (*Acta chrom., Japan*) (Journal abstracts)
- Acta Geneticae Medicae et Gemellologiae.** (*Acta genet. med. gemellolog., Rome*) (Journal abstracts)
- Acta Neurologica et Psychiatrica Belgica.** (*Acta neurol. psychiat. Belg.*) (Sanua, V. D.)
- Acta Neurologica Scandinavica.** (*Acta neurol. Scand., Copenhagen*) (Kaelbling, R.)
- Acta Neuropsychiatria Argentina.** Now: *Acta Psiquiátrica y Psicológica Argentina.*
- Acta Ophthalmologica.** (*Acta ophthal., Copenhagen*) (Katz, M. S.)
- Acta Oto-laryngologica.** (*Acta oto-laryngol., Stockholm*) (Loeb, M.)
- Acta Paedopsychiatrica.** (*Acta paedopsychiat., Basel*) (Rubin-Rabson, G.)
- Acta Pharmacologica et Toxicologica.** (*Acta pharmacol. toxicol., Copenhagen*)
- Acta Psiquiátrica y Psicológica Argentina.** (*Acta psiquiat. psicol. Argent.*) (Meissner, W. W.) Formerly: *Acta Neuropsychiatria Argentina.*
- Acta Psychiatrica Scandinavica.** (*Acta psychiat. Scand., Copenhagen*) (Kaelbling, R.)
- Acta Psychologica.** (*Acta psychol., Amsterdam*) (Rubin-Rabson, G.)
- Acta Psychologica Sinica.** (*Acta psychol. Sinica*) (Journal abstracts)
- Acta Psychotherapeutica et Psychosomatica.** (*Acta psychother. psychosom., Basel*) (Rubin-Rabson, G.)
- Acta Universitatis Carolinae, Philosophica et Historica.** (*Acta U. Carolinae phil. hist.*) (Bruml, H.)
- Activitas Nervosa Superior.** (*Activ. nerv. super., Prague*) (Břicháček, V.)
- Administrative Science Quarterly.** (*Admin. Sci. Quart.*) (Sexton, V. S.)
- Advanced Management-Office Executive.** (*Advanc. Mgmt.-Off. Exec.*) (Miller, E. Q.)
- Advertising Age.** (*Adv. Age*) (Twedt, D. W.)
- Aerospace Medicine.** (*Aerosp. Med.*) (Loring, J. C. G.)
- Alberta Journal of Educational Research.** (*Alberta J. educ. Res.*)
- American Annals of the Deaf.** (*Amer. Ann. Deaf*) (Newland, T. E.)
- American Anthropologist.** (*Amer. Anthropologist*) (Sulzer, R. L.)
- American Behavioral Scientist.** (*Amer. behav. Scientist*)
- American Imago.** (*Amer. Imago*)
- American Journal of Clinical Hypnosis.** (*Amer. J. clin. Hypn.*) (Kline, M. V.)
- American Journal of Clinical Nutrition.** (*Amer. J. clin. Nutr.*) (Millon, T.)
- American Journal of Diseases of Children.** (*Amer. J. Dis. Children*) (Warren, A. B.)
- American Journal of Human Genetics.** (*Amer. J. hum. Genet.*) (Vandenberg, S. G.)
- American Journal of Mental Deficiency.** (*Amer. J. ment. Defic.*) (Sexton, V. S.)
- American Journal of Occupational Therapy.** (*Amer. J. occup. Ther.*) (Seidenfeld, M. A.)
- American Journal of Ophthalmology.** (*Amer. J. Ophthal.*) (Shaad, D. J.)
- American Journal of Optometry & Archives of the American Academy of Optometry.** (*Amer. J. Optom.*) (Heinemann, E. G.)
- American Journal of Orthopsychiatry.** (*Amer. J. Orthopsychiat.*) (Perl, R. E.)
- American Journal of Physical Medicine.** (*Amer. J. phys. Med.*) (Schubert, H. J. P.)
- American Journal of Physiology.** (*Amer. J. Physiol.*) (Peryam, D. R.)
- American Journal of Psychiatry.** (*Amer. J. Psychiat.*) (Pronko, N. H.)
- American Journal of Psychoanalysis.** (*Amer. J. Psychoanal.*) (Prager, D.)
- American Journal of Psychology.** (*Amer. J. Psychol.*) (Nance, R. D.)
- American Journal of Psychotherapy.** (*Amer. J. Psychother.*)
- American Journal of Sociology.** (*Amer. J. Sociol.*) (Journal abstracts)
- American Psychologist.** (*Amer. Psychologist*) (Lachman, S. J.)
- American Scholar.** (*Amer. Scholar*) (Russell, J. W.)
- American School Board Journal.** (*Amer. sch. Bd. J.*) (Amatora, S. M.)
- American Scientist.** (*Amer. Scientist*)
- American Sociological Review.** (*Amer. sociol. Rev.*) (Berkowitz, L.)
- Animal Behavior.** (*Anim. Behav.*) (Coppock, W. J.)
- Annales Médico-psychologiques.** (*Ann. med.-psychol.*) (De Palma, N.)
- Annals of Human Genetics.** (*Ann. hum. Genet.*) (Vandenberg, S. G.)
- Annals of the New York Academy of Sciences.** (*Ann. N. Y. Acad. Sci.*) (Aaronson, B. S.)
- Annals of Otolaryngology and Laryngology.** (*Ann. Otol. Rhinol. Laryngol.*) (Vernon, J. A.)
- Annals of Psychotherapy.** (*Ann. Psychother.*) (Glasner, S. Z.)
- Année Psychologique.** (*Annee psychol.*) (Rubin-Rabson, G.)
- Annual of Animal Psychology.** (*Annu. anim. Psychol., Tokyo*) (Ohwaki, S.)
